TAUGHT BY MAIL THOROUGH PRACTICAL

The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address

THE PELTON WATER WHEEL CO.,

121 MAIN STREET, SAN FRANCISCO, CAL.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated [illegible] such long and careful practice before the Office, and the frequent examination of patents already [illegible] for the purpose of determining the patentability of inventions brought before us, enables [illegible] advice which will save inventors the expense of applying for patents upon inventions which [illegible] Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Solicitors, [illegible] Market St., S.F. CHICAGO, ILL.

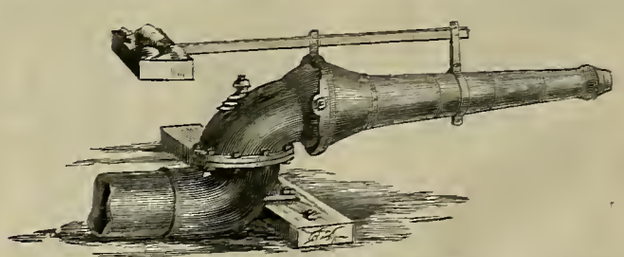
A REVOLUTION IN ORE PULVERIZING.

THE

Merralls Hydraulic Quartz Mill,

The Greatest Ore and Rock Pulverizer in the World, Either Wet or Dry.

THE ONLY MILL BUILT THAT RIVALS STAMPS. Our six-foot mill (No. 1) will reduce ore or rock to pulp than a ten-stamp mill, with less than one-half the power and less than one-half wear and tear, besides saving a much larger per cent of the gold in the ore.



This mill will reduce from 25 to 500 per cent more ore than any other rotary mill in use. Cheap, simple and economical. Four sizes built—from 15 to 250 tons capacity.

Send for Circular. Address

MERRALLS MILL COMPANY,

Room 12 Third Floor, Mills Building ..... San Francisco, Cal.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 42 Fremont St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 5, 1895.

Silver is steady; just about the same week after week. As nearly all the silver mines have closed down, the store diminishes. There is a foreign demand that is likely to enhance present figures. The useful metals are in greater prominence than the precious ones, and buoyant in price. The Western Bar Iron Association held a crowded conference at Cleveland, Ohio, last Tuesday, and decided to advance the price on all grades of bar iron $2 a ton.

The great activity in the electrical business has given copper a tremendous boom. Producers are now talking of fourteen-cent copper, as contrasted with ten cents a few months ago. Shortly will appear the strength of the market, as the heaviest producers will next week be again in the market with copper to sell.

New York Metal Market.

NEW YORK, Sept. 5.—PIG IRON—Southern, 11.50@14c; Northern, 12@14c.

COPPER — Brokers', 12.20 @ 12.25c; exchange, 12.10@12.15c.

LEAD—Brokers', $3.30; exchange, $3.50.

TIN—Straits, 14.40@14.55c.

SPELTER—Domestic, $4.20.

Mining Share Market.

SAN FRANCISCO, September 5, 1895.

The stock market was a heavy one this week. The denial by the Supreme Court of the motion of the defendants for a rehearing in the Hale & Norcross case sent that stock from $1.75 to $1.90 and stiffened some of the others a little. On Thursday the stock ran down from $1.80 to $1.65, and closed at $1.55, while the other stocks exhibited more strength and activity.

Sales at the regular sessions of the San Francisco Stock and Exchange Board for the mouth of August were 229,850 shares, and for the first eight months of the year 1,924,275 shares, as against 2,770,560 shares during the same time in 1894. The total for the same time in 1893 was 2,084,005 shares.

Mention was made last week that Supts. Lyman and Messer had gone to the Comstock to look at the Concordia and Monte Cristo claims on the Brunswick, which the Ophir and Mexican thought of buying. An adverse report has been filed.

The following is the usual monthly statement of moneys on hand:

BONIE MINES.		Crown Point	$10,844 00

Coast Industrial Notes.

—The Vulcan Iron Works is finishing a large double circular sawmill plant for South America.

—Stockton is endeavoring to secure the removal of the plant of the California Jute Mills from Oakland to that place. The mills in operation employ about 350 hands.

—At Signal, Mendocino Co., is established the first factory in this State for the manufacture of tannin extract. The ground bark is leached and the liquid evaporated.

—The Santa Clara Valley Railway Co. has incorporated, capital stock $100,000, to build a railroad eight miles from Alviso at the head of the bay to San Jose. A line of steamers will run from the former point to this city.

—The Fresno Board of Trustees have granted a franchise to the San Joaquin Electric Company for fifty years. The company proposes to bring power from the San Joaquin river to light the city and drive its cars and machinery, and has over 100 men at work.

—The current number of *Cassier's Magazine* has a well-written article on "Steam Engines of To-day," which, among its illustrations, has one of a sectional Corliss engine built by the Fulton Engineering and Shiphuilding Works and one of a slide-valve Corliss engine built by the Golden State and Miners' Iron Works.

—A man is engaged at Grass Valley in burning refuse bones. After the animal substance is burned out of the bones the charred and bleached remnants are sacked up and sent to San Francisco, where he receives from $20 to $60 per ton for the results of his labors. This bone product is used largely for the clarifying of sugar.

—A San Francisco man has bonded one of the old collieries on the northeast bank of Mount Diablo, and he proposes now to reopen the mine, establish a big steam electric plant, run wires to Oakland and furnish power to that city and all way stations. He says that the coal can be taken out of the Mount Diablo mines and put under the boilers for $1 a ton.

—The late J. C. Wilmerding of this city gave $400,000 in trust to the regents of the State University to establish "a school to teach boys trades by which they can earn a living with their hands, with plenty of work and not too much study." The money has been paid to the trustees, who will select a site and endeavor to comply with the testator's wishes.

—The Alcatraz Asphaltum Mining Company's refinery at Carpenteria, Santa Barbara Co., is lighted throughout by electricity and operated by a large force of men. Fifty-five men engaged in surface mining at the Carpenteria deposits are taking out 800 tons a month. The company has thirty men at the La Paera mines, ten miles west of Santa Barhara, taking out 700 tons monthly.

Assessment Notices.

KENTUCK CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the sixth day of August, 1895, an assessment (No. 11) of Ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 23, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the tenth day of September, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the first day of October, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

AUG WATERMAN, Secretary.

Office—Room No. 23, Nevada block, No. 309 Montgomery street, San Francisco, California.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Fairfax, Marin County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 23rd day of August, 1895, an assessment, No. 4, of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 21st day of October, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room No. 56, No. 309 Montgomery street, San Francisco, California.

SONORA EXTENDED MINING CORPORATION.—Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of August, 1895, an assessment, No. 3, of 2½ cents per share was levied upon the whole of the capital stock of the corporation, both paid and unpaid, payable immediately in United States gold coin to the Secretary, at the office of the company, 213 Jackson Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1895, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 28th day of October, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. A. STRATTON, Secretary.

Office, 213 Jackson Street, San Francisco, California.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 27) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Name.	No. Cert.	No. Shares.	Amt.
M. J. McDonald, Trustee	294	5,000	$ 00 00
M. J. McDonald, Trustee	295	1,000	100 00
M. J. McDonald, Trustee	296	1,000	100 00
M. J. McDonald, Trustee	298	1,000	100 00
M. J. McDonaid	453	250	25 00
M J. McDonaid, Trustee	454	2,823	282 30
Paul Lotz, Trustee	497	4,000	400 00
E. M. Frank, Trustee	292	8,000	800 00
E. M. Frank, Trustee	377	2,000	200 00
C. D. Rixford, Trustee	145	1,000	100 00
Mrs. Hattie C. Baggs	529	201	20 10
G. W. Lnee, Trustee	382	347	34 70
Alex. McLaughlin	302	200	20 00
Alex. McLaughlin, Trustee	360	122	12 20
Alex. McLaughlin, Trustee	444	200	20 00
Geo. Dillman	530	980	98 00
F. J. Sanders	384	98	9 80
F. J. Sanders	385	35	3 50
R. P. Rasmussen	415	100	10 00
R. P. Rasmussen	419	31	3 10
A. F. Thane, Trustee	448	1,073	107 30
A. F. Thane, Trustee	449	922	92 20
Chas. E. Anderson, Trustee	467	454	45 40
Chas. E. Anderson, Trustee	508	600	60 00
W. W. Sargeant, Trustee	460	378	37 80
W. W. Sargeant, Trustee	505	1,000	100 00
W. W. Sargeant, Trustee	518	1,000	100 00
W. W. Sargeant, Trustee	531	131	13 10
J. H. Isham	462	100	10 00
H. H. Noble, Trustee	523	4,000	400 00
Montgomery Baggs	528	100	10 00

And in accordance with law and an order of the Board of Directors made on the 5th day of July, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 12, Rotunda Mills Building, San Francisco, California, on WEDNESDAY, the 4th day of September, 1895, at the hour of one o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on September 4th, 1895, the above sale is postponed to FRIDAY, the 4th day of October, 1895, at the same place and time of day.

W. W SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, Cal.

WANTED!
A Gold Quartz or Copper Property,
With sufficient development work done to show up the property. Must stand a thorough and complete examination. None but a first-class property wanted. All information will be strictly confidential with buyer only. Send full particulars of property for sale.
M. KNOX,
12 Front Street.....San Francisco, Cal.

INVENTORS, Take Notice!
L. PETERSON, MODEL MAKER,
226 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential*.

LIGHTNING LARGEST WELL MACHINERY Works.
All kinds of tools. Fortune for the driller by using our Adamantine process; can take a core. Perfected Economical Artesian Pumping Rigs to work by Steam, Air, etc. Let us help you. THE AMERICAN WELL WORKS, Aurora, Ill.; Chicago, Ill.; Dallas, Tex.

In the new mechanics building of the University of California at Berkeley there are a number of very valuable instruments delicately adjusted for accurate experimenting. One of these is a recently invented machine for testing lubricating oils. In the East almost all of the determinations are made at the technical colleges and there is no reason why it should not be done here. Mr. Cheseborough, the machinist at the laboratory, held a similar position in the machine shops at Cornell University and is especially fitted for this kind of work. He has already made a number of valuable experimental tests for governmental officials here and there is no reason why oil producers throughout the State should not send in their samples and avail themselves of the well-equipped laboratory in determining the value and uses of their oils.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUGUST 27, 1895.

545,217.—STREET CAR BRAKE—H. T. Atkinson, Oakland, Cal.
545,222.—PRESERVING TIMBER—Curtis & Isaacs, S. F.
545,065.—THILL SUPPORT—W. L. Frazer, San Diego, Cal.
545,228.—HORSE-BREAKING APPARATUS—J. W. Green, Cotati, Cal.
545,291.—FARE REGISTER—S. C. Houghton, S. F.
545,298.—ELECTRIC RAILWAY—C. H. Johnson, San Jose, Cal.
545,164.—CABLE COUPLING—J. P. F. Kuhlmann, Seattle, Wash.
545,138.—VEHICLE—J. R. Simms, S. F.
545,319.—LOG-HAULING DEVICE—Van Duzer & Kirry, Scotia, Cal.
545,320—SPRINKLER—J. P. Van Sicklo, Pasadena, Cal.
545,183.—SAUCEPAN—R. B. Vanderhurgh, Long Beach, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DEVICE FOR SAVING VALUABLE AND PRECIOUS METALS.—James A. Bouk and Charles Bushnell of Santa Cruz, Cal. No. 544,880. Dated Aug. 20, 1895. The object of this invention is to save that portion of precious and valuable metals which is lost in passing over amalgamating plates and concentrators, and which escape in the form of chlorides and fine float, as well as sulphurets which are too fine and light to readily settle, these being technically called "slimes." The apparatus consists of a water-containing tank; an endless traveling belt having one end submerged therein, with means for delivering the ore upon the submerged end of the belt; spray pipes delivering water upon the belt after it has emerged from the tank, to cleanse the heavier portions and leave the slimes and soluble portions remaining within the tank; settling tanks and connections whereby the solution and slimes are delivered directly and continuously from the main tank to the settlers; a filter whereby the insoluble portions are arrested within the settling tanks and the solution allowed to pass therefrom, and means for again transferring the solution upon the belt and through the settling tanks until sufficiently charged with soluble matter for further treatment.

GAS ENGINE AND GENERATOR.—Daniel Best, San Leandro, Cal. No. 544,879. Dated Aug. 20, 1895. The object of this invention is to provide a convenient means for supplying an explosive gas or vapor to a gas engine directly from the crude petroleum or hydrocarbon supplying the hydrocarbon to the generator in small continuous charges, and removing the residue as fast as it accumulates. It consists of a vertically disposed generator consisting of an exterior case, an interior series of superposed and connected cones extending throughout a casing with a vertical central passage communicating at one side by its lower end with the passage from the exhaust of an engine; an opening through the top to the exterior case, a pipe by which the hydrocarbon is delivered upon the uppermost of the conical surfaces so that the liquid flows over the surfaces in a thin sheet and is acted upon and vaporized by the heat of the products of combustion from the engine escaping through the interior of the cones.

AMALGAMATOR.—George H. Chick, San Francisco, Cal. No. 545,011. Dated Aug. 20, 1895. This invention relates to an apparatus especially designed for saving precious or valuable metals where they occur in a finely divided condition, mixed with fine sand or tailings. It consists of rotary agitating and collecting cylinders in suitable containing chambers, these cylinders turning on horizontal axes having silvered or amalgamated cups fixed upon the periphery in series so that they open alternately in opposite directions and are adapted to dip into the pulp contained within the chamber or casing in which the cylinder rotates, so as to agitate the pulp and bring the material into intimate contact with the silvered or amalgamated surfaces. In conjunction with this is a preliminary receiving chamber into which the pulp is delivered, and agitators by which it is stirred up before being delivered into the main chamber.

WASHBURN & MOEN MFG. CO.

MAKERS OF

BARBED BALING COPPER INSULATED WIRE ROPE NAILS SPRINGS BALE TIES

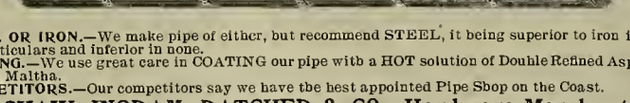
Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.



SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

Send for Catalogue and Price List. CORRESPONDENCE SOLICITED.

Mining Pipe!

STEEL OR IRON.—We make pipe of either, but recommend STEEL, it being superior to iron in many particulars and inferior in none.
COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.
COMPETITORS.—Our competitors say we have the best appointed Pipe Shop on the Coast.

Hydraulic Mine for Sale.

Not on a navigable stream; in northern California. Good dump; no trouble with tailings; 180 acres of mining ground; 5000 inches of water. Can work eight months in the year. Ample opportunity given a buyer to fully test the property before payment is made. For further details,
Address X, 2022 W St., Sacramento, Cal.

THE BLASDEL IMPROVED ORE CONCENTRATING BELT.

We are now having our belts made by the best rubber manufacturers in New York and Boston, under written guarantees both as to quality and mechanical construction.

We have been granted two United States patents for improved devices in concentrating belts, the first and most important of which is for a slight riffling of the surface at intervals and crosswise of the face of the belt.

While these riffles are only about one-thirty-second of an inch in depth, they are very effective in saving floured sulphurets and reclaiming quicksilver and amalgam that may escape from the plates, thus gaining a large percentage of values that would go off with the tailings from belts with entirely smooth surfaces.

Our second patent is for an improvement in the flanges which practical mill men will appreciate. They stand at an acute angle inwardly, therefore they thoroughly confine the pulp on the belt; and in passing over the end pulleys of the machine, lie partly down, consequently do not crack or break, as do the old-style flanges; thereby much vexation and loss is avoided. *We keep in San Francisco and New York belts of all lengths and widths suitable for all concentrators in general use.*

BLASDEL CONCENTRATING BELT CO., HAYWARDS BUILDING, 419 CALIFORNIA STREET, SAN FRANCISCO.

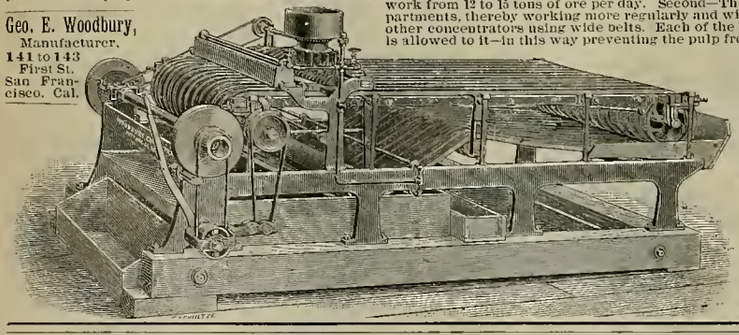
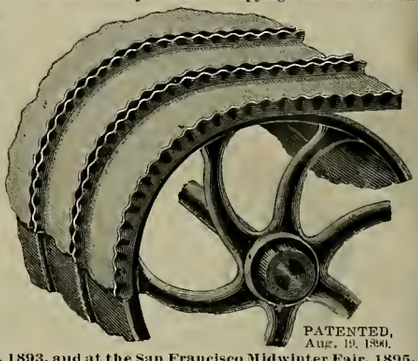
Johnston's Concentrator, Improved Bryan Mills,

Challenge Ore Feeders, Air Compressors,



KNIGHT WATER WHEELS—Highest Efficiency Guaranteed.



MINING, MILLING, PUMPING and HOISTING PLANTS.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891 MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect; Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.

PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

AND PACIFIC ELECTRICAL REVIEW.

OLUME LXXI. Number 11. SAN FRANCISCO, SATURDAY, SEPTEMBER 14, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

hree-Phase Long Distance Electrical Transmission for Mining Work.

An important applicatiou of the three-phase system of long distance transmission of power has recently heeu installed and put in operation at ic Silver Lake mines, near Silverton, Col., here power is transmitted a distance of three iles through some of the roughest country in olorado. It is attracting considerable attenon among mining men, as it is the first threehase plant installed in the Rocky mountain reion. The success of direct curreut transmission as been thoroughly demonstrated by transission plants operating in California, Colorado nd elsewhere. The expense, however, insepaable from direct current transmission, preludes the utilization of that system in some laces where the distance exceeds a certain mited number of feet. Where 100 H. P. can e transmitted by direct current one mile at 00 volts, ten per cent being allowed for loss the line, it is claimed by Irving Hale nd other authority that the copper wire ecessary will cost about $2000, aud for the ame horse power transmitted by the same syem for ten miles about $200,000. The threehase current at 500 volts employed to transit the 100 H. P. for ten miles would, it is laimed, make the cost not more than $2000; hat is, the originators and commercial operators of the three-phase system claim that a iven horse power can he transmitted hy the threehase system at 5000 volts, ten times farther than a imilar horse power hy the direct current system at 00 volts for the same expenditure in copper. The uestion of dollars and cents is a prominent factor in all transmission nstallations and the three-phase ystem, where long distance transmission is concerned, is thus asserted to be the most practical system because the most economical. The installation at Silverton is a striking example.

The Silver Lake group of mines lies four miles southeast of Silverton, at an altitude of 12,300 feet. They are owned hy Edward S. Stoiher. The ore mined carries hoth gold and silver, is of a comparatively low grade and requires concentration.

Previous to the installation of electricity the mill, situated on the shore of the lake near the mouth of the mine tunnel, was run hy steam. Coal was brought to the steam engine by the zig-zag path up the mountain shown in Fig. 1, and by the time it reached the furnace cost $8.75 a ton. This represented a monthly expenditure of almost a thousand dollars, and the expense proved a burden which went far to eat up the profits of the mine. Reform, therefore, hecame imperative.

The plant is now operated hy water power, which is brought from the Animas river, above Silverton, through a 3x4-foot flume 9750 feet in length, with an estimated duty of 2350 cubic feet per minute. Flume and trestle are shown in Fig. 2. One great advantage of clectrical utilization is here shown, for it was found less expensive to build this costly two-mile flume, running from above Silverton down to a spot where necessary head could be utilized, and

FIG. 1.—THE ZIG-ZAG TRAIL UP THE MOUNTAIN.

then to transmit the electricity back to the mine, than to continue to burn coal at the price which it brought at the mouth of the Silver Lake mines.

The head of water obtained is about 180 feet; this

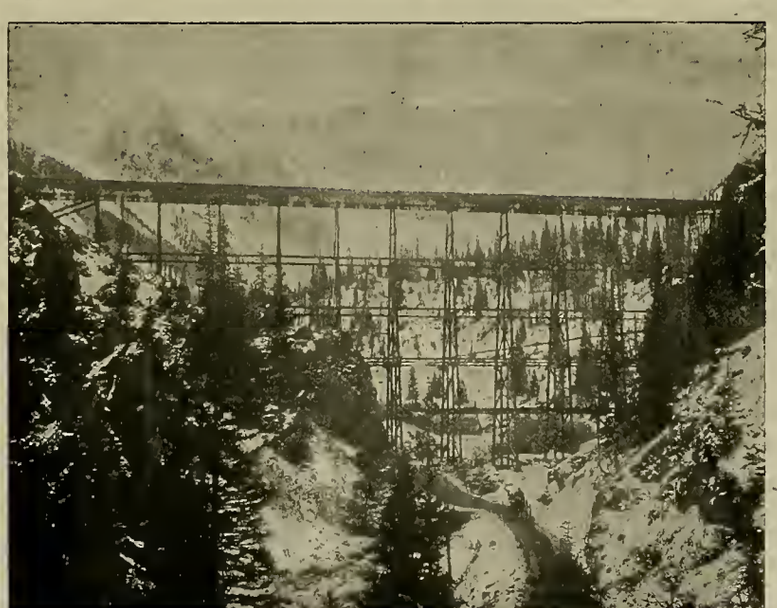

FIG. 2.—THE FLUME.

develops on the water-wheel shaft 640 H. P. The plant consists of two four-foot double nozzle Pelton water wheels, with special huckets, belt connected to two 150-K. W. (200-H. P.) General Electric three-phase generators.

The current from these machines is given out at 2500 volts and is transmitted over a distance of a little more than three miles to the Silver Lake mill and mine. The conductors are No. 3 B. & S. bare copper wires, one for each brauch of the three-phase circuits. These are strung from the power house, shown in Fig. 3, on page 169, up the mouutain passes and through the rugged country shown in the illustrations. In one place where a chasm has to be spanned the wires leap from pole to pole a distance of 275 feet. They have been strung with especial care, as hefitted the ahnormal conditions. At each insulator the wire is run through a short piece of ruhber tube as an extra precaution against leakage. Lightning arresters are placed at each end of the line and an additional safeguard against possible damage by lightning is provided in the shape of a barhed iron wire, which extends the entire distance of the line along the tops of the poles and is grounded at every second pole. In that country, where the storms are frequent and the lightning disastrous in its effects, every precaution is taken to frustrate possible damage from atmospheric discharges. The most effective lightning arresters which have been found for this work are those which the General Electric Company itself manufactures, although every other kind has been tried.

In the winter time the snow lies thickly on the grouud and all the intercourse hetween the mine and civilization is almost cut off. Some idea of the difficulties of the road may be gathered hy referring to Fig. 1, where the zig-zag route up the side of the mountain is shown.

Arriving at the mine the current is supplied to a 100-H. P. three-phase induction motor run directly from the primary circuit. Another 100-H. P. motor, as well as one of 75 H. P., are located heneath the ground and current is supplied to these at a pressure of 220 volts, the reduction in pressure being effected hy step-down transformers. In addition, a 15-H. P. motor runs a pump raising water from the lake to the mill, and oue small 1-H. P. motor operates a blower and the lights for a bunk, office and other buildings, hoth being connected to the secondaries.

The induction motor used is an excellent representation of the latest type of alternating current motor built by the General Electric Co. There are no commutators, collector rings or hrushes; the field winding is connected to the circuit, hut there is no connection hetween the armature and any external source of current. The three-phase curreuts, rising and falling in the field windings, induce corresponding currents in the armature winding and the armature revolves. The field armature cores are so completely laminated that all loss from eddy currents is practically eliminated. The speed of the motor is at all loads practically constant. The starting resistance for preventing any excessive

The Bridging Over of Polk's Strait; A Hard Working Prospector; How Sandpaper is Made; The De Lamar, Nevada, Mines; Safety Appliances for Freight Cars and Locomotives, 169. Coast Industrial Notes; Commercial Paragraphs; Obituary; Personal; Publications Received; Catalogues Received, 171. Notices of Recent Patents, 179.

THE greatest present demand for mining machinery is at the Witwatersrand, South Africa, where a new eighty or one hundred stamp mill is a weekly occurrence. It is calculated that in the next four months 1000 new stamps will be added to the 2745 now in operation in that busy gold region.

THE editorial leader in the South African *Mining Journal* of July 27th is a three-column article regarding this journal and its notices of South African gold mines, in which strenuous objection is made to the quantity and quality of such information, and general adverse criticism is made as to its accuracy. It seems the chief front of our offending is the republication of an item concerning Cecil Rhodes, culled from the columns of our esteemed African contemporary, aud the publicity given herein regarding the stock jobbery—to speak mildly—now going on in South African mining shares in London and Paris. The *Mining Journal* closes its long complaint with the belief that the PRESS must either be "jealous" or else "willfully misrepresents." In its chosen field the PRESS collects and publishes a great deal about the South African gold fields, the same as any other section or region where metal mining of any kind is carried on. Nearly every issue of this paper has the latest procurable data concerning the gold output and what is being done; and the fact that the Johannesburg region is so large a contributor to the world's gold yield, coupled with the further fact that it is California miners who so largely direct and control that work, make the matter of considerable interest to our readers. The information thus published is compiled from correspondence personally received, from statements appearing in our complaining contemporary, from official reports sent by those in authority, and other reputable sources. There is no "jealousy" nor "willful misrepresentation," and it seems puerile for the South African *Mining Journal* to make such silly assumption. "Jealous" of what? What differeuce can it make to this paper or the mining industries of this State or coast whether the Randt gold yield is ten thousand ouuces or ten million ounces per month? And why need there be any suspicion of "willful misrepresentation"? What could be made or gained or what cause, good or bad, served by such course? The only desire on the part of the PRESS is to give the facts in such brief and intelligent shape as to be of value and interest to its readers. This journal has its opinions on matters of mine methods and stock manipulations and is not slow to express them. If they are not in unison with our South African contemporary, while it may be a matter of mutual regret, yet it is here courteously suggested that if the Johannesburg paper will point out any specific error or answer by adduced fact any opinion deemed wrong it will be accorded notice commensurate with justice.

Electricity at Sacramento.

The industrial event of the week has been the electrical display at Sacramento. The occasion was the celebration of the forty-fifth anniversary of California's statehood by State delegations of California "Native Sons," and was most fittingly utilized by the State capital city to exemplify the possession of one of the greatest electrical plants in the world. So much has been published in these columns descriptive of the creative force brought from Folsom that it is here unnecessary to repeat well-known details.

The chief significance of last Monday's celebration is the fact that a great handicap has been removed and that high-priced fuel is no longer so important a factor in the production of power in this State. The success of the great scheme points the way to other similar successes at places equally as well situated. The Sacramento-Folsom transmission is a colossal pioneer in this industrial revolution, and thus, the date of last Monday's celebration marks an era in State industrial conditions.

At Buffalo, New York, the Cataract Electric Co. proposes to successfully compete with coal at $1.50 per ton. At Sacramento the Electric Power Co. has better assurance of successful competition, with coal at $8 per ton.

The following is from the Sacramento *Bee* of the 10th inst.:

Last night the fair city of Sacramento celebrated by a spectacle original in conception, unique in design, and so beautiful and magnificent in its effects as to entrance the 20,000 visitors within the city's gates, and astonish even her own citizens, an event which means much for this city and much for the world. In Sacramento has been first practically solved the grave problem of the long transmission of the electric current for power and light purposes; and from the Folsom dam—twenty-two miles away, where the great turbine wheels of the Folsom Water Power Company, under the propelling force of the falling waters of the American River, generate electricity in four immense one-thousand horse power dynamos—bas been flowing to this city, since the 12th day of July last, the wonderful current that threatens to supplant steam for power, gas for light, and coal for heat.

In defiance of the predictions of many electrical experts the current, since that date, bas steadily traveled to Sacramento with a loss, because of transforming and transmission, between the great dynamos at tbe dam and the motors that furnish power at Sacramento city, of but ten per cent, or a total loss between the turbine wheels and the consumer of power of less than twenty per cent. This current has continuously, since the date named, moved the entire electric car system of this city, and, through the Sacramento Electric Power and Light Company, is now offered to move all the factory wheels of this city and supply its lights.

Not only is this the longest power transmission line in the world, but it is also the largest electric-power plant in the world, in the sense of the power actually developed. The turbines, dynamos, transformers and transmission line are now in place and ready for work, with a capacity of 4000 horse power actually delivered for use in this city. And this capacity can be more than doubled when the necessity arises.

Because of the grave doubts as to the possibility of successfully transmitting for a long distance, and using, without prohibitory loss, such a current, the eyes of the electric world for a year past have been anxiously fixed on Sacramento, awaiting the result of the great experiment. For, though the Livermore brothers—Horatio P. and Charles G.—have made it their life work, and, with Albert Gallatin, practically staked all their large financial resources on the result; though the State of California had, with confidence, prison labor used in completing the great dam for the prison site and a power right; though the General Electric Company had, within the past year, undertaken to successfully deliver the power without material loss in Sacramento City, it was, even by the experts, declared to be a doubtful issue.

Sacramento invited the State and the world tc celebrate with her last night, in fitting manner, the solution of the great problem, and the triumph of the men who have overcome all obstacle in attaining tbe result. At the suggestion of the *Bee*, the form of celebration has been as striking and unique as it was appropriate. It took the form of an Electric Carnival, a magnificent spectacular illumination and display, the first of its kind in the world and which to-day no city can duplicate, though in time doubtless the few places in the world possessing similar natural advantages and with the benefit of Sacramento's pioneering, may do so. Twenty-two miles away the immense water-wheels, fed through pipes eight feet in diameter, with the water of tbe American, ceaselessly turned, producing the electric energy for the great spectacle. Here in Sacramento, from nightfall to midnight, over 60,000 people marveled at tbe wonders wrought for them by the Carnival Executive Committee and tbe Director-General.

Twenty-five thousand incandescent lamps, in the cherry, red, apple green and orange tints of the carnival, made the streets and upper air ablaze with light. They were arranged as Maypole streamers on the 150-foot flag pole at the plaza. They blazed forth salutation and congratulation in immense letters from points of vantage along the lines of march of the carnival procession; they were grouped and wrought on residences and places of business into every form suggested by the fancy of the private illuminator; they showed from behind and above and below the carnival bunting that clothed the buildings; they illuminated and glorified the beautiful floats in the procession, being fed from a continuous trolley wire above the moving pageant; they outlined the cornices, the roof, and every column, balcony and rib of the great dome of the Capitol building up to the bird cage at the top, where a mass of arc lights of 24,000 candle power blazoned to the watching villages and towns for fifty miles away in the valley and one hundred in the foothills that the new Sacramento was leading the procession of progress; tbey glittered in thousands in the huge firs and pines of Capitol park, until the beholder might have believed himself in fairyland attending a review of the Christmas trees of the giants.

Allowing for the natural exuberance of the newspaper reporter, the facts come very close to the above statement.

On the same subject, the *Record-Union* of the 11th says:

The great distributing switchboard for the sub-station has not yet arrived from the East, and without which but very limited distribution can take place outside the needs of the company for its car-lines. It appears that not only have the works, incomplete as they are, met the expectations of the engineers and owners, but have exceeded it, and that the company is surprised at the results in saving and in operation. For instance, the 10 per cent loss in transmission has fallen off to but 8½, and the machinery at Folsom has stood the tests of loading very much in excess of that anticipated.

Sufficient has been shown to exemplify ultimate success; and the fact means much to the capital city and the State.

Mineral Output of '94.

A chart is received from the Department of the Interior, prepared by David T. Day, chief of the division of mineral resources, showing in tabulated form the mineral production of the United States for the ten years from 1885 to 1894 inclusive. The figures are interesting, whether by isolated years or in comparison. The value of the total output in '92 was $648,616,954. The value in '94 was $527,655,562. Nothing could be more eloquent than these two aggregates, showing a decrease in two years of $120,961,392, this, too, in the face of the fact that the gold output of '94 was $6,500,000 more than in '92. the figures for '94 and '92 being $39,500,000 and $33,000,000 respectively. The total value of the metallic products mined in this country in '92 was $307,716,239; iu '94, $218,168,788, a decrease of $89,547,451.

In detail, the figures are particularly illustrative of changing conditions. In 1885, 4,044,523 long tons of pig iron were produced, worth at Philadelphia $64,712,400; in '94, 6,657,388 tons were produced—more thau fifty per cent in excess of the '85 product, but worth only $65,007,247 at Philadelphia. The 39,910,279 troy ounces of silver mined in '85 are reckoned in the government tables at $1.2929 per ounce "coining value," and the 49,501,122 ounces produced in '94 are given a fictitious value of $64,000,000 in the aggregate of $218,168,788 quoted above. At sixty-six cents an ounce, the value of the 49,501,122 ounces yield of '94 would be $32,670,740, instead of $64,000,000, the value assigned in the governmeut report before us. The gold yield of '85 is set down at 1,538,376 troy ounces, worth $31,800,000; in '94, 1,910,816 ounces, worth $39,500,000, the yellow metal being the only one on the list that is the same "yesterday, to-day and forever."

The enormous advance in the production of copper, and, indirectly, the universal extension of electric power which is exemplified in such production, is illustrated by comparison of the 170,962,607 pounds mined in '85, worth in New York City $18,292,999, with the 360,844,218 pounds mined last year, worth $33,141,142. The increase of over 100 per cent in copper production in the ten years is in marked contrast to the small increase in lead, a by-product of many silver mines, and the low price, the figures being, in '85, 129,412 short tons, worth $10,469,431, and, in '94, 159,331 tons, worth but $9,942,254.

Quicksilver exhibits the least fluctuations of any metal in the list, the '85 yield being given at 32,073 flasks, worth $979,189 at San Francisco, and the '94 yield 30,416 flasks, worth $934,000. In sharp contrast is the next metal quoted on the list—aluminum—283 pounds in '85, worth $2550—nine dollars a pound—550,000 pounds in '94, worth $316,250—fifty-seven cents per pound. The strangest quotation in the lot is 250 troy ounces platinum, the production of '85, valued here at $187, and 100 ounces in '94, valued at $600.

Probably nothing more clearly exemplifies the increase in the purchasing power of gold than the cold figures arrayed in the long columns of impartial government figures in this report, where the nonmetallic products are aggregated. In '85 there were mined of coal, bituminous and anthracite, long and short tons, a total of 106,850,096 tons; the spot value (that is the value at the place where produced) was $159,019,596. In '94 there were similarly mined 165,178,549 tons, similarly worth $186,141,564. In '85 were produced 7,083,653 barrels salt, worth $4,825,345. In '94 the salt yield is set down at 12,967,417 barrels, but the aggregate value is only $4,739,285.

The chart is remarkably full, and presumably accurate, and of considerable value for purposes of reference and compilation.

Concentrates.

THE Comstock payroll for August amounted to $68,976.16.

THE shaft of the Gwin mine, Calaveras Co., is now just 1000 feet deep.

WORK was resumed this week in the Utica & Stickels mine at Angels Camp.

THE receipts of gold at the Denver mint during August amounted to $335,144.77.

THE Denver papers suggest the organization of a Colorado State miners' association.

THE *Recorder* says the Idaho Gold Reduction Company of Gibbonsville has collapsed.

THE Shasta *Courier* thinks there is a mountain of magnesite on Pit river near Hat creek.

THE Osborn Hill mine has not closed down. The mill will begin crushing ore next Monday.

H. S. SHERARD has bonded the Yolande mine, Inyo county, and proposes to use the cynuide process.

THE ten-stamp mill of the Trinity Consolidated Mining Company, at Dog Creek, started up again this week.

THE Laramie River Mining and Milling Company, capital stock $150,000, has incorporated at Laramie, Wyoming.

THE Helena, Montana, American National Bank received in one shipment last week 217 ounces of coarse placer gold.

THE payroll of the Hora Silver Mining Company, Utah, for the August services of the employes amounts to $20,000.

DIRECTOR PRESTON of the Mint expresses the opinion that California's gold production for 1895 will exceed $15,000,000.

THE Bess Tweed group of mines, near Pony, Montana, has been sold to Chicago men for a price said to be over $500,000.

THE Coe mine near Grass Valley is reported bonded to a New York company, who agree to commence work by October 4th.

THE New Idrin quicksilver mine, which now has fifty men employed, will put in a new sixty-ton furnace in a few months.

THE *Mail* says Cripple Creek's output is now estimated by the most conservative men at between $800,000 and $1,000,000 a month.

THE Marysville & Yuba River Gravel Mining Co. have ceased operations for the season, save to remove the material from the river bed.

THE Simmilakimeen Falls Mining Company has incorporated at Spokane, Wash.; $500,000 capital; incorporators—C. Reeder, H. Shaw and W. C. Ufford.

THE *Review* says that the contract for building the Trail Landing, B. C., smelter has been let to H. Y. Anderson and Peter Costello, of Spokane, Wash.

THE fire in the mines of the United Verde (Arizona) Co. is reported under complete control. It has not interfered with the output or regular working of the property.

THE superintendent of the Santa Rosa mine, Perris, Cal., will add ten more stamps and a new boiler to run the hoist and pumps. The boiler will be arranged to burn oil.

THE holders of 150,000 shares of the stock of the Mercur Gold Mining Company have refused another offer of $750,000 for it. It is thought a better one will shortly be made.

ZACATECAS (Mexico) miners have bought the mill and machinery of the Old Guard mine at Tombstone, Arizona, and it is now being taken down and hauled to Fairbank for shipment.

THE several county miners' associations are electing delegates to the annual convention of the California State Miners' Association, which meets in this city on the 14th of next month.

SUPT. WHITE, of the Edna mine, San Andreas, Cal., has conferred with the Oakland directors, who authorize the erection of steam hoisting works. The shaft is now in gold-bearing quartz.

A SOUTH DAKOTA mining paper reports a superintendent as saying: "I can get $30,000 for putting a plant at the mine, when at the same time the company refuses me $500 to open up the mine."

THE Bank of England has raised its price for American eagles to 76s 3¾d per ounce, which was not done to attract gold, but because the lower price resulted in a profit on melting the coin into bars.

HUERFANO COUNTY, COL., is attracting some attention on account of the announcement of recent discoveries of tin ore that contains a greater percentage of tin than any yet discovered in this country.

THE Grizzly Flat Gold Mining Company has incorporated; capital stock $1,000,000—$50 subscribed; incorporators—L. Gibson, C. H. Lindley, C. E. Elliott, S. C. Irving and C. G. E. Mainwart, of San Francisco.

THE Alluvial Mining Company has incorporated at San Jose, Cal., with $120,000 capital stock; $70,000 subscribed; to work hydraulic mines recently located by Jas. Farthing near Colon, S. A.; said to be extraordinarily rich.

THE gold yield for Victoria for the quarter ending the 30th of June was 166,709 oz., being an increase of 15,854 oz. over the yield during the first quarter of 1895 and a decrease of 10,729 oz. as compared with similar quarter June quarter of 1894.

NEARLY 200 feet below the surface of the earth in the zinc mines of western Missouri miners have recently come in contact with logs of very fine grain and texture. On top of them were 100 feet of lead and zinc ores and 65 feet of solid flint rock.

A SALEM, Or., man, in receipt of a half-dollar of the government vintage of '94, has written to the U. S. District Attorney at Portland, averring his belief that it is a counterfeit and asking for an immediate investigation. This is hard on Uncle Sam.

A FIRE at the Whitlock mine, Mariposa Co., last Sunday night destroyed the hoisting works and 100 feet of the timbered walls at the entrance of the shaft before it was got under control. The fire started from a lighted candle, near the mouth of the shaft.

THE Golden Sand Placer Mining Company has incorporated; capital stock of $1,000,000, $500 subscribed. The incorporators are J. Reagan, E. Damon, S. T. Hubbell and Charles H. Jackson, of San Francisco; and George B. Tolman of Alameda; to mine in Amador county.

THE Calaveras *Citizen* says the company who have the Scieffard mine under bond have decided to purchase at the end of the three months, that is $25,000 cash is to be paid over by November 1st. The company is composed of Boston capitalists, and evidently mean business. Work on the property will commence about October 1st.

THE Phœnix Mining and Milling Co. has been incorporated at Ellensburg, Wash., by D. Shoudy, J. A. Shoudy, Jr., and E. A. Grundy; capital stock, $150,000. The incorporators have holdings in the Peshastin district and will establish extensive works to develop the property.

A BOND of the Austerlitz Gold Mining Company to the National Mining and Development Co., consideration $80,000; and bond from Albert Sheltenbrand for the Sheltenbrand group of mines, consideration $60,000, has been filed at Tucson, Arizona. All are located in the Oro Blanco district.

SAYS the Jackson (Cal.) *Dispatch:* Wm. Doyle has sold and bonded the Doyle mine, and work upon it has begun in Hunt's Gulch. Twenty-five thousand dollars is to be paid in nine months or $35,000 will be paid for the mine in two years from this sale and contract for said mine and $75 per month to Doyle.

REGARDING recent statements of alleged proffers or negotiations looking to the sale of the property of the Golden Cross Mining and Milling Co., at Hedges, Cal., it is in order to state authoritatively that the property is not on the market, has not been offered for sale, and no bona fide offer has been made.

P. J. SHIELDS, W. D. McCurdie, George A. Cameron, J. Mullen, S. McFarlane and A. A. Collins have incorporated as the United States Mining Company, for the purpose of operating properties in Wicks, Lump gulch and Gregory, Montana, and say they will put $150,000 into development work; capital stock, $500,000.

THE Old Dominion Copper Company, of Globe, Arizona, has entered into a contract with the Gila Valley, Globe & Northern Railroad for the delivery of coke and transportation of copper, and has received assurances that construction of the railroad will be resumed and the road completed into Globe by January 1, 1896.

THE statement of the mineral products of the United States for ten years, just issued by Hon. David T. Day, chief of division of mineral resources, Department of the Interior, shows that the total value of metallic products in 1885 was $181,586,587, that it rose to $307,716,239 in 1892, and declined to $218,168,788 in 1894.

THE South Dakota State School of Mines has gone into the assaying business, and advertises its charges in competition with those who make their living in a branch of the mining business that at the best is poorly paid and subject to enough competition now without having to compete with an institution supported by the State.

THE Franco-American Mining Co., recently organized at Tucson, has bought the Gen. Dietzler group of mines in the Oro Blanco district, Pima Co., Arizona, consisting of the Franco-American, Lonise and Norma mines. Local papers credit the company with an intention to expend between $25,000 and $30,000 in development work before building reduction works.

A WALLACE, IDAHO, dispatch says the Poorman mine at Burke, on Canyon creek, has closed down. One hundred and fifteen men are thus out of employment. The management states that the mine will cease operations for an indefinite period. The low prices of silver and lead and the increased cost of working the property during the winter months are said to be the reasons.

THE Columbia Channel Gold Mining Company has filed articles of incorporation in this city; capital stock $10,000,000. Incorporators—J. M. Harper, J. P. Martin, J. M. Allen, W. E. Sharon and H. McAllister. It is the purpose to work mining property in Plumas county and consolidate under one working management the Columbia, Merced, Sacramento, San Joaquin, Stanislaus, Gallant and Yuba mines in Sierra county.

THE Leon Gold Mining Company has incorporated in Los Angeles; capital stock is $100,000; $75,000 actually subscribed as follows, the subscribers being directors for the first year: C. H. Briggs, $25,000; J. W. Briggs, $25,000; W. H. Bailey, $6249; C. A. Bailey, $6250; W. H. Bailey, Jr., $1; S. R. Porter, $6250; G. W. Parsons, $6250. The company is the owner of the Briggs mine, fourteen miles southeast of Perris, Riverside Co.

IF half what is reported from the Ranchita mine, in Julian district, San Diego Co., be true, there will be a "boom" in that vicinity. Two men are said to have got out $2000 in less than a week. There are a good many good prospects there, and the country shares with other parts of the State the distinction of being the ideal gold mining region in ease of access, beauty of climate, abundance of wood and water and good roads.

THE following statement of the Tacoma Smelting and Refining Co., for the month of August, 1895, is furnished by the secretary of the Tacoma Chamber of Commerce: 2800 bars bullion, weighing 286,741 lbs., containing: 1,660.01 ozs. gold at $20.67, $34,312.41; 28,510.83 ozs. silver at 66¾c, $19,030.98; 282,404 lbs. lead at 3⅓c, $9,598.64; total, $62,942,03. Number of men employed, 60; payroll, $5,039.56; wood choppers and teams, $828; total, $5,867.56.

A COMBINATION of New York, New Jersey and St. Louis capitalists is reported formed to control the appointment of commissioners to succeed W. S. Davis, in the selection of lands on the Uintah and Uncompahgre reservations in Utah. By this appointment the combination hope to get possession of the Gilsonite (asphaltum) deposits there. The material is so valuable that it pays to haul it one hundred miles by team and across the continent by rail.

THE Granite Mountain Company and Fisher brothers, of Montana, have closed a deal by which the Granite Company becomes owner of the Bullion mine, located about 16 miles from Basin, Montana. The price is understood to be $75,000. A 900-foot tunnel has been run on the Bullion along the vein, which is said to be 10 to 12 feet wide and averages $10 a ton. The company has had the purchase of this property under consideration for some time, and several experts have examined and reported upon it.

W. HAMILTON SMITH is now in Cripple Creek, Colorado. The local reporter quotes him as saying of the British investors: "They are timid regarding all American mines. They have been robbed so often by mining sharks that they almost regard American mining men as being devoid of honesty, and are afraid to venture their money on the best showing. They think of nothing but South Africa, and any kind of stock certificate bearing a South African seal can be sold whether the company has any property or not."

FOR some little time past, says the London *Mining World*, rumors have been current to the effect that California was about to imitate South Africa and West Australia by having a mining boom herself. The fact that California is one of the richest gold-producing countries in the world—if not the richest—is such common knowledge that it needs no demonstration. She headed the list again last year in the quantity of the precious metal which 1894 added to the world's store, and it would have been remarkable indeed had such a country escaped the eye of capitalists in search of properties to meet the constantly growing demand that exists for gold mines of proved value.

THE copper lodes in New South Wales were first opened in 1858, since which time many thousand tons of copper ore have been obtained. The London *Mining Journal* says the copper-producing country covers an area equal to about 4,296,320 acres; but there are enormous tracts of country, the exploration of which will increase the area. The most important copper mine in the colony at the present time is the Great Cobar mine, and it also is the most distant from the seaboard, being 497 miles west of Sydney. The value of the copper raised in the colony and exported to the end of 1894 was £6,343,044.

THE owners of the Sunshine group of mines, Camp Floyd district, Utah, last Saturday signed a contract with the Gold and Silver Extraction Co. of America, limited, in the sum of $100,000, the contract to be void should the courts declare the patent invalid. The application of cyanide of potassium to the treatment of its product will be made to the ores of the Sunshine upon the completion of its mill and the turning on of water by the Gold Belt Water Power Company. The daily capacity of this mill is 150 tons a day, to be increased to 300 tons. The productive capacity of the mine, it is claimed, is from 450 to 500 tons a day, with ore in sight to maintain a production at this figure for five years.

THE big strike of the iron ore miners at Ishpeming and Negaunee, Michigan, is still on. The new company scale which the men refuse is as follows: Contract miners' average, $1.70 per day; company account miners, $1.60; underground laborers, $1.40; underground trammers, $1.40; pumpmen, $1.75; foremen of timbermen, $1.90; ordinary timbermen, $1.40; track foremen, $1.60; electric haulage motormen, $2.10; engineers, 12 hours, $1.70; firemen, 12 hours, $1.60; blacksmiths, $1.65 to $2.40; carpenters, $1.70; machinists, $1.90 to $2.25; foremen timber cutters, $1.50; ordinary timber cutters, classed as ordinary laborers, $1.25; teamsters, $1.40; ore inspectors, $1.25; surface laborers, $1.25; surface trammers, $1.30; engineers steam shovels, $2.65; cranesmen steam shovels, $2.20; firemen steam shovels, $1.55; diamond drill runners, $1.75; diamond drill helpers, $1.55.

SOME time ago the Marysville *Democrat* suggested that the California Miners' Association and the Anti-Debris Association should both disband, and gave its reasons for its belief. Since then the attorney for the Anti-Debris Association and other paid retainers of that body have kept up a bitter personal attack upon the *Democrat* and its editor because of his suggestion that that association should cease bestowing sustenance upon them. It was all right for the *Democrat* to suggest that the miners forsake their organization, but most dreadful to make similar suggestion regarding the anti-debris men. Mr. Devlin is apparently dissatisfied with the vigorous and impartial methods of the Debris Commission, which render his official existence unnecessary, and is doing his little worst or best to keep alive factional bitterness. The perpetuity of his job seems, in his opinion, to depend upon his ability to keep alive suicidal sectional strife.

REGARDING the bounty bill recently passed by the Dominion Parliament for smelter ore, it is to be said that there are no smelters in any part of Canada except British Columbia. There are quartz mills, which are inexpensive as compared with smelters. A well equipped smelter will cost above $200,000, and before a smelter can be started in British Columbia the cost of establishing it and the capital required to purchase ores will run from a quarter to half a million dollars. In connection with silver-lead smelting, it is believed that the men most closely connected with the mining industry in Kootenay would prefer to see the duty on lead increased to the same figure as in the United States rather than have the bounty. For this reason, although the United States produces more lead than any other country in the world, it purchases largely from Mexico in this way: The silver-lead bullion is shipped from Mexico to the United States in bond. It is there refined, and the lead, instead of being entered for home consumption, is shipped in bond to Canada and Great Britain. Hence the great proportion of lead used in Canada comes from Mexico, where the miners' wages average eighty cents a day, whereas in British Columbia miners are paid $3 per day, so that the British Columbia miner is brought in competition with the eighty-cent per day labor of Mexico. Therefore they would rather see the duty on lead increased to the same level as in the United States; but the government preferring the bounty system, as is paid to the iron industry and adopted by the Ontario government, have adopted that measure.

A LONDON cablegram says: The financial madness which began to spread among the English public last spring reached what is probably its culminating stage last week. Never during the present generation has there been such an amazing display of insane folly and recklessness in speculation as is now being witnessed. The South Africa and West Australia mining craze has grown until hundreds of millions of dollars have been poured into all manner of enterprises by the general public. Most of the schemes are advanced by Barney Barnato, whose fame is now world-wide. He has been so successful that his name is sufficient to draw millions from the pockets of the gain-thirsting public without other guarantee. The sum which this man has been able to draw into the treasuries of his enterprises, in the form of popular subscriptions, has now amounted to the amazing total of $150,000,000. His last coup is the most astonishing, possibly, in financial history. He put on the market last Monday the stock of the Barnato Banking, Mining and Estate Corporation, Limited. No prospectus was issued nor any statement of constitution, objects or management of the institution. One or two preliminary deals were made with syndicates whose members cleared more than $10,000,000 in a single day by unloading on the public. Demands for shares of this bank, when offered for sale on the Stock Exchange on Monday, seemed limitless. Five-dollar shares sold in immense quantities before business closed at $22. This is equivalent to a capitalization of $75,000,000 of an undefined financial institution, which has hardly begun business. Men of finance, who are not infected by this strange madness, are wondering how soon the crash will come.

Some Calaveras Mines.

By Our Traveling Correspondent.

In a previous article I have described the mines of Angels, and while the mines of that place, by reason of their bullion output, excel at this time those of other sections, yet all the mines of Calaveras county are not at Angels. Southwest of Murphys, Captain Merry has taken hold of the Carley mine and with hoist and mill will soon have it producing. This mine is one of the first quartz mines worked in this section; in the early days it was known as the Sperry mine and afterward as the Webelhuth mine. For many long years Webelhuth worked hard and faithfully trying to make the vein course where he would have it, refusing to drift on the vein when crosscut because its strike was not what he had determined it must be and, finally, in despair, committing suicide, bequeathing the mine to Mr. S. Carley, who had but to drift on the vein to get into bonanza. The main ridge runs about east and west, and from this a spur puts off north until nearing a ridge running east and west, when it turns and swings northwest. The vein followed along the side of the main ridge until it encountered the spur, when it followed the same north to the turn and then swung west with the ridge. As the point of discovery was on this west swing, a determined effort was made to crosscut it on the same strike east. But veins, like gold, are where you find them, and drifts run on the vein now show that it followed the snake-like course of the ridge. The mines in the limestone at Murphys are idle. About a million dollars was wasted there in scratching over the surface of the solid limestone, when a few thousand dollars expended in the development of the contact vein, following the limestone for miles through this section, might have shown up a mineral belt of great value and extent.

On Indian creek the Right Bower, that was very rich in days gone by, waits for some one to take it up. The old shaft can be tapped by a tunnel, the surface water drained and the vein developed. The Calaveras, on the same vein to the east, was still richer. It is claimed by the miners that the last work done was not on the vein and, if it was, the pitch of the shoot is such that the drift run did not extend to it. As old mines with a past bullion record are now in demand, these two are worthy of an inspection. To the north is Sheep Ranch, where the Sheep Ranch mine gave up about $4,000,000 and was then hung up at a depth of 1400 feet. This mine had a shoot 1900 feet long on the surface. In depth the walls came together at one end and gradually narrowed the shoot down to 1200 feet, when it again expanded and was almost back to its old length when work was stopped. With a good hoist and skips instead of the old bucket, and sufficient power, the Sheep Ranch mine could now be made to yield larger dividends than in the past. Near Sheep Ranch H. Cleary & Martin are opening up the Table Mountain gravel mine; their shaft is down forty feet to bedrock, where they claim to have six to nine feet of gravel that gives $3 to the car. They have a good hoist and four-stamp mill in operation.

At El Dorado the mines of the Rodaseni estate are all idle. Among these mines there are some good properties.

Just north of El Dorado the Banner blue gravel mine has just been bonded to Mr. J. A. Rigby and others, who are arranging to put up a good hoist and mill. The bedrock is sixty feet deep there, with fifteen feet of gravel in a channel 120 feet wide and 8000 feet on the stream, the gravel averaging $2.50 a ton at the shaft, with richer gravel above and below them. They seem to have a good proposition.

Railroad Flat is "flat" at this time, with brighter prospects. Mr. W. H. Clary has secured the old Pettycoat mine and will reopen it. The Pettycoat is the mother lode of the camp, the other veins being feeders. In the past the mine milled as high as $100 to the ton from its three-foot vein. Miners claim that the drifts were run in the opposite direction of the shoot, while old Trainor states that the drifts were purposely driven along, but not into, the vein. Be that as it may, the mine is now in the hands of people who will give it a thorough prospecting. Near the Pettycoat is the Keystone—Ellsworth & Co., owners. This is a nice little mine, with a twelve-inch vein in slate that mills an average of $30 a ton from a 200-foot shoot. The old Ham mine, about four miles east of Railroad Flat, is being reopened by tunnel by Ham & Pillsbury. The mine was worked in 1875 and then gave $22 a ton. The Kangaroo, the property of A. Trainor, is the extension north of the Pettycoat. Mr. Trainor is putting down a new shaft and taking out $6 to $8 ore. West, towards Glencoe, the Poorman is being reopened, with C. L. Morrill in charge. The company is showing its faith in the old mine by erecting heavy machinery before beginning work. In the past this mine gave 1900 tons of ore that milled $261 a ton, while selected ore gave $700 to $900 a ton, and the lowest milling value was $81. A plat of the old works, if correct, shows that when the levels were extended to a point perpendicularly below where the ore shoot was struck in the upper level and no ore encountered, the drift was stopped and the mine shut down. Apparently the drift would have caught the shoot had it been extended but a few feet to allow for the pitch of the shoot. The vein is in porphyry. Crossing the river we next strike West Point. This town is one of those camps that "when they're down, they're down," and "when they're up, they're way up." After a long trip on the "down" grade the town is now going "up." At the Lockwood, Calbick & Fuller have put the shaft down sixty feet and are going into an old-time bonanza with a twelve-inch streak of $70 ore on the hanging wall and twelve inches of $171.46 quartz on the footwall. They will now drift out into the ore body and test its wealth. In the past the Lockwood's bonanzas were about eight feet in width, and went from $80 up. The present owners feel very jubilant over their strike, and all West Point is with them. The Blazing Star, W. E. Foster, proprietor, is now down 400 feet, with lower drift run 165 feet on the two-foot vein. The $25 to $50 ore is milled on the mine and all over that is shipped to Selby & Co., and goes from $150 to $185 a ton.

From West Point we drive past Glencoe to Rich Gulch. Mr. W. T. Harris, of the Roanoak, has taken a bond on the old Foot & Thompson mine, and expects to pound out a profit from its low-grade ores, assisted by the occasional pockets. Col. W. T. Robinson is erecting a twenty-stamp mill on the Esperanza, more commonly called the Boston. The mine is developed both by shafts and drifts and shows a very large body of milling ore. The Colonel claims that once he gets the mine fully equipped and developed it will be second to none in the State.

The Gwin, F. F. Thomas superintendent.—The Gwin is perhaps as well known as any of the old mines in the county. Fortunately it has fallen into good hands, and in consequence will in time excel its past production of $3,000,000. Associated with Mr. Thomas are a number of the Kennedy mine owners, the officers being M. W. Belshaw, president; E. C. Voorheis, vice-president; M. W. Belshaw, E. C. Voorheis, D. McClure Jr., F. F. Thomas, E. P. Ellis, directors. The old north shaft was put down 400 feet and the south 1540. For want of a pump of sufficient capacity the work was transferred from the lower to the levels above. The ore bodies in these levels were sufficient to keep the mine running for years, and when the mine shut down the ore in the lower levels was intact. According to the old foreman, J. Oueta, the vein was there about eight feet wide, with quartz milling $8 a ton, and a level run 1040 feet in good ore. This was the north shaft. Mr. Thomas has in operation a hoist calculated to go 4500 feet deep and carry four tons to the load at a rate of 700 feet to the minute. The shaft is 390 feet east of the vein and 225 feet north of the old north shaft. At this time the shaft is down 876 feet, with contract let for 300 additional feet. At 700 feet a crosscut has been run west 300 feet. Mr. Thomas expects to cut the vein at about 365 feet. In driving the crosscut a fissure filled with gangue has been crosscut. This may prove to be the Gwin vein fissure, as the old foreman states that there was no quartz in the fissure in the old drifts until a point lower was reached. Mr. T. is coming to the conclusion that the quartz may not come up that far, and will not crosscut again until the 1000-foot level is reached. This is the Amador county way of operating a mine. Once the other locations on the mother lode in this county are taken hold of by operators who are willing to go 1000 feet to find pay ore Calaveras will have a good number of Uticas.

The Gwin is operated by water power under 365-foot head. Of course there is no mill on the mine, nor will there be until the owners have the ore in sight to feed it.

South of Mokelumne Hill, Mr. W. T. Harris is operating the Roanoak. The mine is opened by a tunnel 400 feet long and a shaft 160 feet on the vein. The vein is about five feet wide and mills $4 to $15 a ton. The tunnel was driven to tap the old gravel channel and the vein crosscut under the channel, upsetting the old theory that "no lava-covered channel was ever known to have a vein running and cropping in the channel." The Roanoak has recently acquired the old Samphear mine to the south, on the same vein, and will proceed to develop and operate it.

At Donnollans De Goyla & Co. are putting the Donnollan mine into shape and have their ditch about completed. The Donnollan is, on the surface, a wide body of ore that shows a large amount of visible gold in places.

Near San Andreas De Goyla & Co. are opening up the Gottschalk and the extension to the west, both on the mother lode.

East of San Andreas the Thorpe mine, in charge of L. Alleghwar, is putting in a large pump The Thorpe has the reputation of being a good mine and of being able to supply its own water—in fact the supply has not only exceeded the demand but the pumping capacity of the plant. With the new pump Mr. A. expects to see an end to this trouble and get his shaft down 300 feet below the present 250 feet of depth, when he expects to be in good ore. With the exception of about three mines, there is a stretch twenty-five miles long, from Angels to Amador, in Calaveras, on the mother lode, that awaits the coming of capital to develop, equip and place its bullion in circulation. Taking the county as a whole, it will be seen that there is at this time double the number of mines in operation that there was a year ago; that the work is in the hands of experienced operators who are able to carry it through to a successful termination, and that, in almost every mine, the showing is good. Mokelumne Hill and San Andreas, in the hands of the present practical miners, will soon put that portion of the county's mining area in the column with Angels' big producers.

E. H. SCHAEFFLE.

Murphys, Cal., Aug. 29, 1895.

Critical Periods in the History of the Earth.*

NUMBER III.

By JOSEPH LE CONTE, of the University of California.

Effect of New Dominant Types.—New dominant types, as already shown, are always an important factor, increasing, continuing and completing the changes commenced by other factors of evolution. This is well illustrated by the rapid disappearance of the great Mesozoic reptiles on the appearance of the Tertiary mammals, and of the great Palæozoic ganoids on the appearance of the Mesozoic reptiles. But in the case of the appearance of man, this effect was far greater than in any other. The changes of life-forms produced during the glacial period in the manner already explained have been continued and increased by man. The whole fauna and flora of the earth are now being changed by his agency and readjusted to his wants, and the change will be completed only when the whole earth is occupied by civilized man. Evidently, then, there is now going on under our eyes and by human agency, a change in organic forms, more complete and more rapid than has ever before taken place in the whole history of the earth. Shall we ignore it because we are in the midst of it, or because we are ourselves the main agent in bringing it about? Must not man be accounted among the agencies of nature?

4. Among the characteristics of critical periods we mentioned also the birth of great mountain ranges. Have we any such born at this time? I think we have.

On account, I suppose, of the increasing rigidity of the earth's crust, the great movements of this time were mainly epeirogenic not orogenic. Mountains of the usual type, *i. e.*, by strata-crushing, were not formed unless we make an exception in case of plications of Pliocene strata in the coast ranges of California, mentioned by Lawson. But on the western margin of the American continent, mountains of the monoclinal type, *i. e.*, by block-tilting, were formed on a grand scale. Examples of these are found in the basin ranges, in the Sierra Nevada and Wahsatch (which border the basin on either side), and in Alaska, as shown by Russell, in Mount St. Elias range. All these mountains had been already formed at a previous time as mountains of the usual type, but at the end of the Tertiary or beginning of the Quaternary, they were rejuvenated and their present forms and heights given as mountains of the monoclinal type.

It is almost impossible to overstate the greatness of the changes which took place during this wonderful period. Besides the elevation of the American continent from 3000 to 5000 feet, and its extension to the border of the now submerged continental margin, and the formation of mountain ranges of monoclinal type; besides the broad connection with Asia by the Behring region, and with South America by the Antillean region; besides the enormous climatic changes and its resulting ice sheet, we must add also great extensions of lakes so as to form inland fresh-water seas in the Canadian lake region and in the basin region. We must add also the greatly increased elevation of the plateau region and the cutting of the inner gorge of the grand canyon, and the cutting of all the grand gorges which trench the flanks of the Sierra Nevada.

Equally great epeirogenic movements are known to have occurred in Europe, Africa and South America, but it would carry us too far to dwell on these.

Psychozoic Era.—I repeat, then, that the present must be regarded as a primary division of time, *i. e.*, an Era. If so, it deserves a distinctive name as such. I have called it the Psychozoic Era. If any one can suggest a better name I shall willingly adopt it.

I have the Quaternary or glacial period as a transition or critical period between two great eras, the Cenozoic and Psychozoic. To which of these it ought to be united is a question of less importance. Critical periods are usually largely lost intervals. This one, partly because the oscillations were perhaps not so great, but mainly because it is so recent, has been recovered. The lost records of other critical periods have also been partly recovered, and more will be recovered hereafter. In these former critical periods the recovered record has usually been united with the previous era. The new era commences only when the new forms are well established. Thus the Permian is united with the Palæozoic and the Laramie with the Cretaceous. Therefore, it is proper

* Bulletin No. 11, of the Department of Geology.

that the Quaternary or glacial period should be united with the Cenozoic. But, unfortunately, it has been usually supposed that this carries with it also the Present as a mere epoch of the Quaternary. Because the record of this interval has been entirely recovered; because the change in this case is seen to be gradual instead of apparently sudden, as is often the case in other critical periods; and finally because it is not yet completed but still going on under our eyes, most geologists do not recognize the greatness of the change. If it were farther away, already completed, and the records of the gradual process lost, it would be recognized at once. As the great mass of a mountain range cannot be seen when we are among its peaks, so being in the midst of this great change, and seeing it so close at hand, we fail to catch the true perspective and recognize its greatness.

If, then, the Psychozoic be acknowledged as an Era, the Quaternary ought to be united with the Cenozoic rather than the Psychozoic. It is true it may be objected, as has been done by Upham, that man appeared in the Quaternary. The answer to this is, that he had not yet established his supremacy, but still contended doubtfully with the great mammals of that time. This is in full accord with the cases of other eras. Reptiles appeared first in the Permian, but the age of reptiles commenced only with the Mesozoic. Mammals were introduced first in the Mesozoic, but the age of mammals commenced only with the Cenozoic. So man was introduced in the Quaternary and possibly even in the Tertiary, but the Age of Man commences only with the Psychozoic. The changes must not only commence but be substantially completed and a new order of adjustment established before a new era begins.

This critical period, as the last, the nearest to us, and therefore the clearest, may be taken as the type. The attentive study of this one ought to throw abundant light on the true nature of critical periods in general. It is, however, the shortest in lapse of time. It is, also, probably the least so far as changes of life-forms produced by physical changes are concerned. But it is by far the greatest of all so far as concerns the effect of its dominant type in determining changes of all kinds.

We have taken this one as the type and dwelt upon it, because its significance is not generally recognized. The other examples are well known and their importance recognized. They may be easily explained in the light of this one and therefore may be quickly dispatched, especially if I have already treated them fully in the article previously referred to.

(To be continued.)

Why Are Good Mines For Sale?

The answer may be found in a simple statement of fact. In a great many instances the owners are men whose lives have been spent in poverty and a daily struggle for existence. They know they have a fortune; they have had enough of battle and strife. They want to enjoy life. They have dreamed of a "good time," and they want to realize their dreams. The man, no matter whether young or old, who never before had a dollar, who suddenly finds himself the owner of property worth many thousands, has an uncontrollable desire to see his fortune in shining gold or crisp bank notes. He wants to take life easy. He wants to move out of a miner's cabin into a home provided with the luxuries of life, and he don't want to wait. He has not been wealthy long enough to want more. He feels that he never will want more, but what he has in the way of property he wants to convert at once into cash. It may be added that there are now many prospectors climbing the mountain sides, searching for the precious metals, who have owned great mines, sold them and wasted the money having a good time.—Sierra County, N. M., Advocate.

A GIGANTIC UNDERTAKING, the bridging over of Polk's strait, separating the island of Ceylon from the mainland of India, is seriously proposed by the government of Ceylon. The strait is forty-one miles broad at its narrowest point—double the width of the English channel—but is very shallow, in many places only six feet deep. The islands, reefs and channels in it have been recently surveyed, and the cost of the work, extending over sixty-one miles, including the Pambam channel and the Adam's Bridge reef, is estimated at 28,000,000 rupees. The ends will be connected by 145 miles of railroad with Colombo, the great harbor of Ceylon, on one side, and by ninety miles of road with Madura, the nearest point of the Indian Railroad system, on the other. If narrow gauge is used this can be done for 11,000,000 rupees more.

Three-Phase Long Distance Electrical Transmission for Mining Work.

(Continued from page 165.)

current in the armature winding while gaining speed is contained in the armature itself, and the handle shown in the cut serves to cut out the resistance when the motor is fully up to speed. These induction motors are built to stand the severest conditions met with in actual service and wherever they have been employed have answered every requirement

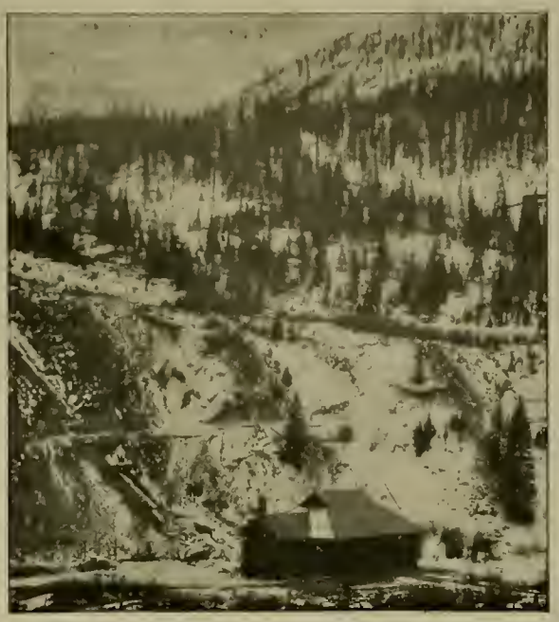

FIG 3.—POWER HOUSE AT END OF FLUME.

possible. The interest in this mine centers, of course, upon the economy induced by the electrical installation. The power used in the mill and the mines at the present time is more than three times as much as was used when generated by the steam engine previously employed. If, therefore, $1000 a month, or $12,000 a year, would be economized by using the same power, an economy of not less than $36,000 a year is effected by the operation of the mine by electricity and a greater power is available. This has allowed of the operation of machinery inside the mine for the first time.

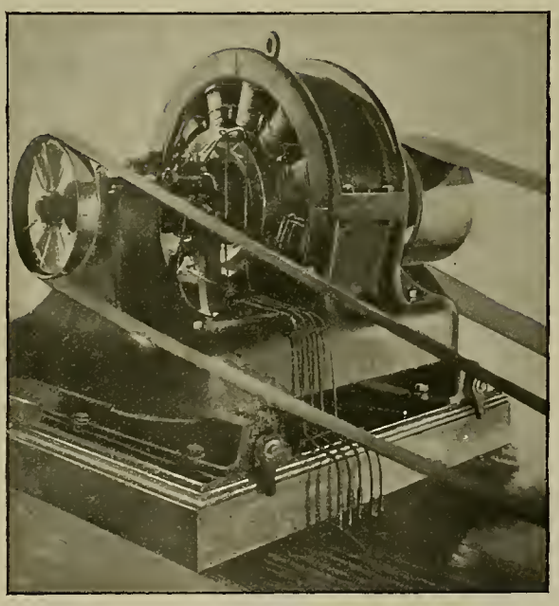

FIG. 4.—THE THREE-PHASE GENERATOR.

Before such figures as these any question as to the economy of an electrical installation, when coal is anywhere near the price it is in this case, becomes irrational.

A Hard Working Prospector.

George Hawlin, of the Relief mine, is in town. He says things are looking away up on his property. On being asked how much work he had done, he said: "Work is a little slow, which of necessity it must be when I have only an 'arm strong' hoist to pull dirt out of a hole 180 feet deep. The fact of the matter is I have done a whole lot of work, which I will tell you all about if you will just wait. You see on the Venus, which is westerly of the Relief, at a point about 1200 feet from the center, there is a shaft twenty feet deep with $20 ore. Three hundred feet from there is a 112-foot shaft of $12 ore. Five hundred feet farther, 20-foot shaft with a streak of $30 rock. Thirty feet from that is the Relief, where there is a 17-foot shaft with $17 ore. Twenty feet north of that is a hole 10 feet deep that has $60 ore in it. One hundred feet east of that is a 40-foot shaft with $7 ore. One hundred feet from that is a 25-foot shaft, $10 ore. Easterly 100 feet, 20-foot shaft, $10 ore. Sixty feet easterly is the 180-foot shaft, which has a 20-inch vein of $16 rock. Farther easterly, on the Relief No. 2, I have three feet of $10 ore on the surface. Now, that is all there is to it, and if you don't believe it just come out and we will prove it. But for God's sake don't say that I have got a bonanza."—Phœnix Herald.

How Sandpaper is Made.

Sandpaper as now made is false to its name, for it has no sand about it, the place of that material being now taken usually by powdered glass, which does its work with greater effect.

First is the pulverization of the glass into different grades of fineness. Commonly, an iron mortar is used; stamping machinery is better. Such a machine consists of a stout box whose iron walls serve as a base for the stamping machinery. In the box are two iron cylinders in which the stamps work. These crush the glass, turning on their own axis as they work.

For grading the crushed glass, several sifting cylinders are necessary, covered with gauze of different mesh. Beginning with the coarsest, the work proceeds gradually to the finest, resifting each time that which passes through the network. The paper to be used in the manufacture must be good, strong and long-fibered, free from knots and irregularities. It is cut into large sheets, spread on work tables, fastened down and painted with a thin, even coat of hot glue. If the glue is too thin and the paper of bad quality, the glue soaks into the paper, so that which remains is not of sufficient consistency to hold the glass. Thus results a sandpaper from which the glass easily rubs off, or which in places has no glass at all or not enough. This is notably the case with the coarser varieties, in which the layer of glue must be put on with exceeding care, that the relatively large fragments of glass, which can in no manner be soaked with the binding material, may be held fast in it. On the other hand, if the layer of glue is too thick, the outer part hardens too quickly, so that the glass powder cannot imbed itself in it.

When the glue has been spread on the paper, the powdered glass must be sifted on through an appropriate sieve. This operation also requires considerable skill, though not so much as the spreading of the glue, for the glass must not be sifted merely in such a manner as to use a given quantity to a sheet, but so that each sheet may be covered evenly. Even then all the powder will not stick, and some of the particles lie upon others without touching the glue. These can be shaken off by a slight movement of the paper. When the superfluous glass powder has been removed a wooden roller is passed lightly over the paper to press the particles of glass as firmly as possible into the glue and to form a perfectly even surface.

The De Lamar, Nevada, Mines.

TO THE EDITOR:—The principal group of mines in this camp is owned by the De Lamar Gold Mining Company, and consists of six locations. The ledge is forty feet wide, the highest grade ore milled running from $50 to $100 per ton in gold; the lowest grade ore in the forty feet will run $12 per ton. This group is worked by tunnels, and employs sixty-five miners and fifty mill and outside hands. The ore is treated by the cyanide process, the capacity of the mill being sixty tons per day. Attached to the mill is an electric plant, saw mill and air compressor which furnishes air for the rock drills. About $30,000 worth of bullion is shipped each week, being carried 150 miles by the company's Concord coach to Millford, Utah, which is the terminus of the railroad. Three thoroughly armed messengers accompany the coach, in case of an attack by road agents.

The April Fool group consists of five claims and is owned by Wilson, Dooley and others. Four carloads of ore have been shipped from this group of mines, the first two carloads netting $300 per ton and the other two $600 per ton. Two more carloads are now being hauled to Milford.

The town of De Lamar is building up very rapidly, there being ahead four large stone buildings, together with 200 other houses and tents. Very little development work has been done on outside properties, although there are several large ledges, the cropping of which will run from $4 to $8. Cord wood is worth $5 per cord, and water one cent per gallon.

MINER.

De Lamar, Lincoln Co., Nevada, Sept. 2, 1895.

ON the basis that there are 1,250,000 freight cars of all kinds and 35,000 locomotives in service in the United States, it will cost $52,000,000 to fit them with safety appliances as provided by act of Congress. All work must be completed by Jan. 1, 1898.

Mining Summary.

CALIFORNIA.

Amador.

AMADOR QUEEN.—*Dispatch:* James Dye is opening up and cleaning out the old shaft and tunnel in the Amador Queen mine below the Doyle mine, and just below and joining the south end of the 60 stamp mill of the Amador Gold Mine Limited, now called the Amador Gold-Fields and has erected a large derrick and hoisting works down in the Gulch, below the mouth of the Amador Queen.

THE ANITA.—*Republican:* Bids for running 300 feet of drifts at the Anita were opened last Saturday. The lowest bid, was for $3.15 per foot. A prior contract was at the rate of $10 per foot, and at that rate the contractors were not able to average more than $3 per day.

Calaveras.

Echo: H. Routledge has received information that the Blazing Star and Lone Star mines at West Point, on which he holds bonds, are sold to a company in London, England, through the agency of Wm. Hibbitt.

El Dorado.

UNUSUAL AT PLACERVILLE. — *Republican:* Some rather curious mining operations were going on at the Unity mine this week, a hydraulic being set in operation almost under the steam engine used for hoisting. During the last two months Superintendent Kimble accumulated about 3,500 carloads of gravel in a dump over 100 feet long, and concluded to wash this through a flume. Pipe was laid and the water turned against the pile of dirt last Thursday with about fifty feet pressure. This is the first time hydraulic power has been used in this county to wash the dirt from the drift gravel mines.

THE UNITY MINE.—*Democrat:* At the Unity mine, formerly the Wild Cat mine, near Gaylors bridge, one of the group of mines owned by the Pine Hill Mining & Land Company, eight men are now employed, under Supt. Hill, excavating and grading a site for the new hoisting plant.

THE LONE STAR.—The Lone Star or Newton mine, with Hutchinson for Superintendent and Theodore Rupley for foreman, is running with a force of twenty-one men. Rich beds of grave 12½ feet deep in the main tunnel, four feet deep on the upper bench and of unknown extent, have been developed.

Los Angeles.

NEW COMPANY.—The Piramide Mining Company has incorporated; capital stock, $2,000,000. Directors—P. L. Griffin, G. R. Weeks, Los Angeles; W. E. Howard, San Diego; L. Hahn, Hastings, Nebraska; B. Morse, Riverside; G. Bratt, Hemet, Cal.; W. S. Oliver, Ensenada, Baja California.

Nevada.

THE TREVASKIS MINE SOLD. — *Transcript:* Geo. B. Treadwell, who placed the well-known Trevaskis mine on Red Hill, near this city, on the London market a few months ago, received word this morning from his partner that all the stock had been taken by English capitalists, and the coin therefor had been paid into the bank. Parties from London will reach this city soon, and in the meantime work will be commenced upon the property under the direction of Mr. Treadwell. There is to be no half-way business about the working of this property and ere long a large number of men will be employed. The mine has heretofore yielded a large amount of the precious metal and the future will demonstrate that this property, which has been worked on a very small scale in the past, will be a handsome dividend payer.

THE BIG TUNNEL.—The *Tidings* bears that the Gold Bank Tunnel Company will come into possession of the Jones' Bar property, in the South Yuba river. It is considered that this will be a favorable site for the mouth of the tunnel, as it furnishes good dumping ground, and gives room for mills. It is also said to be a mile nearer the rich mineral belt, which it is the object of this tunnel to tap. As the tunnel must cut its way through hard syenite and granite, this is an important consideration. The mouth of a tunnel at Jones' Bar would also be 200 feet lower than the point where the tunnel was formerly designed to start, viz, Hoyt's Crossing. This is equivalent to almost 500 feet on the incline in Grass Valley mines.

If anything is to be done with the Gold Bank Tunnel or its resultant project, this would seem a favorable time. Never has there been such activity as now in quartz mining in the district effected. The project seems as feasible as the Sutro Tunnel. As was intimated in a former article in the *Tidings*, there are now two distinct tunnel propositions on foot. It would please the mining people of Nevada County to see one or the other pushed to a successful issue. A tunnel from the South Yuba River which would drain the Nevada City and Grass Valley mines at a depth of 1200 to 1400 feet, and which might also open up numberless veins of gold-bearing quartz, would be a grand thing.

Mono.

MINERS' MEETING.—At a recent meeting of Bodie miners and mine owners, A. Lazard was elected mining recorder to fill the vacancy caused by the death of L. Lewis.

MAMMOTH MILL.—The new twenty-stamp mill will be running by Dec. 1st. About thirty men have been employed till recently, when a draft was made.

San Bernardino.

The Holcomb Valley Mill and Mining Company will, it is reported, soon start up a new mill at their Holcomb Valley mines, north of Redlands. The new mill will have a capacity of fifteen tons a day, and there are now about 400 tons of ore on the dump which runs from $15 to $20 a ton.

San Diego.

REPOTED BONDED.—The American Girl group of five claims, near Ogilby, is reported bonded by Lowman & Johnson for $120,000, to an English syndicate.

REPORTED BONDED.—Messrs. Johnson, Olson and Mead are reported to have bonded the Homestake, Black Hills, Stonewall, Comstock, Good Hope and Aurora gold mines, in the Ogilby district, to George C. Tildeu of Colorado for $45,000.

LOCATION AND TRANSFER.—C. B. Richards, C. L. Josselyn, C. Jaynes and S. Clark, says the San Diego *Sun*, have in the office of the county recorder a notice claiming the location of the Double Standard mine, situated in the White Gold Basin of the Picacho district. In the same connection, a transfer is made by which Miguel C. Marlinze sells the Silver King mine to Josselyn and Edwards.

Shasta.

IRON MOUNTAIN.—*Free Press:* The number of men employed by the Iron Mountain Railroad Company is being increased daily. There are now six or seven camps of graders established along the line of the road.

AFTERTHOUGHT.—There are some indications of work on the Afterthought mine being resumed. The mine has been idle twelve years and the mill is now wholly dismantled. A number of mining men have inspected the property lately.

THE EMPIRE.—The Empire Mining Company at French Gulch has already expended $20,000 in prospecting the mine and repairing the machinery. Their old mill is a small 4-stamp affair, but the company has recently purchased a new 5-stamp mill, which is expected to arrive shortly. The four stamps ground out $1,900 in gold last month, and a six-pound brick was shipped to San Francisco Wednesday.

Siskiyou.

HUNGRY CREEK.—Patterson Bros. of the Hungry Creek district are reported to have struck rich dirt up their high channel, finding heavy wash gold. They took out $200 in three days last week. In the same district McBride & Little are taking out some money, working the China claim. Montgomery & Son are drifting on their placer ground and doing well. The Sterling mill and mine will, it is thought, be operated by Colorado mining men.

Tuolumne.

AT CAMP WILKINSON. — *Democrat:* S. S. Badger has increased his force of men to thirty-five, and put in larger pumps, and expects to shovel out gold from the river bottom until January.

SAN GUISEPPE.—W. G. Whorf has taken hold of the San Guiseppe mine again. The water is being pumped out of the mine, and everything is being arranged for the vigorous working of the property.

NEVADA.

GOLD HILL MINES.—A 10 cent assessment was levied on Seg. Belcher on the 12th. The weekly letter says: On the 300-foot level the joint Belcher and Seg. Belcher east crosscut from the south lateral drift is out 14 feet; the face shows porphyry.

Have hoisted during the week and stored in the ore house at the mine 11 tons of ore, the average top car samples of which show an assay value of $22.16 per ton.

ESMERALDA COUNTY.

SILVER PEAK.—Three 18-horse teams are hauling ore, twenty-five tons each load, from the mine, a distance of nine miles.

The mill battery consists of thirty stamps, with a self-feeder for each five stamps; eighty tons of ore is crushed every twenty-four hours. The cyanide process is used in extracting the gold. There are seven iron tanks, capacity eighty tons. Each tank is allowed to stand seven days after being charged and there being seven tanks, one is charged and discharged every day in the week. About eighty tons of tailings, which average $7.50 per ton, is being reduced by the same process each day. The tailings from the old mill are estimated at 250,000 tons. There are about thirty-five men employed in the mine and about twenty around the mill. It is claimed that there is 13,000,000 tons of ore in sight in the mine; the ledge is from 50 to 100 feet wide.

LINCOLN COUNTY.

SOLD TO THE MARIE.—It is stated that the interests of Messrs. Monagban and Murphy and others interested with them in the El Dorado Canyon vicinity have been sold to the Marie Mining Company. The sale includes six millsites and twenty mines, and the Marie intends putting up an electric plant and all the latest appliances for handling ore.

OREGON.

IN GRANITE DISTRICT.—In the Granite mining district, Mr. Grant, representing a Salt Lake syndicate, is reported "buying everything in sight"—placers and quartz claims alike. He has already picked up a big lot of mining property and is preparing to operate. He is putting in a $7000 steam shovel, which will be used in working over some placer ground near Granite.

FROM THE ASHLAND MINE.—*Tidings:* Thos. James, foreman and superintendent of work at the Ashland mine, went to Vallejo Junction, Cal., Friday, with two carloads of ore from the mine for reduction at the Selby Smelting Works. There were 26 tons in the shipment.

WASHINGTON.

MOVED TO PESHASTIN. — The stamp mill belonging to the California Mining Company, which has been stored in Wenatchee for several weeks, has been moved to Peshastin. It is understood that the mill will be set up and put in operation and that the company has found something pretty good.

THE OKANOGAN COUNTRY.—The Grey Eagle Mining Company is the only company now operating to any extent, the ore, which is said to average $20 per ton, is milled near by in a mill leased by the company. The vein is about six feet wide, free in both walls. The walls are porphyry and granite. The vein is continuous and regular with a dip of about fifteen degrees from the perpendicular and having a strike nearly east and west. The cost of mining and milling is estimated at $6 per ton.

BRITISH COLUMBIA.

PROBABLE CONSOLIDATION.—The Trail Mining company, who own the Columbia, which adjoins the Kootenay on the west, are willing to compromise their differences with the Kootenay people and consolidate both claims into one company. Martin King, one of the owners of the Columbia, has gone to Chicago to confer with his company on the proposition.

TWO SMELTERS TO BE BUILT.—A. E. Humphreys, speaking of his Trail creek properties, says: "It is the intention of the Crown Point, Iron Horse and Kootenai mining companies to put in the next year in developing the various properties and put them in shape to commence shipping ore. When this has been done we will build a smelter at Trail Landing to treat the ores. Until the plant is ready for operations, however, I expect we will send the ores from the Crown Point and Iron Horse to the smelter which is now being built by Mr. Heinze at the Landing."

KASLO AND THE SLOCAN.—The concentrator at Three Forks is reported turning out a carload of concentrates a day. The Pilot Bay smelter has turned out 1000 tons of hullion since the 1st of June.

The narrow-gauge road from Kaslo to Sandon, twenty-five miles in length, has ten miles of track laid, nearly all the grading done and will be finished before the 1st of November. Its completion will put the Slocan Star and other mines in direct connection with the steamers on Lake Kootenai.

The Canadian Pacific is building a branch from Three Forks to Sandon. This will give Three Forks mines two outlets, one by way of Nakusp and the Columbia river, the other by way of Kootenai lake.

ALASKA.

THE TELLURIUM AND MT. KING.—Lytton Taylor, of Juneau, representing Eastern parties, is reported to have bought the Tellurium group of fifteen claims on Admiralty Island for $50,000, and the adjoining Mountain King group of eleven locations for $20,000. A 10-stamp mill, hoisting works, etc., is to be put in.

IDAHO.

MINES NEAR MURRAY.—The Daddy Gold Mining Company, G. W. Coplen, manager, have a ten-stamp mill and employ thirty men. They are driving three drifts. The lower one is in 370 feet, while the upper are 260 and 100 feet respectively, opening about 300 feet of stoping ground. They have a ten-inch vein of friable ore, which they claim runs about $12 per ton. In taking out the ore it is necessary to break down about 24 inches of waste. In order to save handling, this waste is run through the mill, which makes the ore seem lower grade than it really is. This mine has for milling purposes 1500 tons of ore on hand and enough ore in sight to run the mill at its present capacity (25 tons daily) for twenty years. In this mine the ore runs quite evenly, but occasionally strike a pocket.

The next claim above, on the canyon, is the Mother Lode. This is a ten-stamp water power mill. Owing to the scarcity of water, they are only running five stamps.

The Golden Chest Mining Company Jno. Coumerilh, lessee, on the opposite side of the gulch, has been successfully operated for the past four years with N. M. Gregg as superintendent. This mine was discovered in August, 1883, by A. D. Coplen, present assayer of the Daddy mine. They have a ten-stamp mill and are building another of same capacity at the lower tunnel and will operate both mills as soon as the machinery can be put in place. This property has a vein of ore averaging five feet in width and plenty in sight to run both mills two years. They will soon have fifty men on the pay roll.

THREE FEET OF ORE.—The Red Cloud has three feet of ore in the face of the advanced workings.

The mill is to be removed from the upper workings to the tunnel level when the company will resume regular shipments, with the expectation of a monthly average of 300 tons.

MOSCOW MICA MINES.—The Rodgers Mica Mining Company of Cleveland, Ohio, with property near Moscow have begun operations at the mines, having sold all the stock desired. The product will be shipped direct to Cleveland. Capt. E. E. Rodgers is superintendent. The Silver White Mica Mining Company, of which Capt. Rodgers is president and manager, will resume operations in a few days running a tunnel to the vein. The company is well equipped with funds and expect to continue work all winter.

A BIG MINING DEAL.—The Boise *Mail* is authority for the statement that F. F. Corning of New York, and H. H. Daniels of Denver, representing a French syndicate, have bonded the Black Jack, Trade Dollar and other mines, in Silver City, and that a company will be organized in New York to build a railroad from Butte, Montana, that would run south through Idaho to Silver City.

THE YELLOW JACKET.—Lemi *Republic:* N. A. Bihikov has made a thorough examination of the Yellow Jacket Co.'s mines, and says the mines are an immense body of fine ore, which would average about $15 per ton. According to his examination and measurements there must be in the neighborhood of 500,000 tons of ore above the lower tunnel. The company will soon have sixty stamps dropping, which will increase the mill's capacity to 200 tons per day.

THE BLACK HORNET.—The Black Hornet mine, near Boise, has been bonded to H. W. Barry of Denver for $100,000 for ninety days.

MONTANA.

THE CLIPPER GROUP.—The Clipper group of mines near Pony, owned by Elling & Morris, and the mining interests adjoining this group, owned by H. C. McKaskle are sold to an English company for $350,000, of which considerable has already been paid.

The English capitalists who are now negotiating for the mines are prepared to expend considerable in getting things in shape. It is understood they will proceed to erect a 100-stamp mill about three-quarters of a mile from the Clipper group, and will also construct a tramway similar to the one at the Bimetallic mines in Granite county.

THE ELIZABETH PROPERTY. — The stockholders in the Elizabetb Mining Company have received a circular from L. M. Rumsey, president of the company, in which a plan is suggested to redeem the property by the payment of three cents per share.

The Elizabeth property was recently sold at sheriff's sale for $31,900 to satisfy a judgment of $8,533.67 held against the property by the Union Trust Company of St. Louis, and there is now $23,175.23 in the treasury, which amounts to about four cents per share, and this amount will be turned over to the stockholders in the event that the redemption is not made by the plan of the late circular.

The plan of redemption is to organize a new company under the laws of Montana, which would make the stock assessable, with a capital stock of $5,000,000, to be known as the Alameda Mining Company. It is proposed that each holder of stock in the Elizabeth company forward his stock to L. M. Rumsey with proxy entitling him to vote it for a reorganization and to sell the assets of the Elizabeth for a sum sufficient to redeem the property sold at sheriff's sale, and to pay all other debts against it; the stock also to be accompanied by three cents for each share turned in, which sum will go to pay the judgment of the Union Trust Company.

EXPERIMENT WITH CYANIDE.—Experiments with the cyanide process are about to be made at the Voltaire group of mines, located some four miles from Fort Maginnis, in Fergus county. If it can be shown conclusively that the ores from these mines can be worked by the process, it is proposed to erect a big cyanide mill and to start in on extensive operations. Mining experts who have examined the ores from the Voltaire group say that the rock can be successfully treated by the cyanide process. Burr Clark, a noted cyanide specialist, will have charge of the experiments.

UTAH.

THE GOLDEN GATE.—*Tribune:* The Golden Gate, which has now acquired a depth of over 300 feet, has proven up a strong vein between well-defined walls. Ores are found that assay from $150 to $900 a ton, while an average value of $33.15 is claimed for the milling class.

The arsenical feature of the ore is the only objectionable matter contained in it, but the roaster will readily overcome this and pave the way to the mill, where its values will yield readily to the cyanide of potassium.

The management has not yet decided on what process it will adopt for the extraction of the metal, but will in a very short time, when the erection of a plant will begin.

THE DALY-WEST CONCENTRATOR.—Salt Lake *Tribune*, 10th: Action was taken late yesterday afternoon by the management of the Daly-West as to the awarding of the contracts for the machinery for the new concentrator for that body. The bids were opened on last Friday, but were so variable in their general terms that each bid had to be analyzed. The contract was finally awarded to the Risdon Iron Works of San Francisco, and that concern will be placing the machinery on the ground within the next sixty days. The plant will have a capacity of 125 tons per day. The power of the plant is now double the above figures, and the plant will likely be enlarged before it is a year old. The foundation for the mill is now in and work on the superstructure is under way.

NEW MINING COMPANIES.—The Vanderbilt Mining Co. has incorporated at Salt Lake; capital stock $150,000. Incorporators: I. Brockbank, E. Morris, J. R. Isaac, J. W. Fox, Jr., I. Jennings, E. Rushton, C. W. Hardy and T. Winter. Arnold G. Giauque, secretary. The company owns the Vanderbilt, Concordia, Center and Star mining claims in the Mineral Hill mining district in Blaine county, Idaho.

The Occidental Mining Company, capital stock $250,000, has incorporated. Incorporators: M. A. Jones, J. Dern, E. H. Airis, F. Pierce and H. Buhring. The company owns the Occidental, Adrian T. and Elizabeth claims in the Camp Floyd mining district in Tooele county.

NEW MEXICO.

COPPER PROSPECTS.—N. S. Berray, who has done much toward the development of the copper mines at Globe, Arizona, has taken charge of the copper mines at Copper Flat, near Fort Bayard, and has started development work upon the property by four shafts and inclines. Fifteen men are employed upon the mines and the force will shortly be increased.

ARIZONA.

AN ADVANCE ALLOWED.—The Tucson Smelting Company has allowed an advance to its patrons from $1.45 a unit to $1.79 a unit on say twenty per cent ore. The present quotation of $12.30 is equivalent to $1.90 a unit, so that the advance is nearly $9 a ton, or about 33⅓ per cent, a sufficient inducement to create activity in the copper mines of that region.

THE COARSE GOLD MINE.— Prescott *Courier:* The Coarse Gold Mine, formerly known as the Mexican mine, near Wickenburg, is again

rning out many handsome gold nuggets om its 30 foot quartz ledge.

AT GOLDFIELD.—The new mill on the Bull g mine at Goldfield, Ariz., has been coated nnd started up. There is enough ore sight to keep the uew mill running night d day for a year, but prospecting for more e will go on.

COMING TO THE FRONT.—Harshaw, the old ver-mining camp twelve miles southwest of ittenden, is reported again prosperous, a mber of rich claims being worked. A new dy of ore is said to have been discovered in e old famous Treuch mine, and at the pres- t time over one hundred mea are being nployed on it. The Trench Is one of the lest kuown mines in Arizona and is said to ve been worked by the Aztecs hundreds of ars ago. In those days they used the coiled winding stairway, walked down into the pths of the earth and carried out the pay rt In buckets on their heads.

OUTPUT AT THE MINERAL HILL.—With the vent of the Tucson smelter the Mineral ill property, eighteen miles distaut, is producing copper. The force is eighteen men. ext month it will be increased to nearly 100.

COLORADO.

THE TOM BOY.—The Tom Boy Gold Mines ompaay produced betweeu $85,000 nnd $90,- 0 in the month of July, says the Telluride *epublican*. Of this $75,000 was caught on the ates by amalgamation and shipped out in old bricks nnd the rest carried by the concentrates. Enough of this kind of ore is blocked t and in sight in the mines to supply the ill at the present rate of cousumption (150 ns per day) ten years.

LEASING MADE IT.—The leasing system has oven the salvatiou of Cripple Creek, says o Denver *Republican*. Companies who owned ound nnd individuals who had more claims han they could possibly attend to leased hem to miners who proceeded to develop the roperties with all speed. In a good many iuances the leases were for short terms, and he aim was to get out as much ore in as short me as possible. The lessees were largely esponsible for bringing about the revival hich hecame noticeable about March or pril last. They were able to give employent to a force of men as the returns for the e came in.

When the originnl hoom started over three ears ago the rule was to get possession of a iece of ground as large as possible, sink a few et and start a company. If the stock sold he development was continued, and if it was nsalable there wns little more done. The ompanies that had really valuable ground ften employed inexperienced men to take harge of it, and the result was that for some me the camp was retarded, Then some of he concerns decided to try the leasing plan, nd it was so successful that others followed. he individuals and the companies that leased heir prospects were benefited, and the camp egan to pick up. The lessees were in almost every case practical miners acquainted hore or less with the mineral, and they were he very people to make the most of it. With he unsettled condition of affairs that followed the strike a number of owners decided o lease their ground also, so that until rently the lessee on nearly every portion of he district was the rule.

Of late a good many of the leases that have un out are not being renewed, as the owners re beginning to come to the conclusion that hey can have the mining done under their wn direction. A lessee doos not do any more evelopment work than is absolutely necesary to get at the ore, and while he gives a nine a good start it is found to he better not o continue a property too long under that ystem, and the conditions that existed when he leases were granted have been more or ess removed. But the system will continue, o a greater or less extent, in the camp for ome time. There are numerous instances where a mine could uot he worked by the wners, but where the lessees were enahled o pay goodly sums in royalties and make big wages for themselves.

The lesseos are prosperous and have money o spend. When the system started they had o club together to get sufficient to live on, nad they had to keep the men who were working for wages poor, too, as the latter often supplied the gruh stakes. The business men complained at that time that the leasiug system was affectimg all kinds of business, and probahly they were right, but there is no complaint of that kind now. The lessee is an important member of the eamp.

MINING SALES.—Cripple Creek *Mail:* Senator Tahor has an $85,000 option on the Free Coinage group, having paid $1,000 cash.

A $70,000 option has heen given on the Morning Star and Burns, property of the Calumet company.

The O. K. has been bonded to the Golden Ridge company on a two years lease. The shaft will he put down another fifty feet.

Application was made hy cahle from Paris a few days ago for an extension of thirty days on the option given on a controlling interest of the Isahella stock at 40 cents. President Hagerman refused.

The Calhoun Gold Mining Company has purchased the Ithaca tunnel site which cuts Battle mountain and ends on the Trail property on Bull hill. Manager R. G. Tucker has plenty of money at his command and will push the hore to its completion.

LOWER CALIFORNIA.

RICH MINE SOLD.—Senor Corrales, who with Manuel Riveroll has been developing rich gold claims at Zaragoza, forty miles east of Ensenada, has sold his half interest in the property to B. L. Harding for $15,000 cash. Mr. Harding, of Ensenada, will purchase machinery which will he put up at the mines and developing continued. Other claims in the district are owned hy Americans and Mexicans, who consider the Zaragoza country one of the richest on the coast.

Coast Industrial Notes.

—Men are at work buildiug n dam across Douuer Lake creek, for the purpose of backing up the water over a large area of grouad. Extensive lce works are to be built.

—The governmeut dock at Fort Orchard, Wash., is about completed, and will he open for ships as soon as the chanuel te it is dredged out, which will probahly he about Dec. 1st.

—The South Yuba Corupauy will have their electric power in Sacrameato early in Novemher. They are now lighting the towns of Auburn, Rocklin, Penryn, Newcastle and Rosevilla.

—The Agricultural aad Iadustrial Association of British Columbia is holding its annual exhibition aud celebratiou at Victoria from Sept. 16th to Sept. 21st inclusive. Five thousand dollurs in prizes are offered.

—The Nevada Southern Railroad is about to pass into the hands of meu who will extend it through Lincoln county, Nevada, where considerahle base metal can be handled profitably with better means of trausportation. The ultimnte idea is to build to Pioche and on to Milford, Utah.

—"Steep Gradients on Electric Roads" is the title of a well written and handsomely illustrated article in the August issue of the *Electrical Journal*, largely descriptive of the 25 per cent Fillmore-street grade in this city, where the steep grade is overcome hy the use of au nuxilinry cahle.

—The Ceutral Lumher Co. has filed articles of incorporation here. It includes nearly all the big mill owners, the intention being to establish a big pine lumher trust and fight the British Columbia mills, which, sinee the tariff was taken off lumber, have made the husiness unprofitable in California.

—There is under consideration a scheme for making use of water power in a canyon above Healdsburg to supply Santa Rosa with electric euergy sufficient for manufacturing purposes. The plant, it is estimated, will generate from 2000 to 5000 horse power. The current will he sent to Santa Rosa via Healdsburg aad Windsor over ten wires, five being used at one time.

—The Southern Pacific management, after a careful survey of the field, has come to the conclusion that throe harrels of oil will do the work of one ton of coal. The oil can be obtained at the present time for forty cents a harrel, or $1.20 for the three harrels, as against $4.82, the cost of one ton of coal, so that the expense of fuel upon that system would he reduced from $3,446,623.36, the cost of fuel in 1894, to $862,150.80 per year, a saving of $2,584,467.52, provided the relative values of the two fuels remained the same.

—*Wood and Iron* reports that the receipts of lumber in the bay of San Francisco from all points for August of last year were 27,435,293 feet and in August, 1895, 26,950,548—a falling off of only 484,745 feet. The receipts from the Sound ports and Oregon for the past month were but 16,030,053 feet, as against 20,453,000 feet in August of last year. Del Norte county shows an increase of 140,912 feet, Humholdt an increase of 201,364 feet and Mendocino an increase of 3,595,926 feet. Thus the falling off in receipts of pine, spruce, etc., was almost made up hy the increase from the redwood mills.

—John T. Davis, of Los Angeles, makes a loud call for a smelter in that city, and figures that the silver-lead ore along the line of the A. & P. R. R. should he smelted in Los Angeles instead of being hauled to El Paso, Denver or Kansas City. Ahundance of ore is procurable with 51 per cent lead, 29½ ounces silver, $4 gold. The lead at 90 per cwt. of New York quotations, and the silver at 60 cents per ounce, would give as follows: 1020 lead at $3, $30.60; 29½ ounces silver at 60 cents, $17.70; gold, $4; total, $52.30. The ores at Los Angeles would cost as follows: Mining, $3; hauling hy team, $10; railroad transportation, $8; treatment charges, $4; total, $25; making a profit of $26.70 per ton.

—Los Angeles, says the *Manufacturer*, has six foundries, employing in the busy season from 400 to 450 men, and will during the year 1895 turn out close on to $1,500,000 worth of manufactured iron. This product will he largely increased, as the demand is now felt from fields which had previous to the discovery of cheap fuel heen considered out of the question. Pig iron is worth $24 per ton laid down there. All of the foundries are using, or preparing to use, fuel oil from the Los Angeles wells. The iron and steel works use seventy barrels per day, or over 25,000 harrels per annum, and find it most satisfactory in every way, notahly in the great saving in expense over coke.

—The reorganization of the Oregon Railway and Navigation Co. embraces the formation of a new corporation, which will issue $24,500,000 four per cent bonds, to be a second mortgage on the property covered hy the present first mortgage and a first mortgage on all the other property of the company. The new company will issue $11,000,000 four per cent non-cumulative preferred stock and $24,000,000 common stock. The common stock for the new company will be issued share for share to the present common stock on payment of six per cent assessment. Under the proposed plan the fixed charges of the new company for the first year of its operation will approximate $930,480, as against present fixed charges of $1,305,250.

—The most celehrated Peruvian railway is the Ferro Carril Central del Peru. Starting at the docks in Callao, it keeps rising until, at 106 miles from the coast, it reaches a height of 15,666 feet. It then descends, and in thirty miles falls 3489 feet. When completed, 264 miles farther, it will reach the navigahle waters of the Amazon, and this extension will probably not cost more than half as much as the finished portion. There are eight switchhacks on this road, four of them being double. There are fifty-seven tunnels in a distance of twenty-four miles, mostly through rock spurs. Work was begun on this road in 1870, the track being laid to Chicla in 1875. It was resumed in 1890, and the most difficult and important part of it, containing the two largest bridges and eight of the tunnels, being at an altitude of over 15,000 feet.

—Philip Weigel of Jersey City, N. J., says that three men in this country, of whom he is one, have planned to buy the entire interest in the Inter-Ocean Panama Canal Company, taking up the work where it hnd been left off und prosecuting it to a successful end. According to Mr. Weigel, the syndicate will begin work within the next eighteen months. By that time, he said, the privileges and grants held hy the present Panama company will have expired; and arrangements having been made with the United States and other governments to extend these privileges, the work will go on with vigor. Mr. Weigel said the agreements, releases and other accessories to the transfer have been drawn up, and the new company has simply to deliver the contract price to be in full possession.

—C. P. Huntington of the Southern Pacific is of the opinion that the Nicaraugua canal will never be built, and he gives these reasons for so believing: "We have three or four billions of dollars in eastern or western railroads in the United States, which can do the business contemplated hy way of the canal better than this can be done in any other way. Besides the fact that tolls would be exorhitant for the canal passage because of the large amount of interest to he paid in the cost of construction, we must bear in mind the extreme importance of the question of insurance of vessels and cargoes. The freight to San Francisco is only about one-fifth the insurance on certain lines of goods around the Horn. The business of the Suez canal and the importance of that artificial waterway furnish no precedent in behalf of the Nicaraugua canal." But it will he built just the same. It is a clear case of manifest destiny.

Personal.

H. P. GORDON, who for the past year has been superintending the operations of the Caravicha M. Co., in Ecuador, South America, has returned, and is at present at Plymoutb, Cal.

R. M. CATLIN, tho mining engineer, follows fourteen other Californians who have gone to South Africa at handsome salaries to take charge of gold mining properties in the vicinity of Johanneshurg.

JOHN PELTY, representing the Angostura M. Co., is traveling through Nevada and Placer counties, getting experienced hydraulic miners for the company's mines in Ecuador, South America.

HERBERT LANG, whose article on matte smelting in the issue of this journal of Jan. 12th is still in great demand from all parts of the world, is at present in Oakland, where he is superintending the plans of the smelter for the Iron Mountain Co. of Shasta.

CLARENCE KING is on Fruit Creek, Baker Co., Oregon, reporting on the Columhia mine, owned hy the Cahle Bros., to P. Blackmar of Chicago, W. J. Shedd of Denver and E. S. Field of Baker City, Or.

ISAAC BANTA, formerly an Albany, Or., gunsmith, and more recently in partnership with Messrs. Wink and Burton at Port Orford, Or., claims to have an offer of $50,000 from the Nicaragua Mining Co. for the right to use his gold extraction process, and will shortly sail for Bluefields to show the Nicaragua people how to use the secret chemical mixture that he says makes unnecessary the use of mercury.

Obituary.

W. R. RANDALL, late foreman of the La Bellevue mine, Baker City, Or., died there on the 26th ult.

DR. HENRY LEIPMAN, manager of the North Pole Mining Company, at Bourne, Oregon, died last Saturday after a brief illness. His death is said to have been caused by the inhalation of cyanide, he having used the drug in treating ores hy the cyanide process.

JAS. TULLOCH, an old-time miner and a prominent man in his section, died at Angels on the 6th inst., aged 73. He was a native of Richmond, Va., and for nearly 44 years was engaged in mining in this State. He was the inventor of the Tulloch ore feeder and Tulloch concentrator, and at the time of his death was the principal owner in the Tulloch mine.

EDWARD W. JACKSON, general manager of the Interoceanic Railway of Mexico, died in the City of Mexico, September 2d, after a week's illness. He was horn in London, England, in September, 1838, and entered railway service in Turkey in Asia in 1858. He located in Mexico in 1864, where for over 31 years he was prominent in railway construction and management.

Commercial Paragraphs.

THE Replogle Governor Works, owned by the Selle Gear Company, of Akron, O., has purchased the governor business of H. E. Olhrich, of Cedar Falls, Iowa, including all patents, patterns, etc., pertaining to electric regulators. This company has also purchased recent patents granted to Mark A. Replogle and others, in this line, and will establish itself in a business wholly devoted to the governing of water power for the various uses to which it is applied.

THE Bucyrus Steam Shovel Company, South Milwaukee, Wis., will shortly he taken out of the hands of receivers George and Eells, who have had charge of the business since last January. It is understood that most of the creditors will take an interest in the company for a part of their unpaid claims. At the time of failure Mr. Eells stated that the nominal value of the assets on Jauuary 1, 1895, was $461,841.92 and the liabilities were $259,665.55, leaving a surplus, in nddition to the $150,000 capital, of $52,176.27.

Publications Received.

"The Lixiviation of Silver Ores with Hyposulphite Solutions, with Special Reference to the Russell Process," by Carl A. Stetefeldt; second edition.

In his preface tho author modestly states that "some errors which occurred in the first one have been corrected, irrelevant matter has heen left out and a great deal of uew matter ndded." The fact is that the work is practically a new one, and is au admirable up-to-date treatise on a subject about which so much has been written. The introduction contains n brief history of the lixiviation process, a condensed account of the Russell process, a comparison of lixiviation with amalgamation, etc. Part I is devoted to the chemistry of the lixiviation process; part II, the lixiviation process in its practical execution.

There is no theory or assumption. The first part deals with matters as exact in their results as the multiplication table; the second part gives statements of what has been done aud how. The hook gives tahles of costs of treatment, results, etc. It is published and sold in the United States and Mexico by its author, Carl A. Stetefeldt, 967 Alice St., Oakland, Cal., price $5.00, postpaid.

"Journal of the Franklin Institute," Philadelphia, for September.

The principal article in this number is the report of the Committee on Science and the Arts on the Pelton Water Wheel, in which that wheel is fully described and discussed. Altogether, thirty-seven pages of this issue are devoted to this water motor, with diagrams, wood cuts and sectional views, the report concluding with the formal award of the Elliott Cresson Medal to Lester A. Pelton, the inventor of the wheel. Included in the space devoted to this subject is an appendix of thirteen pages of historical notes and data regarding the Pelton wheel and other water motors, concluding with a commendatory report of tests of Pelton water motor No. 4, made by Lieut. Haeseler, U. S. N., and Ensign Bullard, at the U. S. Naval Academy last March.

Other articles are on "Asphalts and Bitumens," "Rainfall and Typhoid Fever" and a valuable monograph on "Investigation of Utah Gilsonite," hy Dr. W. C. Day. The notes and comments are, as usual, of technical value.

"Journal of the Association of Engineering Societies for July, '95."

The principal paper is "Timher-Preserving Methods and Appliances," hy W. G. Curtis, read hefore the Technical Society in this city Dec. 7, '94. Other papers are Cost of Steam and Water Power in Montana, Wooden Bridge Construction on the Boston aud Maine Railroad, and the Engineering History of a Lawsuit Respecting a Contract for Railroad Building in South Dakota.

"Centrifugal Pumps; An Essay on their Construction and Operation, and Some Account of the Origin and Development in this and Other Countries," by John Richards; The Industrial Publishing Co., 40 California St.; Price $1.

The sixty-eight pages of this practical treatise disregard much that has been hitherto accepted as pump gospel, or refer to it only to controvert and antagonize it, the idea being from the author's standpoint to state what is expected of a centrifugal pump and how best to construct it that it may economically do its required work. The first part treats of construction and operation, the second is mainly a history of the centrifugal pump, it being shown that as a practical operative machine it is distinctively an American invention, a pump embodying nearly all the essential points of that of to-day, having been invented in Massachusetts seventy-seven years ago. The history of the different improvements, additions and special applications is given, with special reference to local manufacturers and requirements. An appendix embraces several communications from engineers, makers and users of the centrifugal pump on this coast. The work is illustrated by drawings and diagrams, and handsomely issued.

Catalogues Received.

THE finest catalogue received this week is from the Joshua Hendy Machine Works, 38–44 Fremont street, San Francisco, being the second edition of Catalogue No. 2, 132 pages, 6x9½ in. It contains practical suggestions to managers of mines, millwrights, amalgamators and millmen; illustrated descriptions of ore-cars, grizzlies, rock breakers, ore-feeders, stamps, mortars, screens, the Triumph concentrator, amalgamators, settlers, gold and silver mills complete, engines, boilers, pumps, water-wheels, with sizes, prices, tahles regarding every variety of metal mining machinery, workshop recipes, weights and measures, ordinary engineering formulæ, etc.

Alcatraz Asphalt and Its Uses, 6x9 inches, 40 pages, from the California Petroleum and Asphalt Company, San Francisco. A handsomely illustrated treatise on California's asphalt heds, and the value and utility of the company's product with analyses, testimonials and information regarding method of mining, transportation, etc.

Scientific Progress.

Lord Kelvin's Judgment on Alternating Currents.

Some interesting correspondence, origiually appearing in the London *Times*, is being collected and reprinted. In a short description of the great power plant at Niagara, George Forces, chief consulting engineer of the Cataract Construction Company, remarked that when he advised the adoption of "alternatiug currents (which had not then been practically used for power purposes), many predicted failure, and some, including our friend Lord Kelviu, have continued to do so." The distinguished foreigner here mentioned is England's greatest all-round authority in science, although he is not a specialist in electrical matters, and it was natural that Mr. Forbes should plume himself on his success in the face of such discouragement.

But Lord Kelvin did not allow the charge against him to go unnoticed. He replied, through the *Times*, with a partial denial. He said: "I told the directors that they would certainly succeed with alternate currents, but much better with continuous currents." Mr. Forbes insists, however, that in 1892 Lord Kelvin declared, in a cable dispatch, that the adoption of alternating currents would be a "fatal" or "disastrous" mistake, and in other ways evinced marked disapproval. The first vice-president of the Cataract Construction Company, Mr. Stetson, takes the matter up next, and says that in 1891 Forbes and a Buda Pesth firm alone favored alternating currents, while Kelvin and all the other members of the Advisory Commission employed by the company reported adversely; that iu January, 1894, the directors decided, nevertheless, to adopt the alternating current, and all of the original dissenters except Kelvin concurred in this policy. Thereupon, apparently after he had discovered that he was out in the cold, the eminent Englishman sent a dispatch, still evincing a strong preference for the continuous current, but intended also, as Mr. Stetsou says he is now (evidently for the first time) able to discover, to admit that alternate currents might succeed.

It is certainly fortunate that a loophole was thus provided for Kelvin's withdrawal from what would otherwise have proved to be an exceedingly embarrassing situatiou. The Niagara installation is now recognized everywhere as a brilliant engineering success. Sylvanus C. Thompson, a compatriot of the lately ennobled Sir William Thompson, writes to the *Times* politely but distinctly disparaging the latter's judgment. This verdict has the greater weight because, instead of devoting his attention to a number of 'ologies (like the subject of his criticism), Prof. Thompson has concentrated it chiefly upon electricity and magnetism, and upon those particular subjects his views are regarded with universal respect and reverence among practical electricians. He says: "Lord Kelvin's prepossession in favor of continuous currents as against alternating currents is not supported by modern electrical practice, save for the restricted purposes of electrolyte decomposition. On the contrary, for nine-tenths of all other purposes the advantage is found to lie on the side of alternating currents, wherever the distance of transmission exceeds a few hundred yards."

The thunder storms of Madras have been studied by Prof. Michie Smith, who tells the Scottish Meterological Society that the first striking fact he observed was that of certain seasons of the year when sheet lightning was seen almost every night, always in a west or southwesterly direction, aud always near the horizon. He suggests that these discharges occur in the region where the moist and dustless sea wind meets the dry and dusty land wind, one being perhaps positively electrified and the other negatively. It is not easy to explain exactly lightning displays in which as many as 300 flashes per minute have been counted, this rate being kept up for an hour or an hour and a half. The idea that sheet lightning is a reflection from a distant storm is nonsense. Another interesting peculiarity of this region is that the heaviest rains are unaccompauied by thunder, while the displays of lightning are not accompanied by rain.

At the regular monthly meeting of the Technical Society of the Pacific Coast, on the 6th inst., Mr. Edward S. Cobb, 109 California St., this city, read a paper on a new wheel, now almost completed at the Pacific Rolliug Mills, of his own design, the paper being illustrated with blackboard drawings and sectional diagrams. The wheel is 17 feet 4 inches in diameter, weighs 16,800 pounds, and is so built with rim sections, radial rim-supporting spokes and driving truss rods that when in motion every part of it is in tension except one chord of the driving trusses. The rim weighs 11,500 pounds, the spokes 2000 pounds, the hub 3300. At 130 revolutions per minute it is calculated the resisting power would far exceed any possibility of requirement in use or the remotest contingency of accident. Regarding cost Mr. Cobb's figures compare very favorably with those of other wheels of equal weight, strength and stability. The wheel in process of constructiou has been visited by a good many mechanical engineers and practical men, who have manifested considerable interest in its mode of construction.

The idea of a boiling solid is somewhat bewildering, but Prof. Dewar points out that we have such a substance in solidified carbonic acid, which has the singular property of boiliug at a temperature lower than its melting point. To illustrate this before an audience, some solid carbonic acid was pressed into a ball, suspended by a cord iu water in a glass trough, and an image of it projected upon a screen. Gas was then seen to be given off freely. The frozen carbonic acid was no colder to the fingers than common snow, because in reality it never came in contact with the skin when being handled. Another striking experiment—never exhibited before—was the burning of diamonds in liquid oxygen. When two or three red-hot crystals were thrown into the liquid they were at once cooled and sank to the bottom, but a diamond made extra hot by the blowpipe caught fire and burned on the surface of the oxygen with a steady flame

---

Helium having been found in quantity in cleveite and broggerite, Prof. Ramsey has continued the search among the less common minerals, and concludes that the elemeut is retained by minerals consisting of salts of uranium, yttrium and thorium, but that we cannot yet decide which of these three conditions has its presence. Oxide of uranium alone seems sufficient to retain it, but it is found plentifully in monazite, which contains thorium, but no uranium, and is a comparatively cheap mineral that may become an economical source for helium. Helium has the solubility of 0.007 in water at 18°, and is, therefore, the least soluble gas known.

After a spectroscopic comparison with the gas of cleveite—in which terrestrial helium was first discovered—M. H. Deslandres announces that the permauent radiations of the sun's atmosphere that are not recognized on the earth are reduced to a single one. This is a green ray, called the ray of the corona, which is peculiar to the highest regious of the solar atmosphere, allowing us to suppose that it belongs to a gas lighter than hydrogen.

The cooler regions of the globe are becoming depopulated, and everywhere, Dr. D. G. Brinton assures us, the arctic and sub-arctic zones have fewer inhabitants than a half century ago. One cause is the destruction of native tribes by the introduction of new modes of life, new diseases, alcohol and idleness. Another influence is the fact that the Arctic regions, like the mountains, were originally chosen as homes only by refugees of conquered and dispersed bands, and all who can returu to less severe climates are now doing so. The center of population tends more and more to fix itself between 45 and 55 degrees of latitude.

Scientists predict that in a century's time there will be no disease that is not curable.

Mechanical Progress.

Prehistoric Irrigation Canals in California.

The prehistoric irrigation canals of what is now San Diego Co., Cal., attract renewed attentiou. The engiueers in charge of the work knew their business. They took advantage of the topography of the country with great skill, aud developed a maximum quantity of water with a minimum of work and expense. The source of supply was of course before them—the Colorado river. All they had to do was to lead it out across the desert. They did this by constructing the great caual now known as New river. This tapped the Colorado river thirty miles above its mouth, and was cut to the divide, which separates Salton basin from the New river country. Scientific men have visited these ancient waterways and agree that the highest type of engineering ability was possessed by the constructors, whoever they were. The savants differ as to the identity of the old-time San Diegans. Some say they could not have been Indians, and hint of Phœnician origin. This is partially borne out by the discovery of Phœnician writing on the west coast of Lower California, stumbed upon by a coast-survey party. At Corn Springs, on the desert, a spot almost entirely unknowu to white men to-day, characters were found graven on the face of cliffs that were Greek to the Indians. The pictures represent men in armor with battle-axes, and images, and ships. The maiu canal leading from the Colorado into the desert had five branches, the length of all reaching nearly 600 miles. The three easterly branches connected with the Colorado, and with each other at two points. They are from 50 to 200 feet in width and 8 to 15 feet in depth, in some places as perfect in line of curvature, excavation and grade as when first constructed. There remain stretches of miles where a flat-bottom river steamer could ruu were the canals full. So cunningly are they constructed, and so accurate is the grade, that when the Colorado river at Yuma gauges twenty-two feet at the bridge the canals are full. When the river drops to sixteen feet they are nearly dry. The most easterly of the canals run into Lake Jululu, a body of water eight by sixteen miles and eight feet deep. When the lake is full one stream runs south to the Colorado and the other north into the Indian Wells country. These are connected by a third stream, and where the westerly branch enters the third the water, when the lake is full, flows both north and south. This arrangement suggests ingenuity and accurate engineering. The finishing touch to the great system is in the reservoirs, now appearing to be lakes, which join the maiu canals at intervals. These filled when the Colorado was high, and no doubt were provided with gates through which the fluid was doled out to ranchers when the big river had dwindled to a thread. What modern irrigation system excels this for magnitude or ingenuity? That such work could be constructed argues a degree of intelligence and civilization not indicated among any of the known peoples of this coast, and that their history could be so completely blotted out proves them to be of immense antiquity. In the New river country, as in Arizona, fragments of pottery and stone utensils are found, but scientists are inclined to believe that they date from Indian tribes who came later. The natural conclusion is reached that light on the history of the world may yet come from this so-called new land, which in reality was doting with age when the savages of Britain were gnawing their enemies' thigh-bones.

The Widening Use of Gas Engines.

Some of the chief difficulties to the extended introduction of the gas engine have been gradually removed by the improvements in methods and apparatus for the manufacture of producer gas on a small, yet economical, scale. In this, as in other branches of engineering, the law of supply and demaud operates to mutual advautage, and isolated gas-engine plants are rapidly coming to the front. One the other hand, for the distribution of power from a central plant to greater or less distances gas offers peculiar advantages. There are practically no losses in distributing the gas in pipe lines, except leakages, which can effect the distribution. Losses of pressure and temperature changes do not in the least effect the economy of the gas engine at the end of the line. Therefore, the distribution of power by gas, and its utilization by gas engines, scattered over a widely extended area, may come to be a rival of the other methods. And the facility of storage and use of gas for heating are additional advantages.

It seemed doubtful for a long time whether gas engines could be made and economically managed in large units; but their present use up to 300 horse power and the contemplated manufacture of gas engines of 500 horse power and upward, leave no room for serious doubting. But it is open to discussion whether there is the same inherent gain in economy in the use of large gas engines as in the use of steam eugines. Of course, on the general principles of power production, large units are more economical per horse power than small units. Nevertheless, there is scarcely an argument advauced for the use of large steam engines that can be similarly advanced in the case of gas engines.

In the matter of arrangement of gas-engine cylinders there is undoubted preference manifested for the vertical type, and in pairs, with cranks at 180 degrees apart. Four-cyliuder or quadruplex gas engines are being seriously considered, to gaiu an additional advantage along the same lines as the two-cylinder or duplex type, namely, a greater number of explosions per revolution, and, consequently, an increased opportunity to control the supply and explosious according to the load.—W. S. Aldrich in Cassier's Magazine for September.

Electric percussion drills are not, as a rule, very well thought of by mining engineers. They were originally placed upon the market without proper tests and before they had been perfected as a commercial piece of apparatus. Extravagant claims were made for them, and the results were for this reason all the more disappointing. For the past two years much has been done in perfecting the electric percussion drill. No change has been made in the principle of the drill. The iron plunger is given a reciprocating motion by two electro-magnets in the drill body, to which a pulsating current is supplied by a specially designed generator. The mountings are in every respect the same as the standard air or steam drill. The improvements made have been in reducing the heating of the coils and in devising an insulation which could not be injured by rough usage which a rock drill is called upon to withstand.

From a ton of ordinary gas coal may be produced 1500 pounds of coke, 20 gallons of ammonia water and 140 pounds of coal tar. By destructive distillation the latter is made to produce no less than fifteen specific results, one of the most important being pitch, of which it furnishes nearly one-half. It also furnishes creosote and toluene, which contains the new substance saccharine, which is 230 times sweeter than sugar.

Electrical Progress.

Bribe Taking and Giving.

The "commission" business is not wholly unknown in California, and the following from the New York *Electrical Review* will be read with some interest. That journal claims to have accumulated considerable matter bearing on the subject of bribe taking and giving, and intimates its intention to publish it. It gives the following as actual events, "suppressing the names, dates and places for the present:"

A man who had been trusted by his employer to make his purchases of goods found himself a little short of ready money and decided that the easiest way to get it was to "sandbag" some manufacturer from whom he had been buying. He went to a manufacturer named Smith and stated that he wanted 100,000 of certain goods which he had formerly purchased in 10,000 lots. Mr. Smith asked him why he was buying so heavily, as the goods might be out of date before the 100,000 could be sold. The buyer replied that he had been purchasing goods from Mr. Smith for some time, that the house he represented was gilt-edged and that he thought it was time there was "something in it for him." He was willing to buy 100,000 of the goods now if a commission of so much (naming a figure) could be paid in cash. Mr. Smith was surprised, but politely told the buyer that he didn't do business that way and that he would go to the trouble of informing his (the buyer's) employer what kind of a man he had as a purchasing agent. He did so and the buyer lost his job.

Another case was that of an electric railway contractor who was asked to bid on some new construction work. The contractor knew that the chief engineer of the road had the deciding opinion in the matter, and from conversations with him discovered that securing the contract was merely secondary to securing the chief engineer. The contractor accordingly prepared his bid, which amounted to $16,000. He went to the chief engineer's office, pulled a chair up beside him, and, drawing out a slip of paper, wrote on it "$16,000." Then he pushed it toward the chief engineer, saying, "Mr. Sanders, I think we can do the work for that figure." Sanders looked at the slip and said, "I think it would be more satisfactory if you could do it for ——" and then he held up the same slip of paper on which, under the contractor's figures, he had written "$18,000." The contractor thus discovered that the price of the chief engineer was $2000. He bought a little hand-bag, put $2000 in bills in the bag and had a boy deliver bag and contents to Sanders, who subsequently awarded him the contract.

A case in which the biter was bitten happened in a city not a hundred miles from New York. Contracts for work amounting to over $300,000 were to be let, and all the electrical contractors knew that the first thing to be done was to "see" the chief engineer. A New Yorker—Kelly we'll call him—heard of the work and immediately took a train to ——. He had the chief engineer, Jones, dine at his hotel with him. After several small bottles and other large ones, Kelly said to Jones:

"Old man, I want this work. Tell me what to bid."

Jones went through motions and intimations until he discovered from Kelly that "there was $50,000 in it for him." Then he told Kelly to bid $312,000.

Kelly returned to New York and told his partners how he had "cinched" a big contract. The bids were opened soon after this and Kelly thought he'd take a run over to —— just to see the disappointment of the other fellows. The first bid opened was for $314,000, and Kelly smiled knowingly. Next came Kelly's bid of $312,000, and finally the third and last bid was opened. It was for $310,000, and was submitted by Mr. Crane, who also carried on his business in ——. Kelly realized that he had got the "double cross," and being possessed of considerable sporting blood, took his medicine philosophically.

On his way out of the room, an angry man approached Kelly and said: "D—n that red-headed, blankety-blank engineer! He threw me down."

"That so?" asked Kelly. "How did he do it?"

"Why," replied the other, "I offered him $25,000 if he'd tell me how much to bid to get the contract. He told me a bid of $314,000 would get the work."

"That must have been before he saw me," answered Kelly. "He told me to bid $312,000, and I was to give him $50,000. We've both been done up, my friend. I wonder what the contract cost Crane?"

Kelly and the angry man kept their eyes and ears open for the next few weeks, and finally learned the sequel of the story.

One day Jones walked into Crane's office and asked for a private interview. When they were alone, Jones remarked nonchalantly:

"I've got some obligations to meet to-day and I'm a little short. I'd like to get about twenty-five thousand."

"Twenty-five thousand what?" inquired Crane, looking surprised.

"Dollars," said Jones.

"Twenty-five thousand dollars! For what?" gasped Crane, in well-feigned astonishment.

"Why, on account of my commission. You certainly remember promising me $100,000 if I told you what bid would get that contract."

"Are you trying to blackmail me?" asked Crane, threateningly. "I'll report you to your board of directors. Get out! You don't get a cent!"

But Crane didn't report Jones, and the latter had to swallow his defeat.

THE Cataract Construction Co. at Niagara Falls is reported successfully transmitting power. As heretofore explained, the current sent out is an alternating one, and before it can be used in the making of aluminum it must be transformed to a direct current. This is done by passing through four of the largest rotary transformers ever built. These are 2100 horse power each, and three of them are running.

THE current number of the *Pacific Electrician* has a very good portrait of W. S. Heger, formerly of this city, but more recently of Wilmington, Delaware, whence he comes as Pacific coast manager for the Westinghouse Co.

THE Edison Light and Power Co. on Stevenson street are now selling incandescent lamps at twenty cents each, keyed sockets at sixteen cents and keyless sockets at thirteen cents.

IT is calculated that there are now in operation in the United States 22 incandescent lamp manufacturing companies turning out 32,500 lamps daily.

Practical Information.

THE effect of low temperature upon the physical properties of matter is very striking. For instance, it is found that the vigor of chemical action decreases and the elements apparently lose their ability to combine as their temperature is lowered. Thus phosphorus and oxygen, which so energetically combine at ordinary temperatures, become more and more chemically inert as this temperature is decreased, until at 200 deg. below the freezing point of water they appear to be unable to unite. This may be otherwise stated by saying that in the absence of heat there is no chemical affinity. Heat is known to consist in the internal vibratory motion of atoms and molecules of matter, so that it appears that in the absence of such vibratory motions there is no possibility of chemical action. On the other hand, as the temperature falls, the magnetic and electrical qualities of some or all of the elements are exalted in a proportional way. Thus, oxygen, which is feebly magnetic at ordinary temperature, becomes strongly magnetic at 200 deg.; and when liquefied, as it easily may be at such low temperature, it behaves like iron to a magnet, and will adhere strongly to its poles.

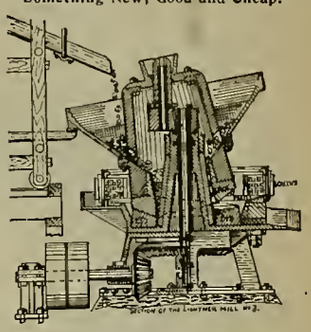
HERE is a table showing the amount of circulating medium used in nearly all the countries of the world. This table is given upon the very highest authority. France has $36.81 to each inhabitant; the United Kingdom (Great Britain and Ireland) $20.44; Germany $18.56; the United States $26.02; Belgium $26.70; Australia $26.05; the Netherlands, $24.34; China, with a population of 402,700,000, the per capita circulation is but $1.80, all silver; Roumania has $4.60; Servia $4.27; Sweden $2.71; Turkey $2.39; Central American States $3.78; Japan $4; India, with a population of 287,200,000, $3.44; Hayti $4.90; Portugal $21.06, and Egypt has $19.85 as her per capita. The South American States have $9.67; Canada $10; Cuba $12.31; Italy $9.59; Switzerland $14.48; Greece $12.22; Spain $17.14; Austria-Hungary $9.59; Norway $6.60; Denmark $11.72; and Russia, with a population of 124,000,000, has $8.17 to each inhabitant.

DR. A. M. BLEILE explains the cause of death in electric shock as follows: Death is due to the fact that the current produces a contraction of the arteries through an influence on the nervous system, and this constriction of the arteries throws in such a mechanical impediment to the flow of blood as the heart is unable to overcome. When such a drug as nitroglycerine or nitrite of amyl is given to counteract this effect, much larger doses of electricity than the ordinary can be borne. Artificial respiration may be of use in cases of simple stunning, but when large quantities of current pass, no rational means of resuscitation have, as yet, been suggested.

PURE, fresh, cold water is one of the most valuable disinfectants, inasmuch as it is a powerful absorbent. Every sick room should have a large vessel of clear water, frequently renewed, placed near the bed, or even beneath it. This not only absorbs much of the hurtful vapor, but by its evaporation it softens and tempers the atmosphere, doing away with the dryness which is so trying and depressing to an invalid, or even to persons in health, for that matter. It has frequently been shown, by actual experiment, that troubled sleep and threatened insomnia are corrected by so simple a thing as the placing of an open bowl of water near the sufferer's head.

A SINGAPORE letter to the London *Times* states that consequent upon the legislative retention of the silver guilder at the old value in the Netherlands, coining factories have been established in China and the export of guilders thence yields a handsome profit. It is estimated that $2,000,000 of such counterfeit coins are already in circulation and the evil threatens to increase.

THE extent to which a chimney can poison the atmosphere has been scientifically determined by a test made in Berlin. The soot which comes out of the chimney of a single sugar refinery was gathered for six days and found to weigh 6800 pounds.



SURVEYS and examinations of the bituminous coal beds of Pennsylvania have led the government experts to announce that at the present rate of consumption the supply will not be exhausted for 800 years to come.

AGENT IN SAN FRANCISCO:
NEWTON M. BELL, 109 California Street.

A Full Assortment of Wire Rope for Mining Purposes carried in San Francisco.

THE LIGHTNER QUARTZ MILL.
Something New, Good and Cheap.

MANUFACTURED BY
WM. H. BIRCH & CO.
Also Manufacturers of
Cary Steam Pumps, All kinds of Mining Machinery, Boilers, Engines, Ore Buckets, Ore Cars, Cages, Hoists, etc.
119 Beale St., San Francisco.

HEALD'S
Business College,
24 Post Street, - San Francisco.
FOR SEVENTY-FIVE DOLLARS
This College instructs in Shorthand, Type-Writing Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils.
A Department of Electrical Engineering
Has been established under a thoroughly qualified instructor. The course is thoroughly practical. Send for Circular. C. S. HALEY, Sec.

AMERICAN CONDENSED MILK COMPANY
WESTERN AMERICAN
99
BRANDS
SAN FRANCISCO

THE
LIXIVIATION OF SILVER ORES
WITH HYPOSULPHITE SOLUTIONS.
By CARL A. STETEFELDT.
Second Edition. Completely Revised.
Published and Sold by the Author,
967 Alice Street.....Oakland, Californ
PRICE, BOUND IN CLOTH, $5.00

WANTED!
A Gold Quartz or Copper Property,
With sufficient development work done to show up the property. Must stand a thorough and complete examination. None but a first-class property wanted. All information will be strictly confidential with buyer only. Send full particulars of property for sale.
M. KNOX,
12 Front Street.....San Francisco, Cal.

INVENTORS, Take Notice!
L. PETERSON, MODEL MAKER,
226 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential*.

WASHBURN & MOEN MFG. CO.
MAKERS OF
BARBED
BALING
COPPER
INSULATED
WIRE
ROPE
NAILS
SPRINGS
BALE TIES
WORKS: WORCESTER, MASS., WAUKEGAN, ILL., SAN FRANCISCO, CAL.
SAN FRANCISCO OFFICE: 8 AND 10 PINE STREET.
FRANK L. BROWN, PACIFIC COAST AGENT.

Professional Cards.

A. H. RICKETTS, Attorney-at-Law,
Mining Patents and matters before the Land Department a Specialty.
Crocker Building, Rooms 201, 202 and 203, San Francisco.

W. J. ADAMS, E. M.,
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Fifteen years' experience. Specialties: The saving of fine gold; vanner concentration and chlorination. Address Golden King M. Co., Alleghany City, Sierra Co., Cal.

ALMARIN B. PAUL, M. E.,
ROOM 58, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the sale of RELIABLE Mining Properties or the procuring of suitable Machinery for interest in Developed Mines.

The Evans Assay Office.
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

JOHN W. GRAY, Engineer and Surveyor.
Examination, Surveys, and Reports upon Mines, Drainage, Tunnels, etc.
Development of water for mining and domestic use, irrigation, and the production of power. General Surveying of all kinds, and plans prepared. Construction work superintended. Correspondence solicited.
Res.—923 Linden St., Oakland, Cal.

F. H. HARVEY. W. S. HUTCHINSON.
HARVEY & HUTCHINSON,
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

EDWARD S. COBB,
Mechanical Engineer and Expert.
Tests and Estimates for the improvement of Pumping, Power and Hydraulic Plants.
Will supervise the Construction. Shipment or Erection of Machinery. Will make Drawings, Estimates or Specifications.
Prices obtained for machinery of every description. Twenty year's experience.
109 California St., Rms 30 & 31, S. F., Cal.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

Everette's Mining Office.
(Pioneer Mining Geologist's Office of the Pacific Northwest.)
MINING LAW, MINE EXAMINATIONS, METALLURGY, ASSAYING AND ANALYSIS.
"Consulting Associate Mining Attorney at Law."
Will examine and report upon "Title and Exact Value" of Gold, Silver, Lead, Copper, Coal, Iron, Clay or other Mineral Properties IN ANY PART OF THE WORLD. Any information mining men may desire to know, relative to the MINERAL or COAL resources of the entire Pacific Northwest, will be honestly given.

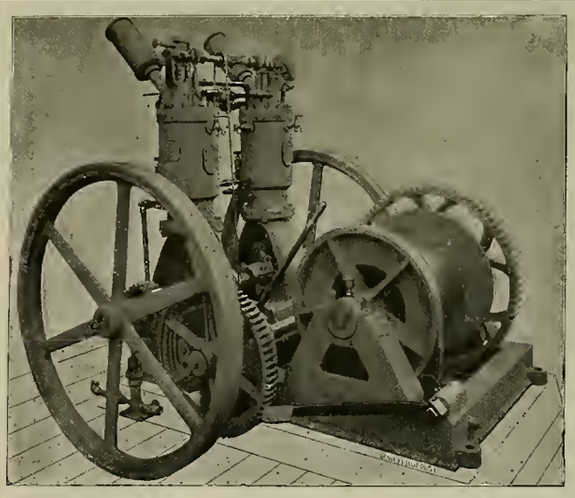
MANUFACTURERS OF
Stamp Mills, Ore Feeders
DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,
Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.



FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Millwright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Hainos, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

APACITY about ten tons. Only one-tenth horse power
uired. Adapted for either canvas or rubber belts.

ICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94¾ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully
E. L. BALLOU, Propr. Ballou Reduction Works.

MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 12. 1895.

There was a little advance in silver during the week, a drop in lead, and a general holding of prevailing prices throughout, pig iron being promised another raise. Copper is king at present, the demand being something enormous. D. Houston & Co., of New York, report that the total exports of copper for the four years ending June 30, '95, aggregate 591,225,728 pounds fine, valued at $59,057,333, which is an average of about 9.98 cents per pound. The quantity of matte and ore included in these exports was about 25 per cent of the whole, 75 per cent being in the shape of ingots, bars, etc. England is the best foreign customer for American copper, taking during the four years 281,479,621 pounds, or 47.6 per cent of the total exports during that period, an amount equivalent to 78 per cent of the total United States production for the calendar year 1894.

During the last two years ending June 30, 1895, the exports of copper to Europe were 388,608,109 pounds, or 27,763,891 pounds more than the total production in this country for the year 1894. The foreign demand for American copper the past two years under review was so great as to absorb the entire production of this country for 13 months. English home consumption of copper during 1894 was at the rate of 3.43 pounds per head of population. For the 12 months ending June 30, 1894, English imports of American copper were equivalent to 2.55 pounds per head. With consumption of copper greatly increased in the United States it is evident this country will require a much larger percentage of its output for domestic purposes, thereby reducing the available surplus for export. The stock of American copper in England and France is down to 3199 tons, a decrease of 1101 tons since July 1, 1895. Imports of American copper into England from January 1 to August 15, 1895, were 7314 tons less than during the corresponding period of 1894.

The Calumet and Hecla made a large sale about the middle of August, currently estimated to amount to 10,000,000 to 15,000,000 pounds, at 12 cents.

The market for Copper closes firm at 12¼ cents for Lake, 11⅞ to 12 cents for Electrolytic, and 11¾ cents for Casting. Only a limited quantity of Lake Copper could be obtained at 12 ¼. The tendency of the market is toward higher figures.

Mining Share Market.

SAN FRANCISCO, Septemher 12, 1895.

No greater contrast could exist than the dullness of the local stock market, wherein are listed silver mines—among others, and the activity of the London Stock Exchange, which deals in dividend-paying gold mines—among others. Of course, here it is known that no connection exists between the morihund condition of the mining stock market and the status of the mining industry, hut the tenor of many letters received from other parts of this country as well as Europe, show that this fact is not generally understood. During the week, Sierra Nevada and the two leading Gold Hill stocks—Challenge Con. and Confidence—were huoyant, Union and Yellow Jacket also advancing. In the main, business was dull.

With all hills paid to date and exclusive of the present bullion run of the Morgan Mill, Con. Cal. and Va. reports $9,450 in its treasury.

The Apollo mine, Alaska, has received hullion valued at $95,000 since July 1st.

Specie shipments from this city from Jan. 1st to Sept. 1st, '95, aggregate as follows:

Silver bars	$5,538,248
Mexican dollars	3,574,201
S. American dollars	5,298
Gold coin	4,007,623
Silver coin	258,443
Gold dust	1,605
Currency and bonds	932,771
Total	$14,318,189

Consigned as follows:

Hongkong	$5,402,951
Shanghai	3,235,600
Japan	284,194
Central America	268,298
Honolulu	221,000
Mexico	4,850
New York	4,901,296
Total	$14,318,189

For the eight months of the year elapsed the receipts of quicksilver here were 19,445 flasks, as against 17,190 during the same time in 1894 and 16,025 in 1893. The exports during the same period were 9416 flasks as against 11,078 in 1894.

The following illustrates the changes of the week:

Assessment Notices.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Fairfax, Marin County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 23rd day of August, 1895, an assessment, No. 4, of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 21st day of October, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room No. 56, No. 309 Montgomery street, San Francisco, California.

SONORA EXTENDED MINING CORPORATION.—Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of August, 1895, an assessment, No. 3, of 2½ cents per share was levied upon the whole of the capital stock of the corporation, both paid and unpaid, payable immediately in United States gold coin to the Secretary, at the office of the company, 213 Jackson Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1895, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 28th day of October, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. A. STRATTON, Secretary.

Office, 213 Jackson Street, San Francisco, California.

WANTED!

A PRACTICAL PLACER MINER,

Capable of taking charge of hydraulic plant.

Address, stating salary expected, TEMPLE BAR, Kingman, Arizona.

Hydraulic Mine for Sale.

Not on a navigable stream; in northern California. Good dump; no trouble with tailings; 180 acres of mining ground; 5000 inches of water. Can work eight months in the year. Ample opportunity given a buyer to fully test the property before payment is made. For further details,

Address X, 2022 W St., Sacramento, Cal.

TUBBS CORDAGE CO.

(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. Extra sizes and lengths made to order on short notice

611 and 613 FRONT ST., San Francisco, Cal.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 27) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows:

A REVOLUTION IN ORE PULVERIZING.

THE

Merralls Hydraulic Quartz Mill,

The Greatest Ore and Rock Pulverizer in the World, Either Wet or Dry.

THE ONLY MILL BUILT THAT RIVALS STAMPS. Our six-foot mill (No. 1) will reduce more ore or rock to pulp than a ten-stamp mill, with less than one-half the power and less than one-half the wear and tear, besides saving a much larger per cent of the gold in the ore.

This mill will reduce from 25 to 500 per cent more ore than any other rotary mill in use. Cheap, simple and economical. Four sizes built—from 15 to 250 tons capacity.

Send for Circular. Address

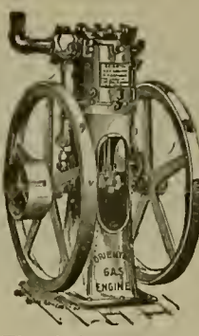
NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PRESS FOR PACKING FRUIT.—Antony C. Donotovich and James Porteous, Fresno, Cal., said Donotovich assignor to said Porteous. No. 544,866. Dated Aug. 20, 1895. This invention relates to means for packing fruit into boxes in such a manner that it shall lie therein in separate packages or parcels, whereby any one or more of said packages may be removed from the box without difficulty. The press consists of a compartment mold to receive the fruit, an underlying platform to support and hold the box up to the mold, a means for regulating the height of the platform and holding it where regulated, and a plunger adapted to enter the compartment mold and force the fruit therefrom into the underlying box. There is also a supply mold in which the operatives place the fruit, each in his own mold until all the compartments are full. The operative then delivers the supply mold upon a temporary base to the operator of the machine who places the supply mold directly over the receiving compartment mold in the machine, then withdrawing the temporary base of the supply mold he brings down the plunger and presses the fruit out of the compartments of the supply mold into the compartments of the main mold and down therein into the underlying box which at this time is pressed up by the platform close up under the main molds and forms a bottom therefor. This operation is repeated successively until all the fruit is pressed through the two molds into the box which, as it is filled with successive layers, is gradually lowered, and as many layers are pressed into the box as are necessary to complete the packages or parcels, and these lie separately and independently in the box and are pressed closely together, though readily separable.

FRUIT CRATE.—Charles S. Chamberlain, Oakland, Cal. No. 544,881. Dated Aug. 20, 1895. This invention relates to improvements in boxes or crates for the transportation of fruit in such a manner that the fruit will be perfectly ventilated and will not be bruised by any handling the crate may undergo. The crate consists of top and bottom boards with sides composed of vertical strips having transverse triangular strips fixed across their ends to connect them together and at a distance from the ends sufficient to form a space to admit the top and bottom boards of the box which are nailed thereto; wire gauze screen material having a top and bottom nailed to the transverse triangular strips, and the sides extending beneath and nailed to the vertical side strips, together with a series of trays consisting of open center frames, the inner walls of the trays being beveled to present an inclined surface to the fruit, the trays being laid successively into the exterior case with sufficient space for a layer of fruit in each tray.



HORSE BREAKING APPARATUS.—John W. Green, Cotati, Cal. No. 545,228. Dated Aug. 27, 1895. This invention relates to an apparatus which is designed for the purpose of breaking and taming horses and correcting bad habits. It consists of three bands connected with the front legs of the horse, ropes leading from the hands and connecting with the head-stall, a rope secured around the upper jaw having a knot or protuberance pressing over the front of the nose, guides through which the rope is led over the top of the head and the hips of the horse to a point of attachment upon the wagon, whereby the horse is obliged to move his legs by the movement of a vehicle and is prevented from kicking.

STREET CAR BRAKES.—Henry T. Atkinson of Oakland, Cal., assignor of five-twelfths to J. E. Morris of same place. No. 545,217. Dated Aug. 27, 1895. This invention relates to a device which is especially applicable to brakes to be used upon street cars. It consists of a flexible chain connected with the brake-rod, a direction pulley around which it passes, a cam fulcrumed in a standard upon the car, around which the chain passes, a lever with which the cam is adjustably connected, said lever being movable to draw the chain up with a gradually decreasing motion and increasing power and to release it by reverse movement. It also consists in a pawl and ratchet mechanism for raising or lowering the post to adjust it for elongation of the chain, and in mechanism for readily altering the relative position of the cam and actuating lever.

CAR COUPLING.—Rebecca M. Ford, Oakland, Cal. No. 545,645. Dated Sept. 3, 1895. This invention has for its object to provide a device by which cars are automatically coupled when they come together, and a means for withdrawing the pin and releasing the coupling from either side without passing between the cars. It consists of a draw-bar and bumper, a spring-actuated sliding block movable in the chamber within the draw-bar and normally held in line beneath the pin opening so that the pin is prevented from falling through the draw-bar; inclined levers fulcrumed at their central points upon the ends of the car above and to each side of the line of the pin, a link occupying the space between the separated inner ends of the levers and pivotally connected therewith; a chain connecting a coupling pin with the link, and connections with the outer ends of the levers whereby the coupling pin may be withdrawn by an operation upon either side of the car.

EXTENSION FIRE LADDER AND TRUCK.—Alexander B. Cairnes, San Diego, Cal. No. 545,643. Dated Sept. 3, 1895. This invention relates to improvements in extension ladders and the trucks upon which they are usually conveyed, the whole device pertaining to apparatus employed by fire departments. The object of the invention is to provide a ladder capable of being raised to any desired angle between the horizontal and perpendicular, and which may be extended to any practicable distance by means of two or more supplemental ladders slidable upon the lowermost one; a mechanism by which they are raised, extended and turned about to reach any point with relation to the original position of the truck without changing the ladder, and a means for steadying and bracing the ladders after they have been raised and turned to the desired position.

The Oriental Gas Engine

IS THE BEST because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline. It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it. Send for circulars and prices if a good safe engine is what you need.

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at **Greatly Reduced Prices.** Having made and sold these mills for the past 14 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can he safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the ma·ket that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

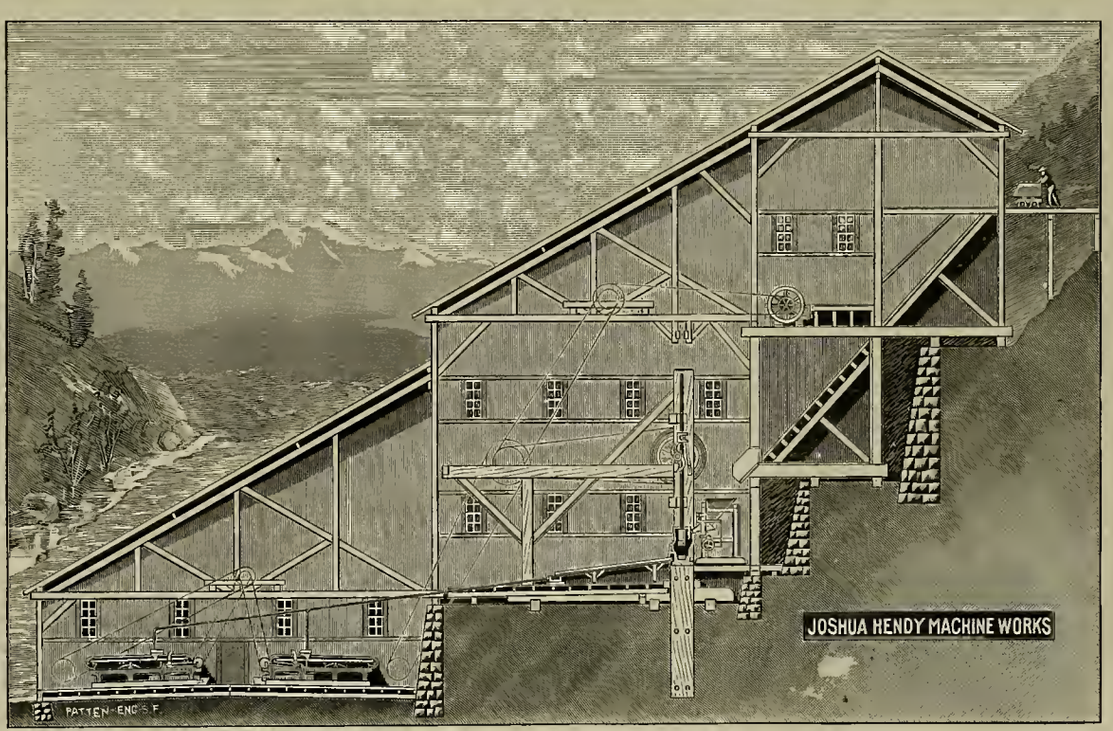
AND PACIFIC ELECTRICAL REVIEW.



VOLUME LXXI. Number 12. SAN FRANCISCO, SATURDAY, SEPTEMBER 21, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Modern California Stamp Mill.

The accompanying illustration pictures a modern California quartz mill of twenty stamps, as built at the Havilah or old Hendy mine at Nashville, on the Cosumnes river, in El Dorado Co., Cal. The general arrangement of machinery, from the grizzly through rock breaker, ore bins, Challenge feeders, stamps, etc., is the standard California style. The stamps, weighing 1100 pounds each, are of the heavy type, intended for a fast and low drop. The stems are of refined iron, 3½ inches in diameter by 15 feet long. Shoes, dies, cams and tappets are made of steel, and the cams are so constructed that a very quick drop can be obtained without "strikiug." It bas long been known that there is economy in a fast drop and this has been fully demonstrated in this case. Tbe stamps in this mill are dropping 107 times per minute and the capacity is within a fraction of four tons per stamp per 24 hours, discharging tbrough a 40-mesh screen. The fast drop produces a very lively splash in the mortar, which is the cause of the high capacity. The mortars, weighing 6000 pounds each, have very large screen surfaces, the length of the screen being the full lengtb of the mortar, without any obstructions at the ends, as the lugs for the keys are brought out beyond the end walls. The mortars have inside electroplated copper plates, made of $\frac{3}{16}$-inch-thick copper, plated with three ounces of silver to the square foot. Tbe outside amalgamating tables have for each five stamps a five-foot wide by twelve-foot long plate, made of five-pound copper, plated with two ounces of silver per square foot. From tbe copper plates the pulp flows through iron pipes ou to six 5-feet wide Improved Triumph concentrators. Each of these concentrators handles in tbis case from 12 to 13 tons of pulp per 24 hours. In grading tbe millsite about 1200 cubic yards were removed, 25 per cent of wbich bad to be blasted. About 400 percb of retaining walls were built, making the ground perfectly solid. The battery frames, of the knee type, are huilt of heavy timber, and the ore bins likewise are suhstantial and intended to stay. The mill-building frame is of the skeleton type, covered with boards and battens. The entire plant was ready to run in forty days after the date of order—machinery manufactured, shipped to El Dorado, bauled fourteen miles to Nashville, millsite graded, lumber furnisbed and framed, mill building put up, and all machinery, including two steam engines, one for stamps and one for concentrators, erected ready to run. The entire plant was contracted for hy the Joshua Hendy Machiue Works of this city hy their engineer, John O. Norbom, who tben bad just finished tbe 40-stamp mill at Plymouth, in Amador Co., Cal. This mill was manufactured and erected in tbe remarkably short time of 45 days.

A DEL NORTE COUNTY HYDRAULIC MINE.

MODERN CALIFORNIA TWENTY-STAMP MILL.

Hydraulic Mine in Del Norte County.

Herewith is a picture of the R. W. Miller hydraulic mine, on Smith river, Del Norte Co., eight miles from Crescent City, which was worked for the first time last winter with good results. This miue at the present time enjoys the distinction of heing the only mine equipped for hydraulic mining in Del Norte county. The claim consists of forty acres of gravel, which it is thought will prove a paying property. In the near vieinity are several other bars which, with the outlay of a small amount of capital, could he made to pay handsomely. The cut is furnished by Mr. J. E. Eldredge, who engraved it from a photo taken by J. J. Owings.

Much is being at present said regarding tbe great eagerness shown by the people of London and Paris for shares in Rand, South African mines; but the craze is not so surprising. The fact that some of the mines in that region produce so prodigiously that the June output of gold aggregated $4,000,000 is sufficiently dazzling to draw unwary iuvestors into schemes of doubtful value. It is the opportunity of the era for unscrupulous men to create and unload worthless stock schemes, the genuine being so easy to counterfeit aud pass before the victims discover their mistake, and the game is being worked for all it is worth. That the inevitable crash will injure legitimate mining the world over is manifest, but such injury will be but temporary. In this regard an article on page 185 is of iuterest.

Some of our Eastern cousins evidently have little idea of the vast extent of the metal mining industry of this region, which in '94 produced $40,000,000 iu gold, $47,000,000 in silver, $30,000,000 in copper and $15,000,000 in lead. The five greatest transcontinental railroad systems in the country together produced no such business result as this. They paid no such wages, made uo such profits, and did not add to the nation's wealth as the mining industry bas done. The mining industry, too, adds this to the permanent wealth of the nation in a degree unapproached by the product of any otber industry.

The Mineral Land Committee and the Corporations.

At the November, '94, meeting of the California State Miners' Association the manifest intention of the railway corporations in this State to unjustly and illegally absorb and secure title to a large part of the unpatented mineral area of the State caused a general discussion of the matter, which resulted in the unanimous conclusion on the part of the 507 delegates that immediate action was necessary. To take such required action a "committee on the protection of mineral lands" was appointed. It immediately organized and has energetically and successfully carried on proceedings that resulted last June in checking the process of wholesale absorption that had been begun. Recognizing this, the railway corporations made overtures of compromise, which were heard and intimation given that if the terms of such proposed arbitration were put in writing the communication would receive due consideration from the committee.

Accordingly the S. P. & C. P. Co.'s, under date of Aug. 20, '95, made a proposition to the committee acting on behalf of the association, which was given considerable attention, the unanimous judgment of the members of the committee being that the provisions and requirements of the proposition were so one-sided and unfair, so subversive of all that the committee had worked for and secured, and so contrary to the interests of the association creating the committee, that without considerable modification, amounting, virtually, to a new form of agreement, the proposition could not be seriously entertained.

After much thought and conference an answer to the proposition was drafted, and on the 17th inst., after unanimous endorsement by the committee's members, was sent.

The full official text of the answer is as follows:

SAN FRANCISCO, CAL., Sept. 17, 1895.

W. H. Mills, Esq., Offices Southern Pacific Company, San Francisco, Cal.—DEAR SIR: The California Miners' Association's committee for the protection of mineral lands respectfully advise you that the proposition contained in your letter under date of 20th ult., addressed to John M. Wright, Esq., representing this committee, has been duly considered by said committee, and said committee unanimously accepts your said proposition, provided it be modified by the incorporation of the following provisions:

First—Upon the one part, the party to the proposed agreement shall be the California Miners' Association, and you are advised that said association acts in the premises by this, its "committee for the protection of mineral lands."

Upon the other part, the parties shall be the following-named railroad companies, owning or controlling what are known as "Congressional grants" of land situate within the State of California, such grants being, as defined by the statutes creating them, respectively, to wit: The Southern Pacific Company, the Central Pacific Railroad Company, the Western Pacific Railroad Company, the California and Oregon Railroad Company, and the Southern Pacific Railroad Company.

Second—The proposed agreement shall apply to all the unpatented, odd-numbered sections within the limits of the land grants and indemnity land grants of said railroad companies within the State of California, and not merely to lands lying within six miles of any mineral entry, claim or location.

Third—The proposed agreement shall apply only to those protests and contests against the patenting of said lands which have heretofore been made or instituted and those which might hereafter be made or instituted by or under the auspices of the California Miners' Association as such, and shall not be held or understood to include or apply to any contest between said railroad companies or any of them and any individual claimant of land.

Fourth—The two commissioners to be selected under the proposed agreement—the one by the railroad companies and the other by the California Miners' Association—shall be appointed within thirty days from and after the concurrence of the parties in the proposed agreement and shall examine and report upon the character of said unpatented odd-numbered sections of land, by sections where the lands have been surveyed, unless there are such differences in the situation or character of different parts of the same section as, in the opinion of said commissioners, to require its classification by subdivisions, in which case the examination and classification of every such section shall be by twenty-acre subdivisions. If the lands examined are not surveyed classification shall be made by tracts of such extent and designated by such natural or artificial boundaries to identify them as said commissioners may determine.

In all cases where said commissioners shall agree as to the character of any of the lands embraced within any list of selections submitted to them for examination their decision shall be final; but in every case where they shall disagree as to the character of the lands within any such list, they shall have power and it shall be their duty to appoint a third commissioner to act with them, but only in deciding upon the character of those lands within any such list the character of which shall be so in dispute, and when the character of such disputed lands within any one list or selection shall have been decided, thereupon immediately the powers and employment of such third commissioner shall cease. In all such cases where three commissioners shall act the decision of any two of them shall be final.

Fifth—The proposed agreement shall provide: That said commissioners shall classify and report as mineral lands all lands which, prior to their examination by said commissioners, shall have been located or patented as mineral lands or which have, or probably will have, a market value by reason of the mineral which they contain, or which show such indications of deposits of valuable minerals as would induce a miner to spend his time or money upon them, with the reasonable expectation of finding mineral in paying quantities, or which, from their geological formation or location in a well-defined mineral belt, or their situation or property in equity, or relation to known mineral lands, are, or probably will be, valuable for the mineral therein; and that all these matters shall be considered by said commissioners in determining the mineral or non-mineral character of such lands and in classifying the same; and that where mining locations shall have been made or patents issued for mining ground in any section of land before its examination by said commissioners such location or patent shall be taken as prima facie evidence that the forty-acre subdivision within which such location or patented ground is situate, is mineral land; provided, said commissioners shall not consider the word "mineral" as including iron or coal; and provided further, that said commissioners shall examine and classify said lands without reference or regard to any previous examination or report or classification thereof.

Sixth—Within a certain time after the coming in of each report of said commissioners (which time shall hereafter be fixed by rule) a relinquishment or abandonment shall be filed in the proper land office by the railroad company affected by such report of all the lands designated in such report as mineral lands, and such relinquishment or abandonment shall be final and irrevocable.

Seventh—It shall be stipulated that no further action shall be had or taken in or by the Land Department of the United States or by any of its officers on any protest or other proceeding heretofore commenced by the California Miners' Association or under its auspices against the patenting of any of said lands, and that no further action shall be had or taken toward the patenting of any of the lands affected by any such protest or proceeding until after such commission shall have examined and reported upon the lands affected by such protest or proceeding, and the railroad company affected by such report shall have filed in the proper land office its relinquishment or abandonment of the lands classified in such report as mineral lands; provided, however, that any such protest or proceeding shall forthwith be withdrawn upon the withdrawal of the railroad company affected by such protest or proceeding of the list of lands to which such protest or proceeding relates and the filing in the proper land office by such railroad company of a sufficient stipulation or other guaranty that such list shall not again be filed, and that no other and further action shall be had or taken toward the patenting of any of the lands included in such lists until after such commission shall have examined and reported upon the lands inclued in such list, and the railroad company affected by such report shall have filed in the proper land office its relinquishment or abandonment of the lands classified in such report as mineral lands.

Eighth—And it shall be further stipulated that upon the filing of the relinquishments or abandonments above provided for all protests and proceedings affecting the lists embracing the lands so relinquished or abandoned which have heretofore been, or which may hereafter, pending these negotiations, be made or instituted by or under the auspices of the California Miners' Association, shall be dismissed, and thereafter no other and further protest or proceeding shall be made or instituted by or on behalf of said association or under its auspices, obstructing or intending to obstruct the patenting of any of the land embraced in any such list and reported by said commissioners as non-mineral lands.

Ninth—No list of selections shall hereafter be filed in any of the United States land offices in this State by said railroad companies or any of them until such commissioners shall have examined and reported upon the lands embraced in such list.

Tenth—Either side to the agreement may at will discharge or remove any commissioner that may have been appointed by it, and shall appoint another commissioner in the place of the one so discharged or removed, provided that no such discharge or removal shall take effect pending examination and report by such commissioners upon any list of selections submitted to them for examination and classification, the time within which such examination shall be made and such report submitted to be hereafter fixed by rule. The discharge or removal of either of the first two commissioners shall operate to remove the third commissioner, if any he then acting, but such third commissioner may be again appointed in the manner above provided.

Eleventh—Each side to the proposed agreement shall defray the compensation and expenses of the commissioner appointed by it, and in all cases where a third commissioner shall be employed his compensation and expenses shall be paid jointly by the two sides.

Twelfth—The proposed agreement shall be operative until Congress shall have passed some law providing for the classification of said lands.

The views above expressed are concurred in by Hon. J. H. Neff, president of the California Miners' Association, specially acting as a member of this committee by the request of executive committee of said association.

Should the foregoing provisions be acceptable to you, this committee will be pleased to join you in formulating a set of rules for the government of the parties and of said commissioners in carrying out the proposed agreement; and in this connection this committee submits that the provisions of the act of Congress, entitled "An act to provide for the examination and classification of certain mineral lands in the States of Montana and Idaho," approved February 26, 1895, and the rules promulgated by the Land Department for the purpose of carrying such act into effect, should, as far as they may be applicable, furnish the basis for a system of rules that shall be established for carrying the proposed agreement into effect.

Very respectfully,

A. H. RICKETTS, Chairman.
JOHN M. WRIGHT.
CHARLES T. YALE.
C. E. HOFFMAN.
E. C. LOFTUS.

Committee of the California Miners' Association on the Protection of Mineral Lands.

The proposition is fair, specific and exact; it is true to the interests of the association and just as regards the claims of the corporation.

The above is given place here purely as a matter of record, for in future years all these matters will come up for final rehearing. It is not probable, barely possible, that the proposition of the committee will receive affirmative reply. That Mr. Mills will reply is certain; that his reply will be worthy of him and fully sustain the reputation he bears of being a skillful writer is equally certain. But it is not at all probable that anything will come of this correspondence that can result in compromise or arbitration. The facts themselves, the nature of the case, and all attendant circumstances and surroundings are against such result, however desirable it may seem to be.

Regarding the coming miners' convention in this city on the 14th of next month, it is in order to say that the mineral lands committee will occupy the most important place in the transactions of this convention of the California Miners' Association. The assertion has been made that it occupies too prominent a part; that its work is unnecessary, for the railroad company will do better in this regard for the miners than they can do for themselves; that the association has strayed away from its original proposition looking to the rehabilitation of hydraulic mining and is busying itself with matters beyond its original province or purpose. Whatever the committees of the association should or should not do regarding other things, this much is certain: that at the last convention in November '94 it was the topic of general discussion in and out of the convention that the corporations were trying to absorb the unpatented mineral area of the State, and after full and free debate and in clear understanding of the matter it was then decided that a committee be appointed, not to "fight" the railroad or anything else, but to protect the mineral lands of the commonwealth to its citizens and put a stop to illegal acquirement of those lands on the part of any one. Just what this committee has done is a matter of history. It has succeeded in checking such illegal acquirement on the part of the corporation: by intelligent effort it has done just what it was delegated to do: it has succeeded in the accomplishment of the purpose for which in good faith it was created, and now, because of that very success, some of those who created it or acquiesced in its creation seek to destroy its work, nullify its influence and undo all its service to the State and to the association. Such action is unworthy honorable men. In those things private gain or personal feeling or disappointed expectations should give way to the public good, to the best interests of the association and the State.

Corporate influence is trying to make itself felt in the councils of the association and is seeking insidiously to subvert and destroy what it could not otherwise overcome. It is asserted that an effort is now making in certain counties to secure a sufficient number of delegates to do the work of the railroad; that the C. P. & S. P., recognizing the successful antagonism of the mineral land committee, has silenced or made passive some of the State press susceptible of being so influenced, and that sufficient representation is to be secured in the convention to deal a death blow to the committee and its work, and that, too, by the hands that should uphold it and carry on the work so ably begun.

Had the committee on mineral lands been content to perfunctorily perform a few preliminary duties, and then relapse into harmless quiescence, it would not have been assailed; it has, however, been too industrious, its members have followed out their instructions too faithfully and intelligently, and the result has been so annoying to the corporations which had planned to acquire so much of the State's

unpatented mineral area that the committee has ome under corporate displeasure, a fact which hould commend it to the miners and the public gen-rally, instead of being cited as the reason for its essation or discontinuance.

It is an exemplification of the old fable of the bundle of sticks. With singleness of purpose and unity of effort the miners of this State have done much, and can do more. If they allow themselves o be hoodwinked by corporate influence and allow railroad representation to dictate their actions and direct their policy, they cannot complain if they find out, too late, that they have been betrayed, and that the corporation they successfully opposed and almost brought to terms that would insure public justice had succeeded in the convention of '95 in checkmating their efforts by subtle schemes of division and debate, and introducing discord where harmony and unity of purpose alone should exist.

That it is deemed necessary to say this is unfortunate, but it is always best to be frank in those matters, and it is believed that in this case the best action for the different county mining associations to pursue is to send as delegates men known to wear no corporation straps nor collars; men who understand the situation and with courage enough to stand by the right.

From best obtainable sources it is estimated that twenty-one dividend-paying incorporated mines paid $1,342,680 in the month of August, and that fifty-eight incorporated mines paid $7,102,800 dividends during the first eight months of '95. These amounts by no means include anything like the aggregate of dividends paid by mines in this country. Several times this journal has essayed to furnish an approximately correct list of dividend-paying mines, but it has been found impossible to make and keep it all-embracing and correct. Many of the most profitable mines—particularly in this State—are private, unincorporated business concerns, and, of course, as disinclined to furnish information regarding their private business as any other business enterprise. Hence the impossibility of furnishing exact or correct data under this head. It is to be said in this regard that while dividends are justly indicative of profit, yet, unusually "declaring a dividend" in an incorporated company is not always a guarantee of present or permanent prosperity. It would be better, especially in this State, if more publicity were given the gold output. In Colorado, South Africa, and elsewhere great effort is made to publish the gold output, dividends declared, etc., as a splendid advertisement. Here in California we take it for granted that everybody knows that this State is in every way the best gold-producing region in point of accessibility, advancement in mining methods, comfort of living, quantity and quality of gold-producing area, etc., forgetting that a large part of the world's inhabitants, and even a very large percentage of United States dwellers have a misty idea that California is one of the has-beens and that this State is no longer a gold-producing region. Our mutual interests—consumers, gold producers, manufacturers, and all—would be better conserved by a wider diffusion of facts in this regard.

Concentrates.

The Morning Star gravel mine has declared dividend No. 57 of $4 per share.

The August payroll of the Anaconda, Montana, smelters aggregated $250,000.

The Nevada Reduction Co. has incorporated at Elko, Nev.; capital stock, $30,000.

The Angels *Voice*, of Calaveras Co., is told that the Tulloch mine has been sold to New York men for $40,000.

W. H. Blaisdel, of Yuma, Arizona, is reported to have bought the Worrington mine, Havilah, Kern Co.

Husted & Goff have sold their Husted mine, Hassayampa district, Arizona, to Basford & Keating for $15,000.

The Black Oak mine, sixteen miles from Auburn, Placer county, is reported sold to a French syndicate for $75,000.

There will be a creditable mineral exhibit at the Oregon Industrial Exposition, which opens at Portland on October 5th.

The Merced G. M. Co.'s stock is quoted in Boston at $43 on sales. There are 300,000 shares, which seems reasonably dear.

The Pioche, Nev., *Record* says all of the aluminum coins issued by the DeLamar Company are being replaced by silver coins.

The California Miners' Association will hold its annual convention in this city on the 14th of next month. The several county miners' associations are entitled to representation therein on the basis of one delegate for each ten members of each association.

The English Mountain mine, in which O. O. Howard is interested, near Graniteville, Nevada Co., is reported closed down.

According to a Trinity county paper a seven days' run at the Altoona quicksilver mine resulted in "420 flasks of quicksilver."

Indications are that the Harmony drift mine at Nevada City will soon be on the list of California dividend-paying gold mines.

Robert McMurray has bought the Tip Top gravel claim, Nevada Co., and the adjoining West Harmony works and machinery.

The new mining company at Globe, Arizona, incidentally announce that they are not in the merchandise business and will keep no store.

The Calamet and Hecla Mining Co., which has already paid $1,000,000 in dividends this year, will pay a third $500,000 dividend on the 18th of next month.

The Miners' Union picnic held two weeks ago at Anaconda netted $935.30, which will be forwarded to the miners of the Coeur d'Alenes who are now on strike.

The Vallejo Quicksilver Mining Company has been incorporated at Fairfield, Solano Co., to mine quicksilver in Napa Co. Capital stock, $100,000; amount subscribed, $23,000.

The Mount Pleasant Mining Company of California has incorporated here: C. F. Kinsman, W. A. Boole, J. W. Butler, E. R. Smith, J. W. Farren, S. P. Lunt, W. H. H. Hart; capital stock $1,000,000.

The *New Northwest* predicts that Montana will produce $4,000,000 in gold this year and about 13,000,000 ounces of silver, of which latter metal one-half will come from copper ores, the same as last year.

W. B. McCabe, formerly a California miner, now employed in the Anaconda mine at Butte, Mont., has fallen heir to $250,000 by the death of W. P. Dolan, who some years ago adopted him as his son.

The regular weekly sale of the Anaconda copper mine is reported, this time to "an Anglo-American syndicate" represented by Kahn, Loeb & Co. of New York, and the Rothschild Exploration Co. of England.

The Redding *Free Press* has begun a daily edition, which it says is justified by the increase in business there incident to the extensive mining developments now going on near Redding, notably the operations of the Iron Mountain Co.

Of Butte's two teams of rock drillers, Burns and Campbell drilled 36 9-16 inches in the tournament at Victor, Col., and captured the first prize of $600. Freethey and Tallon won the first prize of $500 at Cripple Creek, with 35 15-16 inches.

The Phœnix *Herald* claims that "Arizona puts out more copper value to-day from her great copper mines at Bisbee, Clifton, Globe and Jerome than all other sections of the United States." The Butte, Montana, papers are still to hear from.

Good reports come from the property of the Boulder Mining Co., in San Bernardino Co., thirty-five miles southeast of Salton. The company has six claims, on which eight shafts have been sunk and four tunnels run, $20 ore being reported in considerable quantity.

The July gold output of the Rand district, South Africa, is reported to be 199,453 ounces, 1488 less than that of June, but greatly in excess of the July, '94, output, which was 167,953. The augmentation is still further illustrated by comparison with the output for July, '93, which was 126,169 ounces.

Geo. W. Starr is now consulting engineer for Barnato Bros., South Africa, at a salary of $35,000 per annum. C. S. Richardson and E. R. Ahadie, two Nevada county miners, are superintending mines under control of the Barnatos, the former being in charge of the Lydenburg property and the latter of the Buffelsdorn.

On account of the uncertainty of the boundary line between Riverside and San Bernardino counties, owners of mining claims on the borders of these counties are confused in recording the locations of their claims. The supervisors of those counties owe it to the miners to have definite maps and records made to obviate such confusion.

Items appear now and then regarding discoveries here and there of clay deposits "carrying 35 per cent aluminum," and buoyant theories evolved therefrom. It is probable alumina is meant. A good deal of clay contains about that percentage of alumina, but as alumina contains ordinarily about 6 per cent of aluminum, it is evident that the distinctive difference is worth noting.

It is necessary, says the *Tidings*, to remove the old Wyoming dump in building the new forty-stamp mill at that mine, near Nevada City, and the men thought that powder would be the most effective way. A drift was run under the dump, and on Saturday about 1000 pounds of black powder were used to blow it up. It worked to perfection and loosened up the big dump and scattered it for hundreds of feet.

The Nevada *Transcript* tells of a mine in that vicinity that remained unworked for several years, and upon which operations have recently been resumed, which is looking so well now that the owners are said to have declined an offer of $25,000. This is another instance of where a mine that has failed to pay under one management has been taken hold of by other parties and developed into a valuable property.

Dr. David C. Day, chief of the department of mines, who is busy preparing the statistical column of minerals at the Atlanta, Ga., Exposition, says: "You can see just how much coal is mined in Alabama in a minute, how much granite is quarried in Georgia in the same time. So with the rest of the minerals. I believe it will be better than the column exhibited at Chicago. There the output for one second was shown, here it will be for a minute. The column will be thirty-four feet high."

The Desert Queen gold mine and adjoining claims in the desert, on the border line between San Bernardino and Riverside counties, are reported in possession of McMillan & Co., of Denver, Col. The price paid was $100,000 for the Desert Queen; the five adjoining claims have been bonded. The Desert Queen was discovered by McHaney Bros. a few months ago, and a five-stamp mill has turned out considerable free gold. The new proprietors are credited with an intention to put up a 100-stamp mill.

At Wardner, Idaho, last Saturday the Bunker Hill Company paid its mill and mine employes for labor during the month $29,000, an increase of $10,000 over last month. It is thought the amount to be distributed by the company on the 15th of next month will exceed $35,000; this added to the Last Chance payroll for the month of September, which will be between $12,000 and $15,000, will give Wardner a payroll of between $45,000 and $50,000 per month.

A case of interest to investors in Mexico has been decided by the Supreme Court of the State of Durango. The Inde Mining Company, of which H. R. Walcott of Denver is president, wishing to reopen the mine Del Agua, which had been shut down, applied to the local court for an order ejecting an intruder, and one week later the company's representative was put in charge. The intruder applied to the federal judge for a stay of proceedings, but this was denied. The case is considered a test in the protection of foreign mine owners.

A London cable says: The speculative mania in South African stocks shows no sign of abatement. Stock Exchange dealers compare the present time with that of Law's Mississippi inflation in France and the South sea bubble in England. Men who were financially broke two years ago now boast that they are worth tens of thousands of pounds. Stocks that were quoted in June at £1 are now quoted at £40. Brokers who were recently struggling to keep their heads above the water now employ a large corps of clerks and net enormous profits. Barney Barnato, the leader of the boom, who at one time was an itinerant juggler, is now a multi-millionaire. He is about to build a palace in Picadilly which will cost £250,000.

Discussing phases of the South African gold mining boom, the current number of *Bradstreets* says: London's mining excitement has assumed a form which has had no parallel since the speculative railroad craze in the forties. Indeed, some of its manifestations recall the days of the South Sea Bubble, or Law's Mississippi scheme, which convulsed and nearly ruined France in the preceding century. The continental public has joined with avidity in the boom, and indeed, its remarkable vitality is in a great measure attributable to the glowing reports which the scientific delegates of German investors have made upon the condition and prospects of the South African gold fields. The London financial press continues to devote the major part of its space to mining matters. But while the intensity of the excitement, as revealed by enormous dealings, by large advances in all classes of mining and development company securities, and by the ease with which a succession of new ventures are floated, have been faithfully recorded, there is an absence of note of warning except of the most perfunctory kind. The same authorities which are so watchful in warning the public against American railroad securities indulge only in the quietest kind of admonition against the evils of overtrading where South African and West Australian mines are concerned. Viewing the recent record of the London mining share market, it is seemingly impossible to reject the conclusion that the craze is fast culminating, and that even with foreign buying its life cannot be prolonged for any length of time. As an example of the state of affairs which now exists, one of the leading London financial papers examines the record of a group of South African enterprises, consisting of eight mining companies and three trusts or financial concerns. A few months ago the market value of their shares was £11,935,000. They have since appreciated by the enormous amount of £13,528,000, the aggregate values at the current market quotations being no less than some £25,400,000. Inflation of this kind can have only one result. Nor is the market without incidents which, when viewed in the light of past experience, are even more indicative of coming collapse.

"Sending Pictures by Telegraph."

The illustrated description of "Sending Pictures by Telegraph" in the issue of the 7th inst. has elicited numerous communications. Probably the most interesting is one from Mr. Lowd, himself, which is as follows:

Office of Chief Dispatcher,
Northern Pacific Railroad Company,
Duluth, Sept. 13, '95.

J. F. Halloran, General Manager Mining and Scientific Press, San Francisco—Dear Sir: I was most agreeably surprised this noon at receiving copy of your issue of September 7th, and wish to thank you for the description and for the prominent place you gave it. I don't know where you got your information, but you did well by it.

The way I intend working it is to first put a picture on a chart and then write a cypher message from the chart, sending the cypher message the same as any other message and have it delivered as addressed. The person to whom sent has the duplicate sheets. He takes a sheet and the message and draws his lines from point to point, as indicated in the message. The operators do not see the charts at all, and only send the mixed-up mess of words and figures. The cypher message referred to in your issue only contains 463 words. Newspaper men know what *specials* of length cost. I can make a drawing on a chart from the cypher in less than 30 minutes' time, and I am not an artist. I only draw the lines from point to point. I've seen Mr. Willoughby's scheme, also some pictures in the *Call* of last spring, and also have read the telegraph account of the doings at Los Angeles, and came to conclusion that any artist, after reading the account of the affair, could have drawn the same or similar pictures; while in my scheme, if you notice the cypher, there is nothing except, perhaps, the last part that would lead any one to know what the drawing would be when finished. Again thanking you for the notice, I remain,

Yours truly, W. H. Lowd.

Regarding the source of information of which Mr. Lowd writes, the article was mainly compiled from one on the same subject in the issue of the *Electrical Review* of 13 Park Row, New York, of date August 21st, to which journal credit is due in the matter.

Critical Periods in the History of the Earth.*

NUMBER IV.

By JOSEPH LE CONTE, of the University of California.

II. THE POST-CRETACEOUS OR ROCKY MOUNTAIN REVOLUTION.

The next in order, going backward, is that which separates the Mesozoic from the Cenozoic, or more definitely, the Cretaceous from the Eocene. The physical changes which occurred at this time in America are (1) the unification of the American continent by the final abolition of the great interior Cretaceous sea which previously divided the continent into two parts, and (2) the formation of the Colorado, the Uinta and Wahsatch mountains. In America this may therefore be called the Rocky Mountain Revolution. Similar and even greater movements seem to have occurred in other continents, for the unconformities are even greater there than in America.

Here again we have widespread crust oscillations accompanied hy (1) great changes in physical geography, shown by very geueral, almost universal, unconformity of Tertiary on Cretaceous or on still lower rocks in every part of the world. Only in a few places on the American continent, *e. g.*, in the plateau region and in California, is the stratification douhtfully continuous. (2) By rapid changes of life-forms even where the sedimentation is continuous. (3) The iutroduction of a new and higher dominant class—the Eutheria. (4) Wide migrations partly permitted by changes in physical geography, and partly enforced hy changes of climate; and consequent great and rapid changes in organic forms, partly by pressure of a new environment, partly by mingling of faunas and floras, and partly by necessary readjustment to a new and higher dominant class.

The apparent suddenness of the change in organic forms—for example, in this case the appearance of Eutheria—is the result partly of loss of record (unconformity of strata), but mainly, I believe, of migrations (unconformity of faunas and floras). This suddenness, however, has in this case heen probahly exaggerated. Until recently, after the Jurassic Metatheria, no mammals were known until the Tertiary. But then, without apparent transition, an entirely different and higher type suddenly appeared in great numbers. The discovery hy Marsh of mammals in the uppermost Cretaceous was therefore hailed as probably filling the great gap. But according to Marsh these are all of pure Mesozoic types, and therefore bring us no nearer the origin of the Tertiary mammals than before. Osborne, however, finds them distinctly transitional, *i. e.*, as nearly allied to the Puerco, lowest Tertiary, Eutheria, as they are to the Jurassic Metatheria.

In this revolution the geographical chauges were probahly much greater than in the glacial, although far less known. The life changes were also much greater, except for the effect of man in the latter. As the drift represents deposits during the Glacial, so the Laramie those during this revolution. The Cretaceous proper was before, the Tertiary after, the Laramie during the revolution. The time occupied in the change and represented by the Laramie formation was very much longer. The hreak in the record was much greater and more general, but yet not universal, as witness the continuity of strata in some parts of the west. Undoubtedly Eutheria or true mammals appeared first in Arctogæa, as this was the great field of extensive migrations and the battle-ground of species, and therefore the place of most rapid evolution. From thence they spread by migration everywhere except isolated Australia.

These two periods, viz., the post-Cretaceous and post-Tertiary, were undoubtedly periods of very great and widespread changes, probahly affecting nearly, if not quite, the whole surface of the earth. Now, have we anything at all comparahle to these in the intervening Tertiary? Surely not. They are therefore properly called revolutiouary periods, and should be made the lines of demarkation separating primary divisions of time.

Among the changes of climate, perhaps of many kinds which took place in the last or glacial revolution, we find the most conspicuous is that of extreme cold. Do we find any such in the post-Cretaceous revolution? According to Dana there are some evidences of a cooler climate than before or after, but the evidence is not clear nor is it probahle that the lowering of temperature was extreme.

III. THE POST-PALÆOZOIC OR APPALACHIAN REVOLUTION.

Going still back the next, and perhaps the most conspicuous of all, is that which separates the Palæozoic from the Mesozoic. If we call the Permian a transition or critical period, corresponding to the Laramie and the Glacial, there is good reason to believe that it was of much longer duration thau either of the others. The readjustments of the earth's crust were much greater and it was much longer time before the equilibrium was settled and the organic kingdom again in a prosperous condition. The unconformity in this case was still greater and more general, and the loss of record, therefore, greater. The change in life-forms was simply enormous—the greatest that has ever occurred in the history of the earth. In Arctogæa the unconformity is almost universal, though not everywhere on exactly the same horizon. In the southern hemisphere, iucluding India, Australia and South Africa, there is little or no unconformity, but none the less are the chauges of life-forms great and rapid at this time, doubtless by change of climate and by migrations of conquering Mesozoic forms from elsewhere.

The mountain monument of this great period of change in America is the Appalachian Range. It is therefore called by Dana the Appalachian Revolution. But everywhere it was a period of great changes, and many other mountains originated at this time.

Observe, again, that the time intervening between this and the post-Cretaceous or Rocky Mountain Revolution, viz., the Mesozoic, was a time of remarkahle quiet and wonderful prosperity of the organic kingdom. It is true that here in America and elsewhere there were important changes in physical geography and some mountain-making at the end of the Jurassic, hut these changes were far less general and therefore far less potent in determiuing changes in the organic kingdom.

Among the causes of change in organic forms, one of the most potent is oscillation of temperature. Now the most decided evidences of glaciation known in any period except the Glacial are found in the Permian, and that, too, in many widely separated regions. This is especially true of Australia and South Africa, where the glaciation seems to have heen severe and undoubtedly connected with the great elevation and enlargement of the Antarctic continent, already spoken of. We have in these facts a probable key to the origin of the great reptiles of the Mesozoic. May they not have come by migration from the southern hemisphere, which seems to have heen the home (Karoo beds) of the earliest and most generalized forms of reptiles, viz., the Theriodonts? It is not prohable, however, that there were at this time any such geueral ice-sheeted condition of middle latitude regions as existed in the Glacial period, hut that there were severé and general oscillatious of temperature there is hut little doubt.

IV. THE PRE-CAMBRIAN REVOLUTION.

Last in the order of mention, but first in the order of time, and, so far as physical changes are concerned, by far the greatest of all, is the pre-Cambrian revolution. The Palcozoic era, especially in America, was a time of quiet, of prosperity, and steady evolution. Chauges occurred, indeed, during this time, many and great, hut not to be compared either in greatness or in wideness to those preceding and succeeding. The revolution at an end, viz., the Appalachian was more conspicuous than that before, only hecause of the great abundance of life both hefore and after, and the completeness of the change between. It was therefore equally conspicuous in the life-system and rock-system. The pre-Camhrian revolution was even greater in the rock-system (for judging by the universal unconformity it was literally a continental period between two oceanic periods), but there cau hardly he said to have been any previous life-system with which to contrast that of the Paleozoic. It is not improbable that further study will reveal other important divisions, but the meageruess of our knowledge makes it unnecessary to dwell further on this.

Aré there any mountain ranges connected with this revolution? Probably there are. The Laurentide mountains of Canada and the Adirondacks of New York are probably examples, but most of such have been swept clean away by erosion aud only their fossil bones left iu the form of complexly folded structure of pre-Cambrian rocks.

These four revolutions, then, I would insist on as marking primary divisions of time. Important movements occur between these, but far less general, and therefore far less effective in changing organic forms, and therefore should form the basis of subordinate divisions only. Three of these great revolutionary periods are generally recognized, hut the fourth and last, viz., the glacial, is not usually recognized as such. On the contrary, I regard it as the type, as the hest proof of the fact of critical periods, and as throwing ahundant light on the true character of such periods, and especially on the causes of the enormous changes in organic forms, during such times. These four, then, are the great landmarks of time. All other and lesser divisions are more or less local. If we recognize the primary divisious, then these become the fixed points for correlating the lesser divisions, as is uow being so successfully done by the U. S. G. S. in its admirable series of correlation papers.

(To be Continued.)

*Bulletin No. 11, of the Department of Geology.

Try the Number 49.

Here is a conundrum that is perplexing all the mathematicians of Philadelphia and vicinity:

A woman took a basket of eggs to the city for sale. Upon being asked how many she had she replied: "If I take the eggs out of the basket two at a time I have one egg left. If I take them out three at a time I have one egg left. If I take them out four at a time I have one left. If I take them out six at a time I have one left, but if I take them out seven at a time I have none left in the basket." How many eggs had she in the hasket?

The only answers that have yet come in make the smallest number 301 and so on up to interminahle millions, but ohjection is made that no woman's hasket could hold so many eggs. Perhaps she prevaricated.—Boston Herald.

The Broken Hill Proprietary.

John Howell, the manager of the world's greatest silver mine, leaves this coast on the Monowai for Australia on the 23rd. He mined with success on this coast for thirty-five years, aud has ably managed the great property entrusted to his charge. In recent conversation with an *Examiner* reporter he said: "I was for thirty-five years a practical mining man in California, Nevada, Utah, Arizona and Montana, so that I served quite an apprenticeship in the business hefore becoming the general manager of the Broken Hill Proprietary mine in Australia. The mine was located ahout ten years ago. It is situated ahout 300 miles from Adelaide, New South Wales, in the uorthwest corner of that country. The lode is ahout two miles in length, and stands up ahove the level of the plains, at the highest point, ahout eighty feet. It is an immense surface outcropping of iron-manganese, carrying about 15 to 28 per cent of lead, and from four to twenty ounces of silver to the ton. At the time of the locatiou of the mine the best ore found was of too low grade to pay for working, but at a depth of sixty to seventy feet a much richer hody came in aud extended to a depth of 400 feet. At the latter depth we struck water and the ore changed to a dense refractory sulphide iu place of the oxidized ore we had been working. This sulphide contains a high percentage of zinc, which is difficult to handle, and as a consequence the mine has practically heen worked only down to the 400-foot level.

"In the uine years that the mine has been worked it has yielded over 70,000,000 ounces of silver and upwards of 300,000 tons of lead. For the past six years it has paid six million pounds sterling in dividends. In the first three years it paid about $500,000 a month in dividends, hut since the fall in the price of silver it has been paying about $250,000 a month. There are about 16,000 stockholders, half of them in England, and the majority of the remainder in Australia.

"Connected with the works is one of the largest metallurgical plants in the world. Twenty-four eighty-ton capacity smelting furnaces are in coutinual operation, and there is a large leaching and chloridizing plant, a sixty-stamp mill and a hnge concentrator. The company employs hetween 4000 and 5000 hands. The fleet of vessels in the employ of the company is very large, as there is a continuous arrival of vessels from Sydney with coal, from England with coke, and from Oregon with lumber. The output of the mines goes to England, China and India.

"The character of the ore we are now working will last about a couple of years longer. It will become exhausted, and then we shall have to depend on the sulphides, which are very difficult to work, hecause so much coal is required and fluxes must he used in large quantities. The ore must he taken to the seaboard, where both these necessaries can he most readily ohtained. I am now going to erect a plant, that is to say, a metallurgical works, at the seaboard, which will cost about $1,000,000, for the treatment of the Brokeu Hill ores and similar refractory ores of other Australian mines."

"Prospecting" and "Mining."

A "distinction and a difference" is made by the *Colliery Engineer and Metal Miner*, which, in the current issue of that excellent journal in an article on prospecting and mining, says:

"Prospecting" may roughly he defined as lookiug for precious metal we hope and helieve exists, but of whose actual presence we have no positive assurance. "Mining," on the other hand, is when we have actually found ore and are following aud developing it. Under this definition there are many kinds of prospecting. There is prospecting for mineral leads with pick and shovel and for placer gold with a gold pan and rocker. There is prospecting on a bigger scale hy diamond drills, such as are now puncturing the mountains above Leadville in search of the gold belt. It is prospecting on a gigantic scale when a large company, like one at work at Idaho Springs, drives a tunnel for five miles through the mountains in search of veins of gold, some of which they know to exist, and others they hope to find. It is prospecting still when, as in the present case, a company undertakes to work the gold-bearing sands of Clear Creek on a gigantic scale and with gigantic aud novel appliances. Instead of the miner's little ditch or sluice, they have constructed a flume a mile or more in length, twelve feet wide and eight feet deep to turn the course of the primeval torreut and carry its waters bodily on one side, so as to expose and lay hare an interval of a mile and more of the river bed for their operations. Instead of the miner's little pipe short tom or long

om and driblet of water, the latest invention, Allen's big stave pipe over three feet in diameter is brought to bear and has been laid down for a mile, while attached to it is another mile of black steel sixteen-inch pipe forking at the end to accommodate two giant nozzles with a pressure of 125 feet vertical head and a force like that of a cannon.

Mine Development the Basis of Wealth.

NUMBER II.

TO THE EDITOR:—When I penned article No. 1, published in the PRESS of August 31, 1895, I thought possibly I was substituting my pen for a stick in a hornet's nest, and I have not been altogether mistaken, judging from some of the letters I have received. Miners are very touchy respecting their rights, and no one knows that better than I do. At the same time I know they aim to be just, and I know further that the majority know I am right. They now hold claims on a very slight tenure, and what I want to see is their holding fewer, having more security, and more wealth in consequence, and at the same time giving others a chance in the field, to say nothing of the general good gained by more activity for labor. From one of these letters I extract as follows: "Mine development is naturally the basis of prosperity, yet you cannot expect owners of mines with small capital to develop unaided their property, and I must take exception to compelling poor men to sink 200 feet or tunnel 300 feet before they could be granted a title. This would work a decided injury to the poor man, and is manifestly unfair."

I do not see it in this light, as, according to present laws, before applying for a patent you have to *swear* to $500 worth of work having been done on the claim and besides pay from $300 to $700 before you can get your patent. Now wherein is my plan "manifestly unfair?" My plan puts the $300 to $700 into development instead of its going into the pockets of greedy office holders.

Another letter says: "Have read your article in the PRESS. What is a man to do who has a mine and no money to work it? This is still the question." There is a longer story for an answer to this than for which I should use your valuable space, but I will ask: What *should* a man do with a mine and no money to work it? Lay by it, and simply dream of its unknown wealth or show some spirit in some way for getting assistance? In my first article I gave one plan, and here I will say: Why is not co-operation of mining labor as desirable for helping the "poor man" out as in any class of industry? I will further answer this question by saying: Develop your mines by co-operative labor, if not by any other way, and then sell them. *Bear in mind that every fairly developed mine is salable at a price in correspondence with developed value.* Let every miner write this on his forehead and go to work developing his property.

One or two more quotations from letters and I will pass on to other matter. One says, speaking of a certain mine: "It has not been worked for from thirty-eight to forty years, it being in the hands of those who could not work it properly." Another writer says, speaking of another mine: "It has not been worked for the past thirty years." Is it not wonderful that men will hold any mine, which they assure you is "rich," for thirty and forty years, doing nothing comparatively? The extent of this general holding, from year to year, of seeming mines is a very great detriment to the progress of every mining community, and does not such confessions clearly prove the correctness of my position?

The fact is that our whole governmental system of mining laws want readjusting to bring mining up to the spirit of the times. In this connection, too, the matter of the miners' right to the mineral lands must be determined so solidly that there will be no mistaking it, for, between the agricultural claimant and the railroad, the vested rights of the miner are getting very frail; and here let me say that, without the most active attention, some fine morning the greater number will wake up and find even their yearly half-worked claims have been gobbled up by the railroad power, and let me call every miner's attention to the fact that the next California Miners' Convention, to convene in San Francisco on the 14th of October coming, should receive their most earnest consideration, as effective action must be taken or all is lost, and then will be enacted by the mining land organization of the powers that be what is to-day the work of the British South African Company, which secured from the English Government a territory in South Africa about equal to the mining sections of California, and now they require as a right to mine on the same a royalty of 25% of the gross product, so I am informed. That the railroad company sees this point, and is moving with its jesuitical slyness to this end, I doubt not, and also that they are not going to leave any stone unturned for securing title to the mineral lands within certain sections, the value of which gain could be estimated at more than a hundred million of dollars.

Miners want to bear in mind that one of the vital questions of the next convention is: Shall it be controlled by the railroad or will the miners prove true to their interests and be on hand to protect it? Not only should the miners of the State take a great interest in the coming convention, but every business man, as much will depend on the outcome. Some may say that mining is of but little consequence. Now, we can maintain our status as a State through our other varied products; but, while the financial world are such sticklers for gold, and have all other values based on it, why is it not the pursuit that should receive the greatest succor?

The mining patrimony of the whole Pacific coast must be cared for in the interest of the rising generations, for the time is coming, and that soon, when the whole labor element will be confronted with the greatest destroyer of comforts and prosperity for the many—the competition and cheap labor of the Orient. It is going to be impossible to stay it. We cannot or will not place barriers high or strong enough to keep it out when we take into consideration the servile, debasing, political drones who will sell their honor, their children's future and the dignity of their State for coin and position.

ALMARIN B. PAUL, M. E.

San Francisco, Cal., Sept. 16, 1895.

English Money for American Mines.

English investors are reported looking in a wholesale way to American gold mines. Their agents and experts are looking into the merits of nearly a hundred properties in this and adjacent States, their field of inquiry extending over into Mexico. Fortunes have been made in the South African mines during the last few years, and the English mind, excited by the pleasurable experience, is desirous of taking in the good things of the same sort in America. There is no "sucker" money afloat, and whatever investments are made will be the result of careful, thorough and painstaking investigation by the best-equipped experts that money can hire.

The matter is down to a strictly business basis. Our English cousin is not frightened off by big figures, but when millions are named he must be satisfied that there is a good profit ahead or he will not trade.

Hence it is that negotiations are proceeding slowly, but the drift is certainly this way, and in the course of a few months from $75,000,000 to $100,000,000 of British gold is reasonably certain to be transferred to American pockets in exchange for titles to mining properties.

British curiosity is also being directed to timber and coal properties in the United States, and English capitalists are considering several attractive propositions of that sort, some of them running into the tens of millions.

Since England stopped putting cash into America five years ago, a monstrous surplus has piled up in the banks and trust companies of the tight little island, despite the tremendous losses consequent upon collapses in Australia and South America and reactions in Africa, Central America and India. Banks are paying next to nothing for private funds, and they groan at the sight of incoming streams of eagles. London is a lake of money, bank full and running over.

It has been only within the last ninety days that the desire to invest has taken possession of the owners of the mighty treasure.

Is It Wise?

A great many miners are of the opinion that it would be cheaper to let the railroad secure title to mineral lands now in dispute and then buy them from the railroad. Is it wise to think so? Let us ask those who hold this opinion if they believe the railroad would sell them mining ground worth from $50 to $1000 an acre for $2.50 an acre. Here are a few cases which actually exist in this county, and we call the attention of those who believe it is better to let the railroad alone to these cases and ask their opinion:

1. A man has been working a mine for more than twenty-five years. He has very good ground, but never had it patented. The railroad has listed it. Is it wise for him to let them secure title and expect to buy it from them afterward? Will they sell it to him? If so, may they not get one of their tools to bid against him and thus raise the price?

2. A man has a valuable mining claim, but the land through which it must be worked has been listed by the railroad. Is it wise for him to allow the railroad to secure it? Will the railroad fail to ascertain its value? May the owner of the mine hope to escape being cinched?

3. A company has spent many thousands of dollars in running a bedrock tunnel and opening a valuable drift mine. After working for some time they find that the channel extends into adjoining land listed by the railroad. They try to buy it. Is it wise to presume the railroad will sell it for $2.50 an acre if they have it patented?

4. A man discovers a quartz ledge in the high Sierras where the snowfall is from fifteen to twenty feet, and lies on the ground from November to June. The ground is covered with thick chaparral and is so rough and steep that a bear can hardly make his way over it. The miner prospects his ledge, finds it a good one, and lays in a supply of provisions and thoroughly develops it. Satisfied of its value, he attempts to secure a title to it, when he finds the railroad has it listed for farming land. He goes to W. H. Mills to buy it. Mr. Mills inquires about the land, and finally asks $6 an acre for it. The miner, being poor, cannot pay that price and leaves. He goes back to see if he cannot do better. Mr. Mills has studied the value of the land for farming purposes in the mean time, and comes to the conclusion it is worth $12 an acre. The miner remonstrates, Mr. Mills becomes irritated, one word leads to another till Mr. Mills exclaims: "We'll know what it is worth and we'll get all it's worth, too." Suppose the railroad has a patent to the land, what could the miner do? Be cinched.

5. A friend of the above miner is told one day about the experience with the railroad. He knows of a location on an odd section that belongs to the railroad that prospects quite well, but his friend's experience discourages him. What is the use for him to put in years developing a claim, and then, when he has found it, be compelled to deliver it to the railroad or let some one buy it over his head?

These are true cases, and the words ascribed to Mr. Mills were spoken by him to a Placer county miner. We ask our sleepy mining friends if they think it wise to let the railroad obtain a patent to all the mineral land they have listed? If they are overbearing and grasping while the land is only listed, what will they be when they have grabbed all they can and have a patent to it?—Colfax Sentinel.

The Gold Boom in Africa.

American boom towns are ordinarily supposed to outdo the world in speculative advances, but nothing over here can compare with the appreciation which has taken place in African gold mine shares in London and Paris.

The Chartered Company of South Africa a year ago had an aggregate value of $20,000,000. To-day the holders of its stock find its aggregate value of current quotations to be $90,000,000. The De Beers Diamond Company has moved in a year from a total valuation of $60,000,000 to one of $100,000,000. The mines in the Witwatersrand district alone have risen in about seventeen months—from March, 1894, to August, 1895—from a quoted value of $80,000,000 to a quoted value of $424,000,000—over five-fold. In addition to the original companies included, "blind pools" have been formed to deal in the shares of these companies, and the stock of a single one of these—the Consolidated Investment Company—has risen from a nominal capital a year ago of $3,250,000 to quotations which make the shares worth to-day in the aggregate $21,250,000. A few weeks ago the Robinson South African Banking Company started with $15,000,000 nominal capital. The quotations have been rushed up to an aggregate of $41,250,000, and yet no report has been made as to the assets of this company. The Consolidated Investment Company has declared a 20 per cent dividend in six months, but no one knows out of what mines or properties its "investments" have been "consolidated."

In all the advances in these securities, based on a territory about as large as California, still unsettled, at a long distance from the seacoast, inhabited by savages, and with unknown difficulties in the way of its development, have reached in the London market $500,000,000. In 1890 the entire valuation of California after forty years of settlement was only $1,100,000,000. California is larger in area than this African gold region. It is more fertile and more accessible. It has a seacoast and a population of 1,500,000. It is now producing half as much gold as this African region, while in the past it has produced more than any sober estimate of the future African product, yet the paper profit of these boom companies in the past year and a half is nearly half as large as the total valuation of California.

A boom like this can only have one end. These "profits" of $500,000,000 will vanish. The speculation has been extraordinarily successful because these gold mine shares have sold in France. They have been bought in small lots on a scale so great that last May the transfer facilities were deadlocked for days and shares were not delivered until weeks after they had been purchased. French small holders are always tenacious. They buy to keep. This has supported speculation, and as early as issues were removed by their purchases new companies have been organized.

The British South African Company, which conquered the region last year, is at the bottom of this speculative craze. It has sold mining and other rights. These have been capitalized, subsidiary companies organized and a new set of shares sold. Lastly there are "investment" companies which deal in the shares of these various corporations and create a new capitalization. This inflated bubble has been preferred by English and French investors to American securities. Ten years ago the same investors were preferring Argentine and Australian securities to ours. Another great crash in England cannot be far distant. The last brought down Barings. Who can tell what this wilder speculation will sweep away?

Mining Summary.

CALIFORNIA.

Amador.

MASSA.—*Republican:* D. Gutman, who has a bond on this property, is sinking a prospect shaft. The mine is on the Massa place at Jackson Gate. It is the east vein of the mother lode, a continuation of the ledge found in the White and Bellweather mines on the south. The shaft has reached a depth of 40 feet. It is the intention to sink on the ledge for a distance of several hundred feet, and ascertain the quality of the ore at that depth. It is a question of quality, not quantity. There is plenty of rock, of low grade, the only point to be determined is whether it carries gold in sufficient quantity to pay. To settle that problem is the object of the present undertaking. If it proves of a paying character, the enterprise will be freighted with bigger results for Jackson than any mining enterprise that has been inaugurated here since the rehabilitation of the Zeile fifteen years ago.

ARGONAUT.—This company is steadily pushing the sinking of its shaft. The foundation of the air compressor is completed. A tunnel is being driven from the Volunteer ground west to tap the Argonaut shaft at a depth of about 200 feet. The tunnel was commenced many years ago, and run a distance of 100 feet. The work at present consists in clearing out this tunnel.

THE KENNEDY.—The Kennedy mine has been troubled for some weeks by an increased flow of water in the north shaft coming from the upper levels. Two small reservoirs have been constructed near the shaft, and the impression was that these were responsible for the increased water supply. To prove the matter, these reservoirs were emptied, and since then there has been a noticeable decrease of the water.

AMADOR QUEEN.—The shaft at the Amador Queen has been cleaned out to the bottom. The test crushing will be made as soon as the ore can be taken out. The company has been operating ou as economical basis as possible, but still has been put to considerable outlay thus far. About 30,000 feet of lumber from Whitmore's mill has been used at the mine in constructing buildings, ore bins, etc.

Calaveras.

RAILROAD FLAT.—E. H. Schaeffle of Murphys has sold the Keystone mine to E. C. Loftus of Sonora, who is grading for a mill and will put the old mine in good working order. The Keystone has been worked aloug the surface for many years for a continuous distance of about 900 feet. For want of a hoist the owners did not go below a depth easily worked by a windlass. During all these years the vein has given a value in free-milling ore of from $30 to $45 a ton. In the deepest shaft the ore carries a good per cent of sulphurets, which will now be saved.

A BIG BLAST.—Eleven hundred pounds of powder was fired by electricity on the 11th, in the uuderground passages made by the miners in the Central Hill gravel mine, near Murphys. Since the last of June a few miners were engaged in running tunnels, and side drifts to distribute a sufficient quantity of powder to thoroughly shake up a large area of gravel to facilitate its removal when piping is resumed next winter. Those who were present heard but a faint report when the electrical current accomplished its mission, saw the earth rise about three feet and settle, and the work was well done. Fissures and openings characterized the hitherto formidable bank, and when work is again commenced the moving of the gravel will be greatly accelerated.

GENERAL NOTES.—*Echo:* It is stated upon good authority that the Rasberry claim, situated on the Dead Horse lode in this town, has been sold for $15,000.

Parties interested in the purchase of the Pure Quill mine, have arrived in Angels Camp and are preparing to open the mine up in proper shape.

The Calaveras Consolidated gold mine, situated at Robinson's Ferry, has heen purchased by Mr. E. K. Stevenot, the locator and former owner thereof. Mr. Stevenot intends opening up the mine in a short time, in fact, is making preparations for that purpose now.

Jas. Deitrick, who has the Bald Hill mine, at Albany Flat, in charge, has put men to work freeing the mine of water. As soon as the water is taken out, the work of sinking the shaft will be commenced.

Mono.

THE SOUTHEND CYANIDE. — Bodie *Miner:* The Booker Flat Cyanide Plaut has commenced operations. It has a daily capacity of 150 tons of tailiugs. It consists of six leaching tanks, 20 feet in diameter, and seven feet high, two storage tanks of the same dimeusions, two water and stock solution tanks, sixteen feet in diameter and ten feet high, two tauks 5x6 feet, and four sluice boxes.

A special feature of the plaut is the method of charging the tanks, which originated with the owners. In order to obviate rehandling the tailings, it is so arraiged that teams pass over the tanks, on platforms, and the wagons are quickly emptied iuto the tanks, through movable griddles.

The system of leaching the tailiugs is very complete, and not a drop of solutiou is lost except what is carried away as moisture with the tailings after they have been leached.

This plant is owned by J. S. Cain, A. Soderling, J. W. Kelley, C. C. Radcliffe of Bodie, and A. J. McCoue of Virgiuia, Nev., and is managed by R. Recknagel who also manages the plant at the Bodie Tunnel Mill.

Nevada.

WILL OPEN UP THE TIP TOP.—*Union:* Negotiations are pending for the sale of the Tip Top property, adjoining the West Harmony. The mine will be worked through the West Harmony shaft. The ground is supposed to be good and the company that will work it will fully develop the mine. The plant at the West Harmony goes in the bargain, it being owned by the Stow estate. This is good news for Nevada City.

THE CROWN POINT.—*Tidings:* The Crown Point mine is bonded for $50,000, by a syndicate in Paris, a representative of the capitalists interested left Paris on the 14th inst., with the purpose of coming directly to Grass Valley in order to make a payment on account, and to start work on the mine. The entire purchase price must be paid within one year.

The negotiations leading to this deal were carried on hy use of the telegraph and ocean cable. Several years ago the Crown Point was thought to he sold in Paris for a large amount of money. At that time maps and samples of ore from the mine were taken to the French capital, and from the showing then made it was decided to purchase. On the eve of closing the bargain, the Panama Canal scheme exploded and investors were at once made shy of foreign propositions and the deal fell through. One or more of these original investors has retained an interest in the Crown Point purchase. By use of the maps and samples still on the field, this late deal has been brought about.

The Crown Point is undoubtedly a good property. A. Gauthier, the owner, has taken at least $130,000 out of the mine. Of late years it has been comparatively idle. The machinery is uot sufficiently heavy to work the mine at any considerable depth. Recently a drift has been run out from the air-shaft ou the 200-foot level, and a fine body of ore was encountered. With capital to replace the present light machinery, and to prosecute some development work, the Crown Poiut will be all right, even should the present deal fall through. The latter contingency, however, is not now deemed probable.

W. Y. O. D. ANNUAL MEETING.—The annual meeting of the W. Y. O. D. Mining Company was held this week, and the following were elected as the hoard of directors: J. R. K. Nuttall, Joseph Weissbein, Jacob Weisshein, Louis B. Parrott, P. T. Simonds. The board organized by electing the following officers: J. R. K. Nuttall, president; Joseph Weissbein, vice president and manager; Jacob Weissbein, secretary; Weissbein Bros. & Co., bankers, treasurer; Thomas H. Simmonds, superintendent.

Placer.

THE GRAY EAGLE.—*Argus:* Gravel paying $10 a carload has been struck in the Gray Eagle mine at Spring Garden. The significance of this development will be appreciated by all miners interested on the Forest Hill divide. For seven years the Gray Eagle Mining Company has been pluckily spending large sums of money in sinking a shaft 400 feet through the cement, and then when that failed of making the expected discovery a still larger sum has been expended in runniug a tunnel in the face of which, 600 feet underground, the strike has finally been made which will turn back the golden stream. Below the Dardanelles mine there has been knowu to be seven miles of channel, undoubtedly rich, hut so deeply huried that it has balked the efforts of many mining companies to find it. The Gray Eagle discovery locates this channel and at the same time proves its value. Other companies will now be encouraged to go ahead to develop this channel, thus adding materially to the gold product of this county for years to come and providing work for many miners. There is every reason to believe the channel to be the same as that mined in the Breece & Wheeler and Mayflower, and that it will repeat the phenomenal yield of those mines.

The Gray Eagle Company is a San Francisco corporation of which H. W. Gray is the president and T. G. Durning superintendent.

EUREKA CON.—*Sentinel:* One of the most extensive mines on the Forest Hill divide, is the Eureka Consolidated gravel mine, which embraces 3600 acres of land and extends over six and one-half miles of channel. The mine is owned principally by Felix Chappellet; W. H. Bailey, of Oakland, is also a large shareholder. Mr. Chappellet began buyiug up the property some fifteen years ago satisfied it was a good thing. The chanuel is supposed to be the same as the one worked in the Greek mine east of it and in the Dix mine west of it. The gravel sought after is the deep or blue channel although a great deal of the white or upper channel is known to exist in the holding. The company has already driven in one tunnel through the bedrock 1500 feet and tapped the channel. This tunnel proved too high although it crossed a bed of gravel 400 feet wide. Another tunnel, known as the Clara, was run into the hill about 210 feet but has since been abandoned and another has been started about 400 feet lower ou the same side of El Dorado canyon. It is expected that the channel will he tapped after running about 1800 feet through bedrock. Work is in progress for the erection of a building for the boiler, compressor and blacksmith shop. This building will he about 30x65 feet, built near the mouth of the tunnel and connected with it by sheds to protect the track from snow. A road has just been graded from the top of the ridge to a point just above the tuunel for the purpose of getting in the machinery.

In addition to other improvements the company has fitted up about a mile of the old Breece & Wheeler water ditch which carries water from El Dorado canyou, thus furnishing the mine with an ample supply of water power. The company's land is covered with much valuable timber and it is the intention next year to put in a small portable sawmill to supply the mine with timbers, etc.

The tuunel will he run large enough to allow a small engine for hauling the cars. The mouth of the tunnel is situated about 2½ miles east of the Red Point mine and at an elevation of 3914 feet above sea level, being over 800 feet lower than the main divide.

About twenty-one men are at present employed. Felix Chappellet, Jr. is superintendent.

Riverside.

GENERAL NOTES.—*Record:* The Alice mine and mill has started again. About eight tons of ore are being crushed daily. The ore being worked is sulphuret in character and runs about $75 to the ton, the proportion being about ten to one. Enough free gold is taken from the ore to pay expenses.

The Menifee mine is now shut down. A deal is now on by which the property will in ahout a month pass iuto the hands of a Boston company.

The Good Hope started up this week after being shut down for a few days, pending repairs in the mine. The mine and mill now employ between thirty-five and forty men.

The newly organized Leon Mine and Milling Company will work the Briggs mine and extensions. The Briggs will soon resume active operation.

San Bernardino.

GENERAL NOTES. — At Blackburn station Miller & Cram are shipping ore that nets $140 per ton after paying freight and milling.

At Vanderbilt mine owners are waiting for the extension of the California and Eastern railroad, when they will be able to handle ores more cheaply. The Campbell mine is being operated on ores taken from tbe St. George and Boomerang claims. The last cleauup from fourteen days' run produced $4200. There are twenty men at work about the mill and taking out ore from these two mines.

The Gold Bronze mine is now in the hands of Receiver W. N. Crandall. The stockholders of the company had run behind about $20,000 in the last year and a half; under the management of Mr. Crandall the mine is beginning to pay and the receiver is hopeful of being able to pay off all the debts from proceeds of the miue. The Gold Bronze is opened up to a depth of 250 feet, with fifty-foot levels extending 150 feet east and west from the main shaft.

Siskiyou.

AT HAWKINSVILLE.—*Journal:* Lambert and Morley intend running a 200-foot tunnel into the Aurora and Blessing quartz ledges on Canal Gulch, iu Hawkinsville mining district, to develop the same, with an option of $10,000 for the locations, if they turn ont as anticipated.

The Portuguese employed in the Espey, Hunter & Co. mine at Hawkinsville, struck for higher pay last week, or from $2 to $2.25 per day. A new crew of Americans has been employed, and the work continues as before.

NEVADA.

ON THE COMSTOCK.—Dan De Quille in Salt Lake *Tribune:* In the Confidence and Challenge mines at Gold Hill has been found a six-foot streak of ore that will pay about $40 a ton, nearly all in gold. In following this streak north it is found to widen. It may presently expand into a bouanza of considerable size.

Con. Cal. & Virginia is still yielding fairly well. They last week shipped to the Morgan mill on the Carson river 105 tons that averaged $51.05; the Hale & Norcross extracted 41 cars of ore that assayed $50.46 a ton; the Potosi people are repairing the main thoroughfares of their mine, and extracted but 54 tons of ore, assaying $29.42 a ton. At the Chollar mine two small streaks are being followed and prospected. One of these streaks of ore is on the 450 and the other on the 650 level. The streaks are expected to lead to ore bodies. During the week they yielded 25 tons of ore assaying $26.79 a ton. The Occidental is following a two-foot streak of ore on the 550 level that assays from $5 to $25. At the Crown Point all underground work has been suspended to await a milling stage of water in the Carson river. Most other companies are utilizing the season of low water hy making repairs. The Morgan mill ean be run, as it is provided with steam power for use during the dry season. The Carson river is now so low that no water runs over the dams.

The Kinkead Mining and Milling Company have commenced operations on the Con. Cal. & Virginia waste dump. They are getting about 65 tons of ore a day. A mill for working the material ohtained will be built at once.

AT THE BRUNSWICK. — All is progressing favorably in the development work started some weeks ago on the Brunswick lode by several leading companies of the main Comstock. Work is being done at those different points and is pushed day and night. Water-pipes are being laid from the city to the lode, which is ahout a mile east of the main Comstock, and is the most easterly vein of the Comstock system of quartz leads, and hoisting-works will at once be erected at the inclines. Prospecting work is also being done on the north and south extensions of the lode by individual owners of ground in those directions. Some of these fiud the vein strong, and claim to be ohtaining godd prospects.

AT SILVER CITY.—At Silver City the majority of the miners are doing well. Pedroli is taking out ore that averages $150 a ton. He has at least $20,000 in sight in his mine. His last clean-up amounted to $10,000, and his next will give him not less than $15,000. To obtain $1 iu gold costs him less than 25 cents. All the Silver City boys who are "in honanza" are making good wages.

The Oest mine is paying well. At the depth of 200 feet a heavy flow of water was encountered some years ago. The ore was very rich, hut instead of trying to go deeper the owners worked north and south and upward on the vein. Meantime the combination tunnel was heing run. This tunnel has been resumed and is heing carried down below the old water level in fine ore.

COMO COMING UP.—At last the mines of Como are to be prospected at depth. A company has been formed, with Col. Ed Boyle, the well known superintendent of the Alta, at the head as manager, to run a long drain tunnel under a promising section of the vein system. Work has already been commenced on this tunnel. It will reach the North Rapidan lode in going 900 feet. It will then be run in the lode a distance of 1600 feet to the Rapidan shaft. It is expected that paying ore will be found in following the vein. The tunnel will drain the ground to the depth of 600 feet. The company have secured the control of several large veins. Most of those concerned in the enterprise are Englishmen.

OUTSIDE GOLD CAMPS.—Reports from Silver Star continue favorahle. At the Gem mine Gen. Harrington has cut into another deposit of specimen quartz. Forty pounds of the ore yielded $1300 when pounded out in a mortar. It has been discovered that the surface dirt over the vein is full of gold. They have sacked several tons of it and sent it to a mill in order to find out what it will work. All the other mines that are in ore are getting big pay. Men who a few weeks ago secured leases on veins are now selling interests in the same at good prices.

At Silver Peak a mill of sufficient capacity to crush 60 tons of ore a day has been started up. It will use a leaching process.

At Austin the mill of the Austin Mining Company is regularly at work. A force of 70 men is employed. A fine concentrating plant is in operation.

In Union district, Nye county, a five-stamp mill has been started up. Tbe free gold is amalgamated ou plates and concentrates are saved for shipping.

Prospectors, searching for gold, are pushing down into tbe Death valley country.

NYE COUNTY.

UNION DISTRICT.—The prospects near Ione are reported to be flattering. A party of Eastern capitalists have bonded several mines in the vicinity of Ione, which will be operated by them. Although the ore is of a medium grade, the conditions of the district will make mining on a large scale profitable, wood and water being plentiful.

OREGON.

PLANT FOR THE CORNUCOPIA.—*Tribune:* The machinery for the uew twenty-stamp mill on the Cornucopia mine, near Baker City, Or., is rapidly being placed in position, and, it is expected, will be in operation by October 15th. Frazer & Chalmers are furnishing the machinery, and a represeutative of that company is now on the ground. The plant will also be arranged for the chlorination of ores.

THE ASHLAND MINE.—Thos. James, who has had charge of the recent work, brought to the Selby Smelting and Lead Co. last week 23 tons 600 pounds of ore for reduction. The ore yielded $133 per ton. The gross returns of the 23 tons 600 pounds amounted to $3000. The cost of production was $600. This ore was the product of the work of four men for thirty-two days. Work has been resumed at the mine.

GENERAL NOTES. — Superintendent Geiser, of the Bonanza mine, arrived in Baker City, last Wednesday, with 300 ounces in gold, or $4800, the output of the Bonanza mine for two weeks. August 21st last, Superintendent Geiser brought in $5000, the result of two weeks' cleanup.

The *American Banker* of September 4th, a paper published in New York, contains the following: "Horace L. Hotchkiss & Co., have sold a gold mine property located at Quartzville, Linn county, Oregon, on a basis of valuation of £100,000. That means $500,000 for the mines now being developed under the management of W. B. Lawler."

In southern Oregon, the Grant's Pass *Courier* notes in course of construction a mile and a half ditch to tap Gunnry & Speneer's placer on Jones creek, a mile ditch in Galice district; a 16-mile ditch for the Illinois Mining Company; a supply ditch on the Clark placer on Grave creek; a five-mile ditch on the upper Grave creek for the Hampton mine. It also notes that a five-stamp mill will be erected on the Suprise lode on Dry diggings, and a big excitement at the Steamboat mine, 13 miles above Williams, in consequence of the old tailings assaying $800 to the ton. A seam of rich ore ahout an inch and a half thick accompanies a "hlanket ledge" for several hundred feet, and this seam assays over $1000 to the ton. An assay was made last week on some concentrates which figured up $103,000 to the ton.

JOSEPHINE COUNTY.

A COPPER MINE.—W. S. Elmer, of Baltimore, Md., is in this city, on his way home from a visit to the Siskiyou Copper Mining Company, now operating in Josephine county, 32 miles southwest of Grant's Pass, of which he is president.

The company owns twenty-one claims. A mountain road, 12 miles in length is finished, and a smelting plant, twenty tons capacity, is being erected. On the claims prospecting work is heing carried on, and a series of tunnels run to learn the real extent of the ore body. The assay value of the rock ranges from twenty-six to sixty per cent copper, with a showing of gold, and it is anticipated that copper will be shipped before snow flies.

About 100 men are at work on the new Hampton ditch on Upper Grave creek. The aqueduct is to he five miles long, seven feet wide at top, four feet at hottom, and three feet deep. The wages paid men vary from $1 a day to $2.50 and board.

BRITISH COLUMBIA.

GENERAL NOTES.—Ashcroft *Journal:* The O. K. Mining Company has refused $10,000 for its mining property at Stanley.

J. B. McCorkle of Chicago will soon recommend Chicago capitalists to spend $50,000 on a dredging plant on the Quesnelle river, seventeen miles from Quesnelle.

Charles F. Fishhack of Seattle has purchased tbe property of the Quesnelle Mining

and Dredging Syndicate, and will work the rights by an entirely new process.

Midway *Advance:* Work has been resumed on the 200-foot shaft the Boston-Butte Company is to sink upon the Cariboo, Camp McKinney. The purchase is not yet complete.

A strike has been make at Baker creek, three miles from Anarchist mountain. The ledges are from 40 to 50 feet in width. It is supposed to be a continuation of the Trail creek ore.

Final arrangements have been made for the building of a 50-ton smeltor at Midway by S. S. Fowler of Chicago and W. T. Thompson of Fairview.

New Denver *Ledge:* Twenty tons of ore will be shipped from the Cordella. It assays 211 ounces in silver.

Tunneling, preparatory to shipping ore from the Slocan Queen, was started last Monday.

There will be considerable ore shipped from the Springer and Ten Mile creek districts this winter.

A concentrator is at present turning out a carload of Alamo concentrates daily, averaging about 125 ounces.

About 45 feet of shafting has been sunk on the Currie claim on the Galena Farm. There is about 30 tons of shipping ore on the dump and over 100 tons of concentrating ore is now ready for shipment.

Nelson *Tribune and Miner:* Wages for shovelers at the Silver King have been reduced from $2.50 to $2. Only three men continued work.

I. Williams, who has been foreman on the Slocan Star, has resigned to manage the North Star, Fort Steele, owned by Mann and Holt, of Montreal. A $20 rate has been obtained to the smelter and the ore runs $50.

The four and a half tons of ore from the Fern, on Hall creek, 12 miles south of Nelson, has been run through the Poorman mill, and the yield was about $100 a ton in free gold saved, and the sulphurets assay over $600 a ton.

Rossland *Miner:* The Le Roi has 97 men at work.

The Homestake ore assays $50 in value.

F. A. Heinze will have a controlling interest in the Trail creek smelter, which will handle 100 tons of ore per day. The site has been cleared and the new works will be ready by November 1st.

A ledge assaying $36.05 in gold, 82.5 ounces silver; another sample $7.70 in gold, 149 2-5 ounces silver, and the third $3.65 in gold and 54.5 ounces silver, is reported to have been struck on Springer creek.

ALASKA.

THE BEAR'S NEST MINE.—Testimony is being taken at Portland, Or., before United States Commissioner Sladen in the case of A. G. Renshaw against the former owners of the Bear's Nest mine. Renshaw charges that the sale of the Bear's Nest group of mines, on Douglass Island, Alaska, was accompanied by fraud, and accuses the defendants of conspiring to make the sale by placing gold-bearing rock from the rich Treadwell mine in the barren mine adjoining, and by fraudulently treating the core from a hole bored by a diamond drill to make a showing of rich ore.

R. M. Breereton, the third expert sent out from England to examine the Bear's Nest group of mines, I. B. Hammond, J. S. Laidlaw, who was a resident of Douglass Island and employed in the mines there while the sale of the Bear's Nest was being effected, William Stitt, Portland, and F. O. Downing, who was one of the stockholders of the Bear's Nest mine, are among those whose testimony is to be taken.

A DIFFICULT COUNTRY. — In parts of the interior and northern Alaska the miners have to contend with underground ice, which in placer work is as bad as meeting rock. The ground is not merely frozen but consists in parts of layers of ice alternating with sand and clay, having the granular texture of glacial ice. The remains of mammoths, etc., are found in the clay overlying the ancient ice masses.

SOUTH DAKOTA.

THE HOMESTAKE COMPANY.—The Homestake Company of the Black Hills have decided to add forty more stamps to the Golden Star mill, thus making an even two hundred. A new Corliss engine of 500 horse power will replace the one recently wrecked. The improvements will require between three and four months to complete; but when the mill again starts up, more men will be employed in the mines connected with it, as it will require about 800 tons of ore per day to keep it in operation.

WYOMING.

THE FORTUNATUS M. & M. CO.—The Fortunatus Mining and Milling Company, which has been working claims at Bald mountain, near Sheridan, has at last struck gold in paying quantities. The general manager of the mines, who has just returned to Sheridan, says: "All our stamp mills are now running, and the conglomerate is averaging from $8 to $20 a ton of pure gold. We have thirty stamps at work running night and day. I have telegraphed an order for more stamps."

IDAHO.

THE CŒUR D'ALENES.

TIGER AND POORMAN.—F. R. Culbertson, the general manager of the consolidated Tiger and Poorman properties says: "The Poorman is closed down and it is not likely that work will be resumed for some time. In course of a few weeks we expect to close down the Tiger for awhile. A number of changes will be made and it is very improbable that any extensive mining operations will be resumed on the consolidated properties before spring.

"The Poorman hoist will most likely be moved into the Tiger mine to replace the present Tiger hoist. Some water wheels will be added so as to utilize the Tiger water power. This will result in the abandonment of the Poorman shaft. The pumps of the Poorman will also be moved to the Tiger as fast as we have occasion to use them. At this time the only work being done on the Poorman is pumping water, and this work will be turned over to the Tigor within the next week or ten days. The pump recently put into the 900-foot level of the Tiger has a capacity of 600 gallons per minute, and can easily handle the water for the two mines. A tramway will be built from the Tiger shaft over to the Poormau mill, and some changes will be made in the Poormnn concentrator."

COLORADO.

IDAHO SPRINGS.—*Mail:* The Gulf road reports handling 179 cars of ore outbound from Idaho Springs for the month of August, compared with but 84 cars for the same month last year. This is an increase of more than double within one year. The mills in Idaho Springs have a combined daily capacity for treating 555 tons of ore. A careful estimate for the month of August shows the output of lower Clear Crock at $200,000. The outlook for September is even more encouraging.

A new fifty-ton concentrating mill is about to be erected at Idaho Springs by the Denver Public Sampling Works.

NEW MEXICO.

HANOVER.—Silverton *Enterprise:* Since the advent of the new Mexico and Arizona Smelting Company, and the opening of the company's copper matteing furnace, Hanover is improving. The smelter is running steadily and shipped two cars of matte during the past week, with nearly another car ready for shipment. Forty-two teams are employed hauling ores from the various camps to the smelter. The Home Ticket and Two Jacks mines, at Lone Mountain, owned by Hon. Richard Hudson and Jack Frost, are shipping steadily to the smelter. Several hundred tons of the waste dumps of these mines are being shipped at a good profit.

Fifteen to twenty men are busy at work opening up the long idle mines of Lone Mountain. Some very rich ores are being discovered, but the large bodies of low grade ores can be handled at a profit as the limestone gangue serves as the necessary flux at the smelter. The miners are netting from $6 to $10 per ton from their old waste dumps.

ARIZONA.

THE MINERAL HILL GROUP.—Tucson *Citizen:* The Mineral Hill group of mines in the Sierritas are pushing forward as ore producers. About eighteen men are at work on the property and ten to twelve teams are constantly engaged in hauling ore to the smelter.

A LIVE CAMP.—The Congress Mining and Milling Company now employ nearly 300 men in their mine and mill. They crush about 100 tons of ore per day. There is also an output of twenty tons per day of shipping ore. A cyanide plant below the mill handles over 100 tons of tailings per day, from which $9 a ton is extracted.

The company is replacing their electric light plant with a larger one, so that they can light their mines and a large new mill they are preparing to build, which will be worked in conjunction with the old one. It will be the Cornish rolls and will handle 300 tons more ore a day. It will be the cyanide process and they will work what is known as the large vein or Congress proper. The mine consists of two streaks of ore in the same vein. The small vein on the foot wall is four feet on the surface, but as depth was attained large bodies of ore were encountered. They are in 1500 feet on this ledge, which is larger and richer on the bottom than anywhere near the surface. The ledge is 100 feet above this and crops out 12 to 15 feet on top. This ledge has only been worked to develop it and prove its value, and three crosscuts are being driven deep down—one from the bottom of the small vein, which will cut it 1600 feet from the surface.

The Planet-Saturn people, of Fools Gulch, are making preparations for work on an extensive scale. Grading is being done for boarding houses, hoisting works, etc.

GENERAL NOTES.—Owing to the recent rise in the price of copper, the Copper Queen Co., at Bisbee, has restored wages to the rates prevalent before the panic.

The Coarse Gold mine, formerly known as the Mexican mine, near Wickenburg, is again turning out many gold nuggets from its thirty foot quartz ledge.

Davis, Wetmore & Co., of Montana, have purchased the Old Figueroa gold mine at Potboles, twelve miles above Yuma, for $36,000, upon which they will erect a ten-stamp mill.

In the Cerbat district, Mohave county, Charles Gross and his partner Canias, are taking ore from the Gold Bar mine that will go $2,000 to the ton and are running their arrastra.

YAVAPAI COUNTY.

At Chaparral the trestle from the tunnel to the mill is completed. When the tunnel through the mountain on the other side is finished, the ore will be carried in cars which will run by gravity into the mill, and dumped into the new ore bins and from there to the battery, making a saving of $1200 per month.

Total Coinage for August.

The coinage executed at the mints of the United States, during the month of August, was as follows:

Denomination—	Pieces.	Value.
Double Eagles	94,000	$1,880,000
Eagles	23,000	230,000
Half-Eagles	312,440	1,562,200
Total Gold	429,440	$3,672,200
Half-Dollars	500,000	$ 250,000
Quarter-Dollars	1,912,000	478,000
Dimes	200,000	20,000
Total Silver	2,612,000	$ 748,000
Five Cents	1,756,000	$ 87,800
One Cent	960,000	9,600
Total Minor	2,716,000	$ 97,400
Total Coinage	5,757,440	$4,517,600

Books Received.

"Fourteenth Annual Report of the United States Geological Survey, 1892-93," by J. W. Powell, 8vo., two parts.

Part I is devoted to the report of the director and his assistants, expense accounts, etc. Part II is a handsomely illustrated volume of papers on the geological features of different parts of the country. Of local interest are the one on "Tertiary Revolution in the Topography of the Pacific Coast, by J. S. Diller, and "The Rocks of the Sierra Nevada," by H. W. Turner. In treating of the topography of the Pacific coast the first paper takes up the term "Klamath Mountains" as a distinct term. The name "Klamath Mountains" is not yet in general use and requires explanation. In northwestern California and southwestern Oregon, where the Sierra Nevada, Cascade and Coast ranges meet, there is an irregular group of mountains, extending from the fortieth to near the forty-fourth parallel, N. L., for which there is no general name. The various ridges and peaks of the group, including the Yallo Bally, Bully Choop, South Fork, Trinity, McCloud, Marble, Scott and Salmon mountains in California, as well as the Siskiyou, Rogue River and others in Oregon, have all been specially designated. Investigation has shown that the geological history of this group has been essentially the same throughout, and that there is need of a general name for the whole group. For this purpose it is proposed to use the name "Klamath Mountains," using the name of the river, which, in a deep canyon, cuts directly across the group from the interior platform and the Cascade range to the ocean. The geological structure of this region is given extended description, showing that during the Cretacious period the land in that region extended westward to the continental border, ten to thirty miles beyond the present coast line into the Pacific.

The second paper, discussing "The Rocks of the Sierra Nevada," takes up the geology of that extensive system, the treatise containing an interesting dissertation on the formation of the ancient river channels and their present lava caps. The report is of great practical value, and will receive subsequent notice at greater length.

"Proceedings of the Third Annual Meeting of the Lake Superior Mining Institute."

This includes an account of the meeting, a paper on the "Iron Ranges of Minnesota," by H. V. Winchell, an address by the retiring president, J. P. Channing, "Distribution of Phosphorus and System of Sampling at Pewabic Mine, Mich.," by E. F. Brown; "Efficiencies of Some of the Pumping Plants on the Menominee Range," by Per Larsson; "The New Pumping Plant of the Stirling Iron and Zinc Co., N. J., "The Hoisting Plant of the Lake Mine, Cleveland Iron Mining Co.," by J. M. Vickers; "The Relation of the Vein at the Central Mine, Keweenaw Point, to the Kearsarge Conglomerate," by L. L. Hubbard; "Open-pit Mining, with Special Reference to the Mesabi Range," by F. W. Denton; and a communication upon the cost of crushing hard hematite.

"Annual Report of the Secretary for Mines, Victoria, for 1894:" Robt. S. Brand, Government Printer, Melbourne; price, five shillings.

The first part is a report by Secretary A. W. Howitt, dated May 29, '95, of the general condition of the mining industry, reports from the government geologist, palæontologist, board of examiners, and mining inspectors. The second part is an illustrated description of the latest improved mining machinery, compiled largely from American mining and scientific journals. The third part is a report on diamond drills and drilling, with incidental descriptions of the several mining districts. Part IV is composed of statistics, from which it is learned that the total yield of gold in the colony of Victoria for the year ending December 31st, '94 was 673,680 ounces. Each district's yield is subdivided, and the returns minutely made, the same as from the different counties of this State for '94, which have been compiled by the State Mining Bureau, and, it is expected, will be shortly published. The dividends declared in the several districts of Victoria during the year aggregate £459,721. The number of "alluvial" and quartz miners at work during the year is set down at 27,889; of these, 13,019 are set down as "alluvial" and 14,870 as quartz miners. Of the "alluvial" miners, 10,907 were Europeans and 2112 Chinese; of the quartz miners, 14,754 were European and 116 Chinese. During the year there were fifty miners killed and eighty-three injured by mine accidents. Of these fifty fatal casualties, 28 were occasioned by falls of earth, rock, etc., underground; 4 by men falling down shafts, 4 by men falling down winzes and shoots, 5 by falls of materials down shafts, 2 by cage accidents, 3 by explosions of powder, 3 by explosions of nitro-glycerine compounds, and 1 by truck accidents. Table No. 9 shows the weekly salaries paid for different kinds of labor in the different divisions and districts. In the several districts the general manager's weekly salary varies from £2 10s in Rusbworth division to £10 in Sandhurst division of Sandhurst mining district; "legal managers" of mines are paid weekly from 10 shillings to £4; mining managers from £3 to £8; engineers average £3; shift foremen, £2 10s; miners, £2 5s; "surface men," £2; Chinese, £1 10s. The report is handsomely issued and bears evidence of careful editing.

Personal.

SUPT. G. McM. Ross has resigned his position at Iron Mt., Shasta.

MR. H. K. THURBER, formerly of the wholesale grocery house of Thurber & Co., of New York, is now operating the French group of mines near Hailey, Idaho.

Commercial Paragraphs.

THE Trenton Iron Company has a contract for a wire-rope tramway to be used for hauling logwood in Hayti. The order amounts to about $100,000. The structural iron work in connection with it calls for about $50,000 more.

THE Fulton Engineering and Shipbuilding Works have a contract to put in ten additional stamps at the Santa Rosa mine, near Perris. They have a contract with E. W. Chapman for a 40-stamp mill, air compressor, etc., at the Zintgraf mine, Amador Co.

THE Union Iron Works has the contract to furnish the new 40-stamp mill for the Champion Mining Co., Nevada City. This, with the 30 stamps now in operation, will make 70 stamps; it is calculated that the Champion, Wyoming and Merrifield have enough quartz to keep them going for an indefinite period.

THE Vulcan Iron Works of San Francisco are constructing a Vulcan wire ropeway, to transport sixty tons of ore daily, for the Ball Mt. Mining Co., Montana. They have recently shipped one of their large Vulcan band saw mills, for sawing logs, to the Sanger Lumber Co., Fresno, Cal., and are building a double circular saw mill complete for parties in Guatemala, C. A.

H. K. PORTER & Co. have shipped two pneumatic locomotives, one to Alaska and the other to British Guiana in South America, both to be used in gold mines. These locomotives consist principally of two huge steel cylinders seventeen feet long mounted side by side, in which the compressed air used for motive power is stored. Those shipped as stated have a capacity of 130 cubic feet and are provided with producing valves which deliver the air to the cylinders, pressure from 100 to 140 pounds. The engine is five feet high and weighs 18,000 pounds.

THE Pelton water wheel is distinctively a California product, and is justly regarded as one of the most useful and illustrious inventions of this or any other country. By means of it water is converted into power in so simple and economical a way that the machinery can be said to be almost dispensed with. Thousands of these wheels are sent out every year to all parts of the world, and the manufacturers claim that in no single instance do they fail to meet the most sanguine expectations of the purchasers.

A very high honor has been paid the Pelton Water Wheel Co. recently, in the award by the Franklin Institute of Pennsylvania of the Elliott Cresson gold medal, made as a just recognition of what is regarded by them as one of the most valuable products of American genius that has ever been produced.

This award is accompanied by an elaborate and exhaustive report made by a committee of scientists appointed for the purpose, which traces the history and progress of water-wheel practice from the early centuries down to the most modern and improved methods. The report concludes with the following paragraph:

We have given this invention the fullest and most unbiased examination permissible, within the time allowed us and within the compass of the literature at our command. We conclude that the Pelton water wheel possesses all the advantages of simplicity of construction, economy of installation and maintenance, adaptability to extreme heads of water, transportability, a close and sensitive automatic regulation, and of high speed, which belong to other wheels of its class which have preceded it, but for efficiency it has excelled all others.

We therefore deem the Pelton water wheel worthy of the Elliot Cresson medal, and hereby recommend the award of same to Lester A. Pelton, the inventor of this wheel.

Adopted at the stated meeting of the Committee on Science and the Arts, held February 6, 1895.

The Anti-Debris Association.

The State Executive Committee of the Anti-Debris Association met last Tuesday in Sacramento. Manager Phipps submitted his monthly report, showing the mines visited by the watchmen and stating: "It being a time of the year when the miners can do but little or no work, except to prepare for the coming season, I have had but one watchman on at any time. On the 22d of August a hearing was had before the California Debris Commission on the application of John Pascoe for a permit to mine in White ravine, in El Dorado Co. This is the party who mined in 1894 under permit, and whose dam in Chile ravine was carried away by last winter's storms. The Association filed a protest against the granting of a permit."

George Ohleyer, Chairman of the Legislative Committee, made a report upon legislation to come before the coming session of Congress.

The president and secretary were directed to write to the State Board of Examiners, stating that the act providing for a debris commissioner and his secretary, declared that they should receive compensation only while engaged in the performance of official duties, and charging that they have no official duties to perform, and that the act is inoperative.

The attorney of the association, Robert T. Devlin, was called upon for a report of the legal affairs of the association. He reported that the case of the United States vs. the North Bloomfield Gravel Mining Company would be heard on motion to relieve the superintendent from the operation of the case, on demurrer next week. In accordance with instructions received from the association, two suits will be commenced this week, one against persons mining by the hydraulic process on the Yuba, and the other against persons mining on the Feather. The papers are prepared and suit will be instituted the latter part of the week.

A communication was received from Congressman Grove L. Johnson in regard to securing appropriations at the coming Congress for river improvement.

The committee adjourned to meet at the same place in October.

Scientific Progress.

Is the Sun a Magnet?

The theory that the sun affects the earth either electrically or magnetically, or in both ways, has had until recently little convincing evidence in its support. The diurnal swaying of three magnetic needles with which magnetic observatories are equipped, the greater range of that swing at the maximum stage of the eleven-year sun-spot period, and the apparent coincidence in time between observed outbreaks upon the solar surface and the associated terrestrial phenomena of auroras, earth currents and magnetic storms have been adduced, but the first two were not conclusive, being susceptible of more than one interpretation. It has been deemed probable that the diurnal journey of the magnets was due to the movement of atmospheric currents, set in motion by solar heat, but charged with electricity of purely terrestrial origin. An increased heat emission from the sun at the sun-spot maxima, if it could be shown to exist, would, on the foregoing theory, account for the greater range of the diurnal swing at such times.

New evidence, however, has been brought forward. The electro-magnetic theory of light, originally advanced by Clerk Maxwell, has received confirmation by the German investigator, Hertz, and it becomes easier than before to believe that the diurnal magnetic phenomena are brought about by the luminous rather than the thermal radiauce of the sun. There are still some difficulties to be cleared up, and the case is not to be considered as proven; but distinct headway has been made.

Professor F. H. Bigelow, of Washington, D. C., in the *American Journal of Science*, shows some new facts which reflect credit upon the investigator and the branch of the American Government with which he is identified. For several years Professor Bigelow has been working at a task which the International Congress of Meteorologists abandoned after a decade of special study—the demonstration of a connection between weather phenomena and terrestrial magnetism, and the establishment of a new meteorology based ou that idea. Probably no one man until now has accomplished so much in that direction as the late Balfour Stewart. Professor Bigelow has, however, made distinct advances upon the work of his illustrious English predecessor, and has adopted new methods of inquiry.

He argues with considerable claim to scientific accuracy that the earth is immersed in a magnetic field, whose lines of force come in from space perpendicularly to the earth's orbit. He does not here trace those lines back to their origin. He merely shows their existence and direction, and that the influence thus revealed has a distinctly measurable intensity. But he has elsewhere giveu reasons for believing that this "polar" field, as distinguished from the "radiant" field, proceeds from the polar regions of the sun, his most forcible aud original evidence on that point being a periodicity in the behavior of his polar magnetic field corresponding to the sun's rotation period. The lines of force proceed from one pole of a magnct to the other along curved lines. If the magnet be a sphere, instead of a bar, the lines will take substantially such a course as those emanating from the top and bottom of the larger circle in the first of his accompanying illustrations; and they would impiuge on another sphere, situated relatively thereto as the earth is to the sun, subject to some refraction if that second body be, like the earth, a magnet.

The exact amount of such refraction depends upon the material and condition of the interior of the immersed sphere, and laboratory experiments made by the authorities in that branch of science have established mathematical formulæ applicable in such problems.

Professor Bigelow has taken the records of magnetic observations at twenty-six different stations, made suitable corrections for temperature, eliminated other sources of error, put the data through mathematical transformations that would render those for one station comparable with those for another, and taken out of these figures the amount representiug the earth's permanent magnetism and the well-known diurnal and annual deflecting forces. He theu has left residuals, indicating the existeuce of an additional influence. Upon a semi-circle, representing a single meridian of longitude, he marks off points corresponding to the latitude of his twenty-six stations, and then draws from each point a line which shall indicate by its length the total force and by its angle the direction, in a vertical north and south plane, of the mean of his recently discovered extraneous influence. These lines had been fouud to point almost due north or south. Those on the right-hand half of his diagram are merely duplicates of those on the left; but the fact that, so arranged on a single meridian, they fall into a symmetrical system, is to his mind conclusive evidence of the existence of the earth's being immersed in a magnetic field.

The angle at which these lines strike the earth enables one to compute the amount of refraction which they will undergo after penetrating the earth. Professor Bigelow is led to conclude that the interior of the earth is non-magnetic, and only the outer layers are permeable—in other words, that our globe is a magnetic shell.

A New Electric Pen.

Those who have a fancy for seeing a telegram in the actual handwriting of the distant sender can be gratified by having recourse to the telautograph. This instrument reproduces the message exactly as it is written by means of a stylus electrically connected with the sending instrument. An electric pen, working on an entirely different principle, and intended for autographic duplication, is now exhibited. The pen cousists of a holder bearing copper wires, which are connected at the end by a small loop of steel wire. An electric current, which is passed through the pen from a small, dry cell, warms the steel loop to a temperature somewhat above the fusing point of wax. The pen being then applied to a thin sheet of porous Japanese paper covered with wax, melts the wax as it transverses the surface, and the sheet is thus made into a stencil open for the transmission of ink. The stencil sheet is fixed in a frame, and from it copies of the original writing may be taken to practically an uulimited extent, with an inking roller in the usual way. Lines of any thickness may be made without impairing the reproducing power of the stencil. The iuvention is not like so many having a similar purpose in view, confiued to letter copying, but may be used for illustrations of all kinds. The whole apparatus is contained in a small, compact box.

Electricity from Coal.

A new electric battery has been devised by Dr. Borchers, of Driesburg, iu Germany, its chemical peculiarity being that the current is generated, not by the solution of metal but by the conversion of hydrocarbons and carbonic oxide into carbonic acid. As this is practically the same reaction that takes place in burning cool, the useful energy derived from the oxidation of a given weight of carbon in the battery can be indirectly compared with the effect of burning coals or coal gas to drive a steam engine, or in a gas eugine. A steam engiue utilizes about 18 per cent of the theoretical energy produced by the oxidation in the boiler furnaces of the coal used to drive it, and a good gas engine about 25 per cent, while Borcher's battery is said to have delivered at times, in available form, 38 per cent of the energy liberated by the consumption of carbon in it, and at no time to have delivered less than 26 per cent. Enthusiastic admirers of the new battery claim it will not be long before steam boilers are abandoned and power derived entirely from batteries and distributed through wires and electric motors, but the cold requirements of practice do not lend much hope to what is still a fanciful theory.

Mechanical Progress.

Barring Engines.

In the early days of factory engines the single-beam engine was the sole motive power, and it frequently happened that the crank would stop upon the dead point. For this it was necessary to find a means for starting the engine, and for such engines as then employed it was sufficient to place a rack upon the wall behind the fly wheel and use a crowbar, bearing upon the arms of the wheel, and with its point in the rack.

When toothed rims took the place of the fly wheel there were usually a pair of eugines, and these would start from any position, and the bar became unnecessary, except for occasions when repairs were in progress and a slight movement of the engine was needed. For that purpose a rest was fixed on the floor close up to the spur wheel, and the teeth of this were used as the point of application of the bar.

With the advent of ropes for main driving and the progressive increase in the size and power of engines, the power of one man to turn them became insufficient, especially where, as often happened, many of the machine bands had been left on the working pulley, for many of the workers will always insist upon getting the maximum of revolutions out of the machines and are thus apt to leave belts in positiou. The frequent employment of the single engine again, which is found to give perfectly steady turning effort with the aid of the large fly-wheel rims now employed, demands some means of turuing the crank off the dead point, and the demand was strengthenod still more by the necessity of something to turn even the double engine when new ropes were being put on.

All these considerations led to the employment of barring engines, so arranged as to gear with an internal toothed rim, carried inside of the large rope pulley. When the small engine revolves it drives this large pulley round through the medium of a pinion, which gears in the above internal spur, and of a worm gear, the worm being on the shaft of the small engine.—William H. Booth in Cassier's Magazine for September.

Calcium Carbide.

Dr. E. G. Love, in an article on "Acetylene as an Enricher," in the *American Gas Light Journal*, says: "Theoretically a pound of pure carbide will give 5.91 cubic feet of acetylene.

"I see no reason why the carbide, when furnished in large quantities, cannot be expected to yield five feet per pound, or 10,000 feet per ton." The European papers have been talking adout acetylene for some time past, and Vivian B. Lewis, in a lecture at Edinburg, Scotland, said: "This acetylene generated by acting upou the carbide with water is practically pure, and samples made with merely ordinary precautions give, on analysis, upward of ninety-eight per cent of pure hydrocarbon."

Acetylene has a very peculiar odor, somewhat resembling that of garlic. When a light is applied to acetylene it burns with a luminous and very smoky flame; if air is mixed with it it burns with a red flame and gives off smoke in large quantities. In the proportion of one of acetylene to one and one-fourth of air the mixture is slightly explosive, but a mixture of one of acetylene with twenty volumes of air is non-explosive. When burned with the lava tips it is smokeless.

It was said in a paper read before the Franklin Institute that the carbide could be supplied for $5 per ton. If that is the case, and 10,000 feet of acetylene can be made from it, it would put the price of the gas down to fifty cents per 1000 feet, or one-third of the price now charged by ordinary coal gas companies.

Cheap Steam Navigation.

As indicating the great economy of steam navigation on the Great Lakes, it is interesting to take from the *Marine Review* some figures obtained by a party of students through tests made without preparation upon a lake steamer on its usual trip. The Rappahannock is a wooden screw steamer for carrying freight, and had a cargo of 2400 net tons (80,000 bushels) of wheat from Duluth. The draft was 14 feet 4½ inches, or but little more than the intended depth of the canals on the St. Lawrence route to tide-water and Europe. The mean speed of the Rappahannock was by the log 12.75 miles per hour, which is a fast average for a freight boat. The coal used was ordinary run of mine, costing about $2 per ton at Lake Erie ports. The boiler and machinery tests showed that the cost of fuel was one cent per ton of cargo for 157 miles' run. This is equivalent to carrying one ton one mile for 63-100 of a mill at the recorded speed of 12.75 miles per hour. Of course, to this fuel cost must be added all other expenses for the crew, for dock charges, for depreciation aud repairs, for interest on capital, and the like, before the real cost of transportation could be found; but the low cost of propulsion—one of the most important factors—is remarkable.

One recent commercial fact leads an English exchange to make some pointed comment. It is the shipment of a thousand tons of steel billets from Ohio to England. If any one had predicted twenty years ago that England would be importing steel, he would have been regarded as insane; but here is the actual fact of a large shipment of American steel to England, and that while our own iron and steel industry has suffered a great decline. Few English people have any conception of the immense development of the iron and steel industry in the United States. There is, of course, unlimited raw material and the vastest and most efficient machinery in the world. The result has been a great decline in price, the Pittsburg price for steel rails having been $40 in 1873 and only $22 per ton in 1891-95. The prices of pig iron have shown a similar fall. The exchange referred to says: "The honest truth is that we shall have to make up our minds to a loss of commercial supremacy in the near future to the United States in many important staple industries."

How gas is to be made to light itself is the question which is now reported to have been solved. The invention is simple. The self-lighting gas burner is simply an ordinary gas burner with a small tube at the side. This is screwed into the bracket or other fitting, the gas is turned on, and in from six to ten seconds the gas lights itself. This is how it is done: The gas in issuing from the burner passes over a small knob of porous material impregnated with a rare and indestructible metal, which, as soon as the gas passes over it, becomes red hot; this red heat is communicated to a small piece of platinum wire, which immediately becomes incandescent and lights the gas. This little black knob is practically indestructible, as is also the platinum wire. Therefore, as long as the burner exists, the gas on being turned on will light itself. The burner and lighter is of the ordinary size, and is made to fit any existing fitting.

The waste heat in the blacksmith's forge is now utilized in pumping the bellows. A small water-tube boiler sits just over the firebox and an engine of the simplest form attends to driving the bellows.

Electrical Progress.

Electric Power Transmission.

H. P. Livermore, general manager Sacramento Power and Light Company, has received the following letter:

DEAR SIR:—In answer to your letter of June 26th, relative to electrical transmission of power at our works, I would say:

We first introduced electric power in 1890, when we rebuilt our erecting shop, where we put in two 100-ton Sellers electrical traveling cranes and four Gib cranes of various capacities. At first we had trouble with motors burning out, but soon overcame that, and these cranes have given us the greatest satisfaction since.

The next building to be remodeled was our wheel shop. This shop required heavy line shafting, which of course prevented the use of traveling cranes. This was a cause for serious objection, and was one of our main reasons for using electricity. Since this shop was completed our experience with the motor system has far exceeded our expectation.

We have about twenty-five motors, each running its own tool, aggregating from 350 to 400-horse power, driven by a 100-horse power generator (Westinghouse), which is never overloaded, although all of the machines may be running at once. This is proof that only as much electricity is generated and used as is needed to do the work, and it is because there is no time that all of the machines are working to their full capacity together that we are enabled to couple as many motors or horse power to this small-size generator, comparatively speaking.

We calculate that we save 30 or 40 per cent of power in this shop by doing away with line shafting and heavy belts. Our method of connecting the motors to machines is extremely simple, and is our own idea. We prefer the use of belt connections because it gives elasticity; because there is less power lost in transmitting than by the use of gears, and we are able to keep the cone pulleys for variable speeds, which is far more satisfactory than by using a controller which, at best, will not give over two and one-half times the initial speed, or a rheostat system. Our belts are very short, to be sure, but we experience little or no trouble on this account.

The saving in this shop is enormous over our old methods, because we can now use a traveling crane, and two men can load a pair of wheels on a machine in five minutes, where before it took ten men thirty minutes, and indirectly this is all due to the use of electricity, because otherwise we must have held on to our line shaft and belts, and consequently could have no traveling crane.

We are now putting in a 250-horse power Westinghouse direct-connected engine and generator, and it is our intention to run our frame shop and two large machine shops by electric power within the next four months.

On the first floor we will follow out precisely the same method as described, namely, traveling cranes and motors for individual machines. On the other two floors we will keep the line shaft, but divide it into several sections, say of twenty-horse power each. This is an advantage where there is any hurried work and you may wish to run one or two machines overtime. Hoping that this information may aid you, I remain very truly yours,

BURNHAM, WILLIAMS & CO.,
Baldwin Locomotive Works.
S. M. VENELAIN, Sup't.
Philadelphia, July 3, '95.

Aluminum by Electrolysis.

One of the first uses to which the current generated at the large Niagara Falls electric plant has been put is the manufacture of aluminum from bauxite by electrolysis. What the value of such a source of electric current may be to factories in the neighborhood of Niagara, to say nothing of those at a distance, is suggested by the fact that, although the present aluminum works are constructed to produce 5000 pounds of pure aluminum a day, the complete success of the electrolytic process has convinced the management that the doubling of the resources of the factory by its means is comparatively a simple matter. More pots are to be put in as rapidly as possible until 10,000 pounds of the pure metal, worth in small quantities 50 cents a pound, is being turned out daily. The process is described as follows:

Pots containing oxide of aluminum, or alumina, which is to be changed into pure aluminum, are arranged in long rows in a large reduction room. Each pot is lined with carbon, the lining forming the negative electrode in the process of reduction. The positive pole consists of a row of copper rods, terminating in a huge carbon anode, which extends into the pot. The oxide, in a pulverized state, looking very much like flour, is placed in the pot, the carbon anodes extending through the mass, and the current carried by great copper rods through the entire length of the rows of pots is turned on. The electricity is allowed to do its work for twenty-four hours, after which the pure aluminum is drawn out and cast into ingots. By the new process the aluminum, which is separated from the ore by the action of the electricity, and the fluxes used to facilitate melting, accumulate about the negative electrode, which in this case is the carbon-lined bottom of the pot. The ingenuity of this arrangement is evident. The tremendous current heats the carbon of both the lining and the anodes to the point of whiteness, and the melting of the ore by this heat is an important factor in the manufacture of the metal. As it is ladled from the pots, it looks like ordinary lead heated to a red heat, but when poured into the moulds it glistens with almost snow-like whiteness, and the roughly cast ingots thus produced have the luster of polished silver.

Long Distance Lines.

There are a great many phenomena in ordinary electrical work that electricians find it hard to explain; but an entirely novel class of electrical demonstrations have been observed in the new practice of transmitting currents over long distances at high voltages. On the circuits of the San Antonio canyon transmission, southern California, where current is sent about fifteen miles to Pomona, and about thirty miles to San Bernardino, the line has been found, during hot, dry and cloudless weather, to be heavily charged by the mere wind; and the rate in which the line was electrified in this way was actually governed by the speed at which the wind was blowing. It was also noted that the substances blown against the trees at such times—dust, etc.—gave up their charges to it also. When the high tension current reaches the distributing stations at Pomona and San Bernardino its 10,000 volts are passed through a transformer, and reduced to such a pressure as can be safely passed along the town circuits for lighting and power purposes. In effecting this change, the transformers give forth a continuous hum, which depends for its intensity on the number of alternations of the current. This forms an excellent indicator for the attendant, whose attention is instantly called to any change in the running conditions of the plant by the resulting change of tone. This variation in the sound from the transformers not only marks changes that are taking place and that can be detected on the voltmeter, but also gives notice of coming changes before there is any other indication of them. One afternoon a painful shock was obtained on touching the line at the canon end, drifting clouds and a strong wind being noticed in the valley. Again, while the engineer was using the telephone, he heard it in a report which was so sharp as to cause momentary deafness. Later, after a moderate wind had been blowing for some time, loud reports were noticed on the telephone at long intervals. As the wind rose the reports came oftener. It was evident that there was a discharge from the lines through the telephone (which was on a metallic circuit), and that it depended on the rate the wind blew.

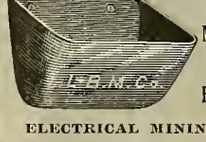
The Alternating Current in Motor Work.

Till recently the alternating current could not be successfully used for motor work. The only motors available were of the synchronous type, so called because they run at the same speed or in a certain proportion to the speed of the generator. When operated on single-phase circuits they are not self-starting but must be brought up to their normal speed by an independent source of power. The load is then carefully applied by a friction clutch. If the work to be done is for a moment in excess of the capacity of the motor, they get out of step, as it is called, and stop. They require a separate machine as an exciter to energize the field. It will thus be seen that their use for general power purposes is limited. By the introduction of what is known as the multiphase systems all difficulties have been overcome, and alternating current motors are now manufactured which are equal to the best direct-current motors in efficiency and starting torque, and which have the additional advantage of having no commutator or moving contacts of any kind. The three-phase system, which has so far been more generally adopted than its rival, the two-phase, may be best described as a combination of three separate alternating currents in which the reversal occurs at different times. The result is that the impulses which produce the rotation are at no time entirely interrupted.

ELECTRICITY now enters more or less into the preparation of what we eat, drink and wear, and there are many articles of utility now produced by its aid. The residents of many cities in the United States have their houses protected, lighted and heated by electricity. They go to their places of business in cars run by electricity, the elevator by which they reach their office in high buildings, or the machinery in their factory, is run by electricity. The bell which summons them to church is rung by electricity and the church organ is played by electricity. Electricity brings the news to them from all parts of the earth; stamps their letters, automatically sounds the alarm in case of fire, rings the door bell, cooks the food, and fans them while eating it. When they go to the dentist their teeth are drilled and filled by electricity, and miniature electric lamps are now constructed for the use of doctors in diagnosing diseases. The patient swallows a lighted lamp, which illuminates his person so as to enable the physician to make a correct diagnosis. The barber cuts or singes the hair by means of electricity, the streets are lighted and the farm cultivated by it. By means of it we can talk with our friends 500 or 1000 miles away and hear their voices as distinctly as though they were in the same room. The telephone is perhaps in more general use in this country than electric lighting. Even in small towns telephones form a part of the furniture of many private houses, and are used to transmit orders to the butcher, baker, etc. There are now some 85 electric railways in the United States and 9000 miles of track, employing 23,000 cars. With the aid of electricity natural forces which have heretofore run to waste are being turned to the service of mankind. The American river has already been made to furnish motor power by which Sacramento is lighted, and by which its street cars and factories are run, and new projects are in progress all over the State.

Practical Information.

Cheap Coal.



It now begins to look as if California, instead of being a State where fuel is very expensive, and manufacturing difficult, would soon be in the front rank of States which enjoy cheap fuel. Apart from the rapidly developing oil industry, there are a dozen large schemes on foot for the development of electric power from water in the mountains. This, apparently, is not very encouraging to coal producers, yet a big enterprise is being developed in the central part of the State for the supply of cheap coal to that section. For some time past work has been going on quietly on a standard-gauge railroad from the city of Stockton to coal mines at Corral Hollow, which are located about forty-eight miles from that city, in Alameda and San Joaquin counties. There are already over ten thousand feet of tunnels and crosscuts, and the owners are now preparing to take out coal. The amount in sight has been estimated at sixty million tons. The product of the mine is described as a glossy black coal, containing no sulphur. From twelve to fifteen hundred men will be put to work as soon as mining begins, with which force it is said that about fifteen hundred tons can be extracted daily, which will be sold at from $3 to $3.50 per ton. This is likely to exclude Oregon, British Columbia, Australian and other coal in a territory that consumes about five thousand tons a day.

IT may be that before long, says the *Enticelle Electrique*, glucinium will come to assume a genuine importance in the electric industry. Of the atomic weight, 9.1, and epiderfic weight, 2, the resistance of traction of glucinium is no greater than that of iron, and its conductivity is equivalent to that of silver. This metal is therefore mechanically more resistant than iron, a better conductor than copper, and besides is lighter than aluminum. If all these data are verified by experiment, there is no doubt that glucinium will soon be employed in electricity, and the more so in that its market value will be about $20 a pound, which is very much less than the same volume of platinum or the same weight of the latter metal.

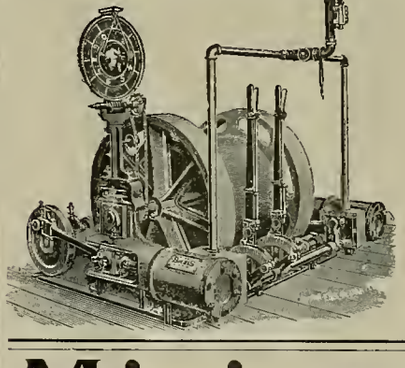
The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.



We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

Send for Catalogue and Price List.

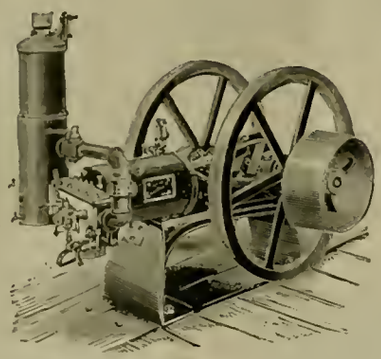
MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.



DEWEY & CO., PATENT SOLICITORS,

220 Market St., San Francisco, Cal.

CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2¼c per horse power per hour.

A REVOLUTION IN ORE PULVERIZING.

THE

Merralls Hydraulic Quartz Mill,

The Greatest Ore and Rock Pulverizer in the World, Either Wet or Dry.

THE ONLY MILL BUILT THAT RIVALS STAMPS. Our six-foot mill (No. 1) will reduce more ore or rock to pulp than a ten-stamp mill, with less than one-half the power and less than one-half the wear and tear, besides saving a much larger per cent of the gold in the ore.

This mill will reduce from 25 to 500 per cent more ore than any other rotary mill in use. Cheap, simple and economical. Four sizes built—from 15 to 250 tons capacity.

Send for Circular. Address

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 19. 1895.

Iron, steel and copper are buoyant in price and active in demand. Copper, by reason of the great demand in electrical lines, is especially strong. Silver barely fluctuates, holding at the 67 mark. An amusing statement is gravely made in a leading financial paper that Eastern jewelry manufacturers "have advanced the price of all their silver goods ten per cent, because of the decreased production of silver."

Bradstreets says: "Old rails and scrap have advanced $1 to $2 per tou the past week, with large sales, including a considerable tonnage to go west."

Bessemer ore from Lake Superior districts is practically out of the market.

The *Iron Age* reports that pig-iron production on September 1st amounted to 194,029 tons weekly, as compared with 180,524 tons on August 1st, with 151,113 tons on Septemher 1, 1894, and 83,434 tons on Septemher 1. 1893. Further than this, more furnaces have blown in since the 1st inst., so that "we are now getting on at a rapid rate to the 200,000-ton mark for weekly output, and are now making more iron than ever in our history, or that of any other country. Production is still increasing, and yet seems unable to keep up with the demand in certain branches."

The Steel Rail Manufacturers' Association at New York named $28 per ton f. o. h. Eastern mills as the price at which they are prepared to transact business in rails of forty-five-pound or heavier sections. This is an advance of $4 per ton.

Mining Share Market.

SAN FRANCISCO, September 19, 1895.

There was continued activity the past week in the shares of the Gold Hill group of mines, with Confidence and Challenge the leaders. The former started at $2.00 and advanced to $2.50 and then fell back to $2.15, from which figure it moved up to $2.75 and then sold down to $2.60. Challenge started at 77 cents and moved up to 93 cents, then set back to 83 cents from which figure it made a quick move to 99 cents and then down to 93 cents. In the latter, Yellow Jacket sympathized the most, going up to 59 cents. The other Gold Hill shares moved more sluggishly. Shares in the middle and north-end groups, outside of Andes, did very little. The latter sold up to 53 cents. The trading seem to have little confidence in the market, particularly owing to Con. Virginia keeping back. For several years the shares in this mine have been the pivot on which the market hinged, and its eratic moves are more apt to create distrust than inspire confidence. In outside shares there is very little life, although Bodie more than carried its assessment and holds fairly steady at the advance.

The news from the Comstock mines is of an encouraging character. From one end to the other the work under way is of an important character. Much of this is necessarily of a preparatory nature, which, when completed, will be followed by energetic work in directions calculated to strike ore. This has particular reference to the mines in the north-end and middle groups. In the Gold Hillers the work seems to he towards the west, so as to strike the west lode found iu Confidence. In the latter they have run a crosscut to find the width of the veins, and reports state that it is over twenty-five feet wide, with an average assay value of from $50 to $65 a ton, mostly gold. It is stated that drifting either in the ore or alongside of it will soon he started, so as to open up the Challenge ground. When this is done it is probahle the drift will be run into Con. Imperial ground, to make connection with the west cross-drift that is heing run by the latter. This would give splendid air connection. It is reported on the street that Alpha has struck the west lode, hut as yet official letters have not verified the rumor. If the lode has not been struck it will be before long, provided the west workings are not discontinued. In Crown Point and Kentuck preparatory work is heing done to push for the west lode. Owing to a fall of water in Carson river the extracting of ore by the former company has been suspended, hut other work has not been stopped. Belcher, Overman and Seg. Belcher are taking out a few tons of ore each week as exploiting work is pushed. As Yellow Jacket is incorporated under the laws of Nevada very little information is allowed to leak out regarding the work heing done. In Con. Virginia good progress is heing done to open up the 1100 and 1000-foot levels. While this is under way, work is not neglected on the lower levels. It would seem from official advices that Andes is preparing to take out ore, provided it is found in sufficient quantities. In the other north-end mines and also the middle group the character of the work is essentially unchanged from that reported some time past.

Work on the Brunswick lode does not attract attention since the movement in the Gold Hill shares, but if expectations should be realized after active exploiting work is under way, it is reasonable to expect more activity in the shares of the mines controlling ground on this lode. Preparatory work is still the order in all except Occidental. It will probably take several weeks before they will he in position to drift for ore. In Occidental more or less exploiting is under way, hut as yet nothing has developed of an important character.

The market opened yesterday strong for the Gold Hillers and steady for the middle and north-end shares. Under strong huying Confidence sold up to $3.10 and Cballenge to $1.10 after the regular call. Crown Point, Yellow Jacket and Belcher, and others in the Gold Hill group, advanced slightly. The rest of the list were stronger but did not move up much outside of Savage, which sold higher owing to reports of new work to he started soon.

The following illustrates the changes of the week:

MINES.	Sept. 12	Sept. 19

BOYD'S

Compression Grease Cup.

The Only Cup in the Market that will give Perfect Satisfaction.

We call special attention to the Strength of the Cup, together with the High Top, which permits the use of a powerful spring that works throughout its full extension, thus ensuring the feeding of the entire contents of the Cup. Also to the Automatic Air Valve, which breaks the vacuum underneath the plunger and thus enables the Cup to be opened at any stage of the feeding without exertiou or sucking back the grease or compound from the bearing. This is the only effective device for this purpose ever applied to a Cup. These cups are manufactured in several designs and sizes, suitable for various purposes. For Journals the screw top lever is ordinarily used, and can be furnised with Spring pressure or with Screw pressure without a spring; both forms, however, have the Automatic Air Valve. For loose pulleys a specially fastened hinge Cup with Automatic Air Valve is made, as shown in the cut.

Oils, Greases, Lubricants, Engineer's Supplies, Paints and Brushes.

WANTED!

A PRACTICAL PLACER MINER,

Capable of taking charge of hydraulic plant.

Address, stating salary expected, TEMPLE BAR, Kingman, Arizona.

THE

LIXIVIATION OF SILVER ORES

WITH HYPOSULPHITE SOLUTIONS.

By CARL A. STETEFELDT.

Second Edition. Completely Revised.

Published and Sold by the Author,

967 Alice Street.....Oakland, California.

PRICE, BOUND IN CLOTH, $5.00

Hydraulic Mine for Sale.

Not on a navigable stream; in northern California. Good dump; no trouble with tailings; 180 acres of mining ground; 5000 inches of water. Can work eight months in the year. Ample opportunity given a buyer to fully test the property before payment is made. For further details,

Address X, 2022 W St., Sacramento, Cal.

Assessment Notices.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Fairfax, Marin County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 23rd day of August, 1895, an assessment, No. 4, of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 21st day of October, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room No. 56, No. 309 Montgomery street, San Francisco, California.

SONORA EXTENDED MINING CORPORATION.—Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of August, 1895, an assessment, No. 3, of 2½ cents per share was levied upon the whole of the capital stock of the corporation, both paid and unpaid, payable immediately in United States gold coin to the Secretary, at the office of the company, 213 Jackson Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1895, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 28th day of October, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. A. STRATTON, Secretary.

Office, 213 Jackson Street, San Francisco, California.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 27) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Name.	No. Cert.	No. Shares.	Amt.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PROCESS OF PRESERVING TIMBER.—William G. Curtis und John D. Isaacs, San Francisco, Cal. No. 545,229. Dated Aug. 27, 1895. The object of this invention is to provide an improved process for impregnating timbers with preservative fluids, and means for a more perfect preliminary drying of the timber, a thorough impregnation with the preservative fluid, and a less loss of the preservative fluid by evaporization, together with a less amount of time necessary for the completion of the process. The process also prevents the timber from checking and cracking as much as it has hitherto done under processes formerly used for the purpose.

RAILWAY VELOCIPEDE. — Max Sternberg, Crefeld, Germany. No. 545,746. Dated Sept. 3, 1895. This invention relates to that class of velocipedes especially adapted for travel along the rails of a railway and used by track walkers and others having charge of the roadbed. The main object of the inventiou is to provide n velocipede which can he quickly made to occupy hut a very small or narrow space, in order that it may he taken out of the way instantly in situations where the space is very limited, as hetween two tracks in tunnels aud narrow cuts, on hridges and trestles, and hy this capability adapt the machine for operation and use at times when it would otherwise he dangerous or inadvisable to proceed upon the road with a machine. Another object of the invention is to determine any variation in the gauge of the tracks. The machine consists essentially of an outer or halancing wheel connected with the main portion hy a joint, whereby said wheel may be turned from a horizontal or working position to a vertical position, out of the way; a curved har connected with the support of the wheel and slidably mounted in the main frame of the machine, and means for engaging said har to effect the change of position of tbe wheel. The outer or halancing wheel has a spindle slidable in the axle, adapting said wheel to move laterally with any change of gauge, and electrical devices are provided hy which this lateral movement of said wheel is adapted to sound an alarm, therehy notifying the rider of a change of gauge.

MACHINE FOR MAKING AND FITTING TONGUES OF KEY-OPENING CANS.—James Gould, Jr., Berkeley, Cal. No. 546,146. Dated Sept. 10, 1895. The object of this machine is to make and fit the small pieces of metal called tongues to the flanges of exterior tight-fitting heads of cans, wherehy the latter may he opened hy means of a key applied to the tongue, and by which the flange of the can head is torn off. The tongues may he introduced under the flanges of the heads, a portion of said tongues remaining beyond the flange, or, as is more common, they may be caused to intersect the can-head flange, and in either case the machine consists, as a whole, in means for feeding the headed cans; means for receiving and conveying them successively to position; means for holding them in position against end thrust; means for feeding a sheet of tin and cutting it into tongues; means for directing the tongue to place, pressers acting on the hody hetween the tongue and head flange edge; and means for forcing the tongue edgewise hetween the pressers and hody to its place under the can-head flange.

RUPTURE CURED!

NO DANGER. NO OPERATION. NO PAIN.

611 and 613 FRONT ST., San Francisco, Cal.

THE BLASDEL IMPROVED ORE CONCENTRATING BELT.

We are now having our belts made by the best rubber manufacturers in New York and Boston, under written guarantees both as to quality and mechanical construction.

We have been granted two United States patents for improved devices in concentrating belts, the first and most important of which is for a slight rifling of the surface at intervals and crosswise of the face of the belt.

While these riffles are only about one-thirty-second of an inch in depth, they are very effective in saving floured sulphurets and reclaiming quicksilver and amalgam that may escape from the plates, thus gaining a large percentage of values that would go off with the tailings from belts with entirely smooth surfaces.

Our second patent is for an improvement in the flanges which practical mill men will appreciate. They stand at an acute angle inwardly, therefore they thoroughly confine the pulp on the belt; and in passing over the end pulleys of the machine, lie partly down, consequently do not crack or break, as do the old-style flanges; thereby much vexation and loss is avoided. *We keep in San Francisco and New York belts of all lengths and widths suitable for all concentrators in general use.*

Alcatraz Asphalt.

In noting the mineral wealth of California and its development the PRESS in this issue brings to public attention a new industry which has recently been developed and created in this State—a manufactured product that through merit has made a market for itself in the East.

In the southern part of the State, where the shore line trends almost due east and west, and close to the ocean, lie enormous beds of asphalt which have been rudely utilized since the days of the early Spanish Mission Fathers, but of late have been acquired by a California corporation — the Alcatraz Asphalt Company — which has proceeded in a scientific manner and on an extensive scale to produce a high-grade asphalt and build up a great manufacturing business.

Trinidad asphalt has long been used for paving purposes. In its crude state it contains about forty per cent of bitumen, the remainder being clay and vegetable matter. In the refining process and when used for street work it is fluxed with residuum oil, the mixture being mechanical and consequently liable to disintegration. The California asphalt as prepared for use is a natural compound of elements that form a chemical union, making it of superior value for pavements and street work. The Alcatraz rock asphalt is a natural product, containing when mined about sixty per cent bitumen, the residue being silica, free from clay or organic matter. The Alcatraz liquid asphalt is a pure liquid bitumen, separated from the parent beds of shale by apparatus admirably designed for the purpose. The Alcatraz asphalt paving cement is a combination of these two materials, forming a perfect paving compound, elastic and permanent, not cracking nor melting, possessed of sufficient body of bitumen to withstand the wear of street traffic, and devoid of the objectionable petroleum residuum that makes the ordinary Trinidad asphalt so comparatively short-lived and unsatisfactory. The pavement on the street in front of this office—Front from Market to Pine—is a good example of what an asphalt pavement with plenty of bitumen in it will stand in the matter of heavy street traffic. Loaded trucks traverse it constantly, yet it shows little signs of wear.

W. N. Cowles, the president of the Alcatraz Asphalt Co., whose office is in the Crocker building, this city, says that the company has about 35,000 acres of this deposit on the shore in Santa Barbara county, one deposit at Las Conchas, another at La Patera, north and south respectively of the city of Santa Barbara, and about twenty-two miles apart. The process of manufacture is interesting though simple. Herewith are presented illustrations of the industry. Fig. 3 on page 200 represents men at work at the Las Conchas mine at Carpinteria, in an open cut directly in front of the refinery, the flume on the left dumping the residual sand or "tailings" into the ocean, where the tides sweep it away. The monthly output at this surface mine is about 1000 tons. Fig. 4 on page 200 is a part of the same "mine," the high bluff on the right being directly on the beach. Fig. 1 on this page shows the method of hydraulicking there, which is different from that in use in a drift or gravel mine, the process in this case being simply the washing away of loose, superimposed sand from the bitumen deposits. Fig. 2 on this page shows a different form of extracting the bituminous deposit at the other mine, at La Patera, where about 750 tons are monthly mined, 200 feet being so far the deepest level. Fig. 5 on page 200 represents the rock asphalt in a tunnel at a depth of 125 feet in the same mine. Fig. 6 on page 201 gives a view of the camp at the same mine and that part of the California coast line. Fig. 7 represents the ore dump at the mine.

FIG. 1.—HYDRAULICKING AT LAS CONCHAS MINE.

FIG. 2.—SHAFT NO. 4, LA PATERA MINE.

The company employs about 100 men, the plant being lit and operated by electricity. The asphalt when mined is carried to the refinery, where it is freed from impurity, the process making it possible to bring it to any required efficiency. It is then fluxed and prepared by the addition of a liquid asphalt extracted in the same plant but by different apparatus, to a purity of 98 per cent bitumen. When both are melted together, forming

TABLE OF CONTENTS.

EDITORIALS.—Alcatraz Asphalt, 197. The President and Secretary of the Cal. State Miners' Ass'n: The Committee on Protection to Mineral Lands and W. H. Mills: California Iron, 198.

ILLUSTRATIONS.—Hydraulicking at Las Conchas Mine: Shaft No. 4, La Patera Mine, 197. Alcatraz Refinery at Las Conchas Mine, Looking West; Portion of Las Conchas Mine, Looking East; Alcatraz Rock Asphalt in Tunnel at 125-Foot Level, 200. General View of Camp at La Patera Mine; Ore Dump of Alcatraz Rock Asphalt at Mine, 201.

SCIENTIFIC PROGRESS.—The Maxim Gun: Expulsion of Gases From the Interior of the Earth: Mars Inhabited: New Method of Artificial Respiration: Large Steel Ring: Heat of Summer: A New Industry, 204.

MECHANICAL PROGRESS.—Compressed Air: The Telephotograph: Transformation of the Aspect of the Entire Earth: Building Ships and Railway Trains of Aluminum: The Most Powerful Explosive yet Produced: Reason for Doubting that Oxygen is an Element, 204.

ELECTRICAL PROGRESS.—Accumulator Traction, 204. Unique Propositions: Without a Trolley, 205.

PRACTICAL INFORMATION.—The Nearest Fixed Star: New Railroad Across Tehuantepec, 205.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 202-3.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 210.

MISCELLANEOUS.—Concentrates, 199. Crushing the Apprentice; Some Legal Points, 200. Critical Periods in the History of the Earth, 201. Books Received; Personal; Coast Industrial Notes; In Answer to Questions; Notices of Recent Patents, 208.

It is understood that Hon. J. H. Neff declines to further assume the responsibilities of the presidency of the California State Miners' Association and that W. C. Ralston has no intention of accepting the secretaryship for another year. Both gentlemen consented to serve last November only in response to the unanimous and urgent request of the convention, and feel that they have done as much as could reasonably be expected of men in giving valuable time and service to the cause, a feeling that is shared by other prominent members of the association, who will, probably, at the next convention ask to be relieved of the duties they have carried on since accepting the unsought positions. The secretary's office is the only salaried one in the association. The salary is $50 per month; the present incumbent has drawn no salary for nearly a year, and proposes to donate the amount due him to the association. His services have been of such manifest value as to render detail unnecessary. The same may be said of the honored president who has given freely of his time and money to further the aims of the association. There is no profit but some honor in worthily filling those and similar positions in the councils of the association. Could solicitation prevail it were wise to secure the consent of those gentlemen to their re-election. If they positively decline to serve, the next best thing is to see that their successors are in every respect worthy representatives of the miners. It is neither the province nor the purpose of this journal to suggest names of possible candidates, even if it were certain that those named and others in the association's councils would positively decline re-election. That is a matter for the miners themselves solely to determine. It is in order, however, to say that in this as in other things any one who persistently seeks a position and tries to "pledge" delegates to support him, does not at the start evince the possession of the qualities necessary for impartial success.

In last week's issue was printed in full the communication of the Committee on Protection to Mineral Lands, sent to Mr. W. H. Mills on the 17th. Under date of the 25th that gentleman returned the communication to the committee, and vouchsafed the information that he had only read the first paragraph, and that as he only represents the Central Pacific Railroad Co. he is unable to proceed in any negotiation that assumes representation by him of any other corporation. In this communication, written eight days after receipt at his office of the committee's communication, Mr. Mills begs to call attention to the fact that his former communication remained unanswered for 27 days. The committee promptly replied that, had Mr. Mills taken the trouble to read their communication of the 17th inst., he would see that the cause of the delay in answering his former communication was that President Neff had been placed on the committee, that his advice and co-operation were essential, that he was absent in Boston, Mass., and elsewhere in the East, not returning to his home in Auburn till the 16th, and that the following day the answer to Mr. Mills was sent, which, under the circumstances, was remarkably expeditious. Regarding Mr. Mills' statement as to any needed change in the wording of the communication of the 17th, the committee in its answer of the 25th courteously directs that gentleman's attention to the fact that he is not asked nor expected to act for any company that he is not empowered to represent, and expresses the belief that if he desired to expedite the negotiations he could have embodied his amendments in his communication. It might sound prejudiced to say that Mr. Mills was trifling with the committee; it might seem unjust to assume that he is trying to fill up the time till the Miners' Convention in diplomatic postponement of consideration of his own proposition; it might appear unfair to imply insincerity and lack of real intent on his part; but any one who did trifle with the committee, who did try to tardily use up the time of the life of the committee (which expires October 14th), and who did evince insincerity, would act in this matter in a manner very similar to the tactics so far adopted by the official representative of the landed interests of the Central Pacific Railroad Co.

Iron in California.

Though California is rich in iron ore, there is little active effort to utilize it. Extensive deposits of excellent quality exist in several parts of the State, but since the cessation of operations in Placer County there appears little incentive in even less favored localities, the matter of fuel and transportation militating largely against development. Recently it was stated that the Tepustate mine in Lower California would be worked by its owners who also control the Oswego, Oregon, iron mines, the idea being to mix the high grade Tepustate ore with the inferior northern ore. It was estimated that there were 500,000 tons of ore in sight, and arrangements were in progress for shipment, but this week it is learned that the project has been tabled. A recent analysis of the Tepustate ore gave the following contents:

Iron peroxide	89.64
Iron protoxide	5.27
Alumina	1.40
Silica	1.38
Sulphur	1.30
Phosphorus	0.32
Manganese	Trace
Lime	Trace
Metallic iron	68.85

The unusual freedom of this ore from sulphur and phosphorus makes it of manifest value in the manufacture of Bessemer steel or ferro-manganese. Los Angeles Co. possesses several valuable iron deposits, particularly one two miles from Lang, on the S. P. Ry. A recent analysis of this ore gave the following result:

Sesquioxide of iron	68.070
Protoxide of iron	23.000
Alumina	2.843
Oxide of manganese	1.750
Lime	.310
Magnesia	2.161
Phosphoric anhydride	.108
Sulphuric anhydride	.140
Silica	1.810

In the Minaret mountains, in the northeastern part of Fresno county, is an enormous deposit of hematite and magnetic iron ore. A letter regarding this ore says: "The quality, according to assays from the State Mineralogist, is unexcelled by any mine on the continent. The quantity in sight is sufficient to build a double-track railway around the globe."

An analysis of this ore from a Cleveland, Ohio, laboratory is as follows:

Iron	66.200
Silica	4.200
Phosphorus	.249
Manganese	.370
Alumina	.340
Lime	2.040
Magnesia	.022
Sulphur	.039
Organic and volatile matter	.240
Titanic acid	None.

Another hematite deposit at Los Banos, Merced Co., according to a Pittsburg assay shows 92 per cent. of ferric oxide.

Regarding "Hematite," "Magnetite," etc., it may be here parenthetically stated the following classification of iron ores from the *Iron World*, although it may be open to some technical criticism, is believed to be the best arrangement:

1. Red hematite comprises those ores in which the iron occurs as an anhydrous oxide, giving a red streak on a porcelain plate, the color of the ore being generally a brownish-red or red, although sometimes a dark gray, almost black. This class includes "red hematite," "fossil" or "Clinton" ores, "specular," "micaceous" ore, "slate" ore, etc., as well as some "martite," which is a pseudomorph after magnetite.

2. Brown hematite, which contains more water than the red hematite, is generally of a brown or yellow color, and when powdered shows a brown or brownish-yellow streak on the porcelain plate. The varieties are known as "limonite," "turgite," "pipe" ore, "bog" ore, "goethite," "oolitic" ore, etc.

3. Magnetic comprises those ores in which iron occurs as a magnetic oxide, generally black or blue-black, or occasionally steel-gray or greenish in color, and which when powdered gives a black streak on a test plate, and are attracted by a magnet. In this class is included some "martite," which is mined with magnetite.

4. Carbonate includes those iron ores which contain an excess of carbonic acid. They are generally gray, yellow, or rather buff and brown in color, and are tested by the use of hydrochloric acid. They comprise the "black band" ores, "clay ironstones," "spathic" ores, "siderite," etc.

From some mines, brown and red hematite, or red hematite and magnetite, or carbonate and brown hematite ores, are obtained out of the same workings, the extent to which ores are hydrated or weathered, transferring them from one class to another; or different classes of ore are found intermixed or alternating in the same deposit.

Chromic iron, shown by assay to contain 52 per cent chromic oxide, has been discovered on the Maillard ranch, San Geronimo township, Marin Co., about eight miles from San Rafael, and in the same locality iron and manganese are found in considerable quantities. A sample sent to the Bethlehem, Pennsylvania, Steel Works showed an assay of 46 per cent oxide of manganese, and brought an offer from that company of $30 a ton for the ore delivered at the works.

In Sonoma, Humboldt, Inyo, Placer, Napa, Tulare, Tehama, Shasta and Lake counties are also large known deposits of good iron ore.

One of the largest and in many ways the most remarkable of the iron deposits of this State or coast is in San Bernardino county, about 150 miles from Los Angeles, on the line of the Atlantic and Pacific railroad, described by Warren Wilson, who recently visited that locality. Leaving the railroad at Newberry, traveling thence six miles over a barren, level country, a narrow gorge in the mountains is reached, entering a lava bed on the northern boundary. The rocks in both walls of this place are serrated, sharp and angular, black as well as stained by the oxide of iron. The leading features of this remarkable body of ore are its vast extent, its richness and freedom from impurities, and the presence of several varieties of iron ore. The entrance of the defile is about 50 feet in width and 200 feet high, vertical in some places and in others inclined. Passing in from the entrance for about 400 feet a vast open space is reached, surrounded by rocks of the same character as those of the walls constituting the fissure or gorge. Thence in a southerly direction for five miles, volcanic rock, tufa and sandstones of volcanic materials are found. Reaching the summit, at an elevation of 3880 feet, all traces of volcanic character disappear. The rocks are granitic in character on the southern slope of the mountains and at its base, while at an altitude of 3025 feet is found the iron deposit referred to, about four miles from the summit. The veins of this deposit are well defined. They run for 20 degrees east, and dip into the hill northwest at an angle of about 30 degrees; the veins lie nearly parallel, separated by a deposit of 150 feet of syenite at a slight inclination. It is stated that the lower body of this ore is not only remarkably pure but magnetic. The upper vein of this ore lies at an altitude of 3205 feet, and in it are found hematite as well as magnetic ores, and another known as nut ore. It stretches 70 degrees

northwest, its northern wall being a regular belt of dolomite limestone, the southern wall being syenite. On these hills this vast body of iron ore averages 300 feet in width, and may be traced for a distance of three miles, with a valley intervening of about one mile in length, which has cut away the vein on the surface. It has been estimated that there are disclosed not less than 1,000,000 tons of ore. A great deal of development work has been done here, in all instances demonstrating the varied character of the veins. The work done thus far has cost about $10,000, including the expenses of patenting the claim named Bessemer No. 1.

The magnetic ore found here lies in heavy, compact masses of a deep iron color, with some luster, and with an occasional copper tint, that was at first suspected to indicate the presence of titanic acid. The iron ore is said to be highly magnetic. In several of those groups hematite predominates, such as is so largely in use in Europe for the manufacture of Bessemer, and Siemans-Martin steel, and by reason of it containing so small a quantity of phosphorus and sulphur, it would appear to be almost identical with the ores worked at Bavarian furnaces in Lancashire, England, also in the Westmoreland and Cumberland mines, and at Bilboa in Spain. Specular iron ore is also found in one or two of the claims, and spathic ore, or carbonate of iron, is also found in this remarkable group.

Concentrates.

THE Osborn Hill mine at Grass Valley has temporarily closed down.

A FIRE at Knights Ferry last Monday destroyed a large part of the town.

A $25,000 DIVIDEND is announced by the Three Forks, B. C., Concentrator Co.

A TEN-STAMP MILL is to be put up at the North Star mine, above Enterprise, Butte Co.

COLORADO MEN are examining the St. John mine, near Grass Valley, with a view to purchase.

THE new 20-stamp mill at the Mayflower, near Canada Hill, Nevada Co., started up last Tuesday.

THE Zirn mine at Pine Nut, near Carson, Nev., is reported sold for $50,000 to a New York syndicate.

THE August gold output in the Witwatersrand (South Africa) district aggregates 203,573 ounces.

AT Quesnelle Forks, B. C., the Cariboo mine is running sixteen hours a day with 2000 inches of water.

A SOUTH AFRICAN MINERS' ASSOCIATION is now proposed at Johannesburg. Next in order will be a Miners' Union.

F. DESELVE was instantly killed at La Grange, Merced Co., last Tuesday, while at work in the Speaker drift mine, by a cave.

HOLDERS of unpatented claims have 90 days left in which to perform the required $100 of work or improvements for this year.

THE annual statement of the Merced Gold Mining Co. shows capital stock $1,500,000; actually paid in, $1,000,000; existing indebtedness, $27,287.29.

THE Denver *Republican* says the cost of mining both gold and silver in Colorado now is fully 30 per cent. below the figures for 1893 before the panic.

AT Wardner, Idaho, the Last Chance mine is again in operation and is daily shipping 55 tons of ore, with a total force of eighty-two men in mine and mill.

The annual statement of the Butte & Boston Mining Company shows the capital stock of the company $5,000,000, all paid in, and the indebtedness $2,394,238.38.

OVER twenty tons of pumping machinery from the Grand Prize mine at Tuscarora, Nevada, is being shipped to G. W. Grayson's mine near Baker City, Oregon.

ESTIMATES have been asked for the erection of a sixty-ton concentrator on the Washington mine in the Slocan district, B. C., and the building of a tramway 1500 feet long.

COMPETENT judges estimate that there are about 3300 stamps in present operation in this State. In the one district of Witwatersrand, South Africa, there are nearly 3000.

SPECIMENS of quartz ore from the Pennsylvania mine, Nevada Co., have been bought by J. V. Bretonnel of this city at $15 per pound for use in the manufacture of jewelry.

THE De Lamar, Nevada, August output shows: Tons crushed, 3618; bullion realized, $75,227.53; ore shipped, 550S; total revenue, $81,227.53; expenses, $41,668.33; profits, $39,559.20.

IN the suit of Fox vs. the Hale & Norcross Mining Co., Judge Hebbard has fixed October 21st as the date when he will hear evidence on which is to be based final judgment.

MR. W. S. CATES of Colfax, Wash., has bought the Baisley-Elkhorn mine, near Baker City, Or., for $31,000 cash, and expects to expend considerable money in developing the property.

MAJOR FRANK MCLAUGHLIN has taken hold of the Rock River mine at Oregon Gulch, Butte Co., appointed Geo. Fequa superintendent, who with a force of men will reopen and develop the mine.

THOS. LOVEJOY is under arrest at San Andreas, charged with obtaining money under false pretenses. He fixed up some quartz with gold paint, told G. Everson the specimens were easily worth $1000 and got $350 from him.

A SILVER NUGGET is reported discovered near Richmond Basin, Arizona, weighing 393¼ pounds. The size is phenomenal and its apparent purity excites comment. It is about 12½ inches long and reported to be almost pure silver.

THE Kinkead Mining and Milling Co. expects to get to work in the next thirty days on the old dumps of the Con. Va. mine. If the process is found to be at all profitable, considerable of the same kind of work will be done in that locality.

THE Homestead mine, near Gold Lake, Sierra county, has permission to operate that mine by the hydraulic process. The Debris Commissioners also issued permits this week to build dams at the Canada and Argentine mines in Sierra county.

THE managing owner of the Rawhide mine, Tuolumne county, says the August gold output of the mine was $87,000, and that the property is not for sale. When the new stamps are ready he expects to make and maintain the monthly output $100,000.

THE New Era Mining Co., which recently put a boat and dredger on the Yuba near Brown's Valley is to add a large pump, when it is expected water will be secured in sufficient quantity to wash the material raised by the buckets from the bed of the stream.

AT the Broken Hill Proprietary (Australia), for the week ending September 5th, 6408 tons of ore were treated, yielding 646 tons of lead, containing 119,777 ounces silver; also 1788 tons treated by amalgamating and leaching plants, producing 30,468 ounces silver.

THE Montana Ore Purchasing Co. has recently declared a dividend of $1 per share, aggregating $70,000. The output of the works this year is estimated at 16,000,000 pounds, which at 12 cents per pound will yield $1,920,000 to the management, of which $1,000,000 is for labor and supplies.

T. S. JOHNSON of this city is credited with a discovery of great value in a practical method of separating the gold from the abundant magnetic black sand on the beach line from Alaska to Chile—a problem that has engaged the unsuccessful attention of many metallurgists for many years.

THE S. P. Co. will give a one and one-third round-trip rate to delegates attending the convention of the State Miners' Association in this city on the 14th of next month. That is, for one and one-third times the regular fare one way a round-trip ticket will be issued from any station on the company's lines.

THE name of Robt. McMurray is prominently mentioned in connection with the presidency of the Cal. State Miners' Association. The name of Julian Sonntag is also favorably mentioned regarding the secretaryship. In case Messrs. Neff and Ralston decline re-election, it is thought that the interests of the association would not suffer at the hands of these gentlemen.

AN action was begun last week by the County of Yuba against J. F. Cowdery, Donahoe, Hayes and a number of other defendants to restrain them from mining by the hydraulic process at a place called St. Louis and discharging the debris from their mines into Slate creek, which creek empties into the Yuba river. The complaint is signed by Robert T. Devlin, attorney for the State Anti-Debris Association.

DESPITE the roseate announcements of the early summer, the Meadow Lake ores are still unworked. A correspondent, discussing matters and things, says it is wrong for this paper to use the word "rebellious" in speaking of any ore. Probably it is; but in the case of the irreducible, contumacious, refractory and insubordinate character of the Meadow Lake ore, the word "rebellious" seems to have an animate descriptive fitness.

THE July report of the Robinson Gold Mining Co., South Africa, shows: Stamps at work, 70; net running time, 30 days; tons crushed, 9700; tons per stamp per diem, 4.6; gold won from above, 9874 ozs. 14 dwts. Chlorination and cyanide works—Gold from concentrates, 1319 ozs.; bullion from tailings, 1579 ozs. 15 dwts.; from own ore, 12,773 ozs. 9 dwts.; gold from concentrates purchased, 2050 ozs. 16 dwts.; total, 14,824 ozs. 5 dwts. Profit for month, £32,719 9s. 6d.

THE Shasta *Free Press* says "there is here a gentleman named Walter de Varila, whose headquarters are in San Francisco, and who states that he is in search of mining property. He wants to buy three mines, and his backers are willing to expend all the way from $100,000 to $500,000." Similar items are observed in other papers; it is to be noted that developed mines are in demand, but an undeveloped claim has no better chance for sale now than it ever had.

THE third annual report of the Colorado Fuel and Iron Company, of Pueblo, Colo., for the fiscal year ending June 30, 1895, shows that the gross earnings for the year were $5,667,185, as compared with $4,375,474 for the preceding twelve months. The company earned all its fixed charges, paid a dividend of eight per cent on $2,000,000 of preferred stock, and at the end of a year had a surplus of $48,674. The net earnings were $804,229, an increase of $143,464 over the preceding year.

THE Live Yankee Gravel Mining Company, with the location of works and the principal place of business at Graniteville, Nevada Co., has incorporated; capital stock $25,000: $1 par value. Subscribers—W. McLean, 4000 shares; W. Mobley, 2000 shares, and the following named 1000 shares each: G. A. Stinger, P. S. Waldron, H. Dundon, E. W. Foss, D. King, E. O'Brien, R. Monteith, A. Monteith, O. Penrose, W. Foss, W. Kallenberger, F. Cummings, T. C. McGagin, J. Derre.

THE Australian Smelting Company, with a capital of £500,000, has bought 500 acres of land at Lake Illawarra and will build a smelter. The process is an electrical one. It is expected that 1500 tons per day will be treated. The raising of the money for the construction of the harbor at Lake Illawarra has been undertaken, and it is expected that the work will be completed within three years. John Howell, whose statement appeared in last week's issue, is managing director.

THE London *Times* of August 25th says: "The minds of all English mining men appear to be so engrossed in South African ventures at present that they will pay no attention to anything else. One of the most deplorable results of this is that they are allowing the first fruits of perhaps one of the richest mining fields in the Empire to be reaped by aliens—nay more, they are allowing a province of Canada to become American in men, manners, money and sentiment. As long as British Columbia was only known as a silver field, this was comprehensible, although our silver deposits have now proved themselves rich enough to pay, with silver even lower than it is at present. But since last year a gold-bearing belt of ore has been discovered and opened up which, added to our gold-bearing gravels, seems likely to give British Columbia a prominent place among the gold-producing areas of the world."

ONE HUNDRED AND FIFTY MEN have been put to work on the foundation for the Parrot Company's new million-dollar smelter at Gaylord, Montana. Some of the men are excavating, while the rest are working on the foundation walls. Large boarding-houses are now in course of erection at the new town to take the place of the tents, which have served as temporary quarters for the men, and it is the company's expectation to have 300 men at work there before the end of the month.

THE "boom" in gold mines appears to have struck Spring City, Tennessee, from which place is received a letter desiring the PRESS to purchase stock "in some good, reliable California gold mine." The writer limits the matter somewhat by the statement that he would be "willing to pay one or two cents per share," though he "might pay more if necessary." He desires the names and addresses of paying stock companies desirous to part with their holdings at the prices named.

THE Bureau of Statistics of the Treasury Department reports that gold to the value of $16,667,261 was exported during August, making $55,766,217 for the eight months of the year. The excess of exports over imports is placed at $15,159,582 and $27,702,341 as opposed to $1,915,303 and $54,233,281 for the corresponding period of 1894. Gold ore showed a total export for the eight months of over a million.

THE bonding of the Desert Queen mine, San Bernardino Co., has brought considerable to the surface. The Baker Iron Works of Los Angeles has attached for $2110 due for supplies, one G. W. Myers has sued for a third interest, alleging that he prospected the claim with the two McHaneys and that it was to be share and share alike. A convict named Chas. Marshall, under present sentence of death, claims a fourth interest on precisely the same claim as Myers, and at present the prospect is bright for the mining lawyers of that vicinity.

SECRETARY CARLISLE has rejected the proposals submitted for assaying and sampling ores on the northern and southern borders of the United States, to ascertain the percentage of lead contained therein, and takes the position that it is impossible to carry out the intent of Congress when bids for doing only part of the work are submitted. He thinks that the work can be done cheaper by the government, and will ask Congress for an appropriation sufficient to establish ore sampling works at the principal ore importing points along the Mexican and Canadian borders.

SAYS the Butte *Inter-Mountain*: The Anaconda Company paid out for wages in Butte last week $212,000. This means that the mining payroll of the company numbers about 2120 men, or about one-half the total force of miners employed in the district. At the Anaconda smelter the wages disbursements were about the same, and a large part of the money found its way to Butte. The wages paid at the lumber camps and sawmills swell the total to about half a million dollars, or at the rate of $6,000,000 per year for the Anaconda Company alone. These figures need no elaboration. No other mining company in the world has such a payroll.

THERE is a large amount of money invested in a diamond drilling plant. The value of the diamonds used is $20 per carat, an increase of $4 over last year. This increase, it is understood, is due to the recent demand for diamonds in South Africa, where extensive drilling operations are being pushed forward. No less than fifteen drills have been lately shipped to the Johannesburg field, and more are on the way. Every hit is fitted with from $400 to $500 of the little black stones, and as there are two hits necessary in the putting down of a hole, the cost for diamonds alone is in the neighborhood of $1000. These little jewels rapidly wear out, the loss in this item alone being about 50 cents a foot.

DURING the last ten days the following mining companies have incorporated in the State of Washington: Gold Hill Mining Company, Spokane: capital $500,000: incorporators, R. T. Daniels, T. B. Jones, M. Doneen, N. B. Buckler, J. W. Winthrop, R. M. McLean, John A. Currie. Post Falls Woolen Mills Company, Spokane: capital $10,000; incorporators, E. Denzel, R. Came, W. H. Came, F. E. Denzel. You Like Mining Company, Spokane: capital $1,000,000; incorporators, John S. Baker, H. W. Baker, J. H. Boyd and W. J. C. Wakefield. Giant Mining Company, Spokane: capital $500,000: incorporators, W. J. C. Wakefield, J. H. Boyd, H. W. Baker, J. S. Baker. Evening Star Mining Company, Spokane; capital $1,000,000; incorporators, D. M. Drumhiller, F. P. Hogan, S. S. Bailey and others.

MENTION was made on the 7th inst. of an agreement said to have been entered into between Jas. R. Morse of this city and the King of Corea, wherein for his services the former was granted extraordinary concessions by the latter in the development of Corea's mineral resources, alleged to be very rich. Renewed interest is felt in the matter by the departure on the Coptic of A. W. Deshler of Detroit and J. K. Eveleth of London, two mining engineers who are credited with being secret envoys from rival syndicates, each with the same purpose—to inspect and investigate Corean mines with a view to resultant business. It is understood, however, that the royal arrangement with Morse is largely in the nature of an exclusive franchise, though on this latter point advices from Clarence Greathouse would be of present interest.

J. C. CRAMER and D. G. Silliman, two Montana mining men, who went to Cook inlet via Kodiak and Yakutat, with the intention of extracting gold from the ocean beaches, report failure in finding gold in paying quantities, to the Alaska *Record*. "They thoroughly prospected miles and miles of shore along Black Sand island and a score of other places said to contain gold-bearing sands, but 14 cents to the ton was the highest amount taken from any one place, at which figure nothing could be made excepting where an enormous number of tons could be handled. They found the country entirely unsuited to the production of the yellow metal, and expressed the opinion that the gold found in that neighborhood was deposited by glacial action and brought from far in the interior. They prospected for miles back of Cook inlet for quartz ledges and any other formation liable to contain gold, but failed to find the least indication that the country in the immediate vicinity was such a country that would produce gold, except as spoken of—by being brought from the interior—and is extremely fine or flour gold. The party originally consisted of six men and was provisioned for thirty months."

Alcatraz Asphalt.

(Continued from page 197.)

a chemical union, it is a tough elastic cement, which is barreled and sent abroad. When used it is mixed with the requisite quantity of sand and applied in the usual manner of constructing asphalt street pavement.

Though handicapped by distance and consequent high rates, the merits of this California-made asphalt have given it ready and increasing sale in Denver, Omaha, and as far east as Syracuse, New York City and Brooklyn, N. Y. In the past few months sufficient has been sent by rail and ocean to pave ten miles of city streets, and wherever used it is its own best advertisement. The enterprise is distinctively Californian; it has the world for a market, and stands solely on its merits as a desirable material for street paving. It illustrates one of our mineral resources partially developed, and as such the MINING AND SCIENTIFIC PRESS has deemed it worthy of illustrated notice.

FIG. 3.—ALCATRAZ REFINERY AT LAS CONCHAS MINE, LOOKING WEST. (See page 197.)

Crushing the Apprentice.

Some men wonder, as does a friend of mine, why it is that they constantly have to be training up new men and apprentices, and that the moment they know anything they up and quit.

The reason for this most aggravating state of things is, happily, not always that which sends my friend's apprentices from him, viz., crossness and brutal ridicule. I happened in his shop just when my friend was directing his bright young apprentice how to do a very simple piece of lathe work. "Now, I wonder," said he to the trembling youth, "if you know enough to do this just as I will show you?" The he showed him every movement; just how to hold the wrench, and pull the belt, and pick up and put down the piece, saying all the time: "See how easily and swiftly I do it. If you know anything you can do it just as fast and perfectly. Now try it." Thus encouraged (?) the boy started in, and, of course, did not make just the same movements as the boss. "No, no; you confounded idiot, didn't I tell you that wasn't the way? Can't you see that I take the wrench in this hand? Now, let me see if you know enough to do as you are shown. Come, hurry up; I can't waste my precious time teaching a blockhead and then"—turning to me—"have him leave me as soon as he comes to know anything."

The poor boy, sweating at every pore and trembling in every limb, and fearing to make a move lest it should be a false one that should call forth another torrent of abuse, made another and very skillful attempt, while his tormentor, turning to me, pleasantly (?) remarked: "None but d——d fools, I believe, try to learn the machinist's trade."

And, yet, my friend is one of the finest and most ingenious machinists that I know. From a mechanical point of view it is as great a treat to visit his shop as it is distressing to witness his brutal and degrading treatment of his help. No wonder he is constantly compelled to break in new help, for his breaking-in houses every latent evil passion in the breast of the learner and the moment he has caught a smattering of the really fine training he is getting he leaves for a more congenial shop, one where he will not be jumped on every moment by the boss.

Could anything be more shortsighted than such treatment, breaking up the spirit while training the hand, as though one could live and bud into success without the assistance of the other. Apprentices even are human beings, and real genius may be driven into despair if met at the threshold of development by ridicule, belittlement and condemnation.—Lapis, in the Age of Steel.

FIG. 4.—PORTION OF LAS CONCHAS MINE, LOOKING EAST. (See page 197.)

Some Legal Points.

An outlawed debt still holds the debtor under moral obligation, but no court can compel its payment.

A stockholder's right of action to compel delivery of his stock does not accrue till his right to same is denied.

Where an action is in itself unlawful, the law will presume a criminal intent from the intentional commission of the act.

One is not guilty of negligence unless he omits to do something which a reasonable man would do, or does something which a reasonable man would not do.

A clause written across the face of a contract is presumably the last expression of the agreement of the parties, and the one most in mind at the time of its execution.

When a stranger to a recorded title enters into possession of land, his entry is assumed to be hostile to the real owner, and his possession is the continued assertion of an adverse right.

Numerous adjudications demonstrate that

FIG. 5.—ALCATRAZ ROCK ASPHALT IN TUNNEL AT 125-FOOT LEVEL. (See page 197.)

business cannot lawfully be conducted upon the public streets, and that the constant placing out of show cases for the exhibition and sale of goods is unauthorized and illegal.

The declarations of one in disparagement of the title he had once held to land, made after he had parted with the title and when he was not in possession, are inadmissible to affect those holding under him.

After knowledge of defects which may render the employment dangerous, unless the damage is imminent and obvious, the servant may continue in his employment a reasonable time, in reliance upon a promise of the master to repair.

When an indebtedness consists of principal and interest and a payment is made by the debtor, which is not applied by him or the creditor to any part of the indebtedness, the law applies the payment first to satisfy the interest, and then the principal.

An officer forfeits the protection which the proper execution of legal process affords, and becomes a trespasser from the beginning, when he is guilty of such an improper and illegal exercise of authority under it as warrants the conclusion that he intended from the first to use his legal authority as a cover for his illegal conduct.

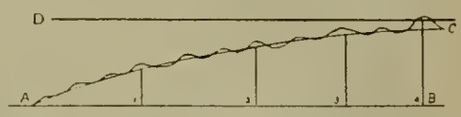
It is the invariable rule, well understood by the profession, that an opinion of a court of last resort becomes authority only upon the point decided, and that its opinions upon other points are of no binding force or effect—indeed, that such passing declarations have no weight whatever, except such as the cogency of the reasoning may entitle them to.

An electrical engineer finds the relative quantity of heat given off by different forms of light to be: Arc light, 4; incandescent, 14; kerosene, argand burner, 331; gas, argand burner, 380; candle, 473; gas, butterfly burner, 511. In the matter of vitiating the air, electricity of course compares even more favorably with other sources of light.

Critical Periods in the History of the Earth.*

NUMBER V.

By JOSEPH LE CONTE, of the University of California.



PROGRESSIVE CHANGES IN SUCCESSIVE CRITICAL PERIODS.

It may be interesting to compare the successive critical periods with one another and show in them also progressive change or evolution.

1. Critical periods have gradually become shorter, the changes in physical geography less and less, and therefore the changes in organic forms, in so far as they are connected with these latter, also less and less. The shortest in duration, the least in geographical changes and the least complete and sweeping in changes of organic forms is the last. It is for this reason that it is not usually recognized. But this is exactly what we ought to expect from a comprehensive survey of the whole history of the earth, i. e., from the point of view of evolution.

2. But on the other hand the effect of the introduction of new dominant types in the whole organic kingdom has been steadily increasing. It was great in the introduction of the great reptiles, much greater in the introduction of man. Thus this last critical period is not a whit behind the other in importance, and therefore deserves no less than the others to be used as separating Primary Divisions of Time.

3. The oscillations of temperature characteristic of critical periods have probably gradually increased with the course of time. Local oscillations of temperature doubtless occurred frequently. At critical periods they were both greater and more general, but I suppose that glacial conditions at sea level in middle latitude regions was reached but once, viz., in the last. This is illustrated by the accompanying figure, in which the abscissa A B represents the course of time, the ordinates the degrees of cold, and the height of the line D E represents such a degree of cold as is necessary to produce glacial conditions at sea level in middle latitudes. The gradual rise of the line of cold, A C, represents the gradual cooling of the earth surface, whether by secular cooling or by decrease of carbonic acid and water in the atmosphere, or by both; and the waving of the line, the oscillations of temperature. The numerals 1, 2, 3, 4, are the times of revolution or critical periods marked by greater and more general oscillations, the smaller intervening waves being the more local oscillations. It is seen that only once, i. e., during the last critical period, partly by increased general refrigeration, but mainly by a concurrence of causes, geographical and astronomical, true glacial conditions (represented by the line D E) were reached.

Critical periods, as already said, are of long duration and changes during such times are not simultaneous everywhere, but rather propagated from place to place. This is especially true of the changes in organic forms. These are propagated by a wave of migration which may extend far beyond the limits of the physical changes. Therefore the time of greatest change in organic forms may not be exactly synchronous everywhere. This fact gives sufficient room for the application of Homotaxis.

GENERAL FORMAL LAWS OF THE EVOLUTION OF THE ORGANIC KINGDOM.

We may now profitably sum up the general formal laws, or the general process, of the evolution of forms; for it is these more than aught else which determine the divisions of time, both primary and secondary.

General Advance by all Factors.—Let us imagine then, first, a steady advance of the whole organic kingdom, everywhere and all along the line, under the operation of all the factors of evolution known and unknown, whatever these may be. If this were all these would be successive geological, but no simultaneous geographical, faunas and floras. Organic forms would change in time but not differentiate in space. The determination of synchronism or of a geological horizon in different continents, would be easy because the identity of fossil forms of the same time in all parts of the earth would be absolute. A chronology of the earth would be easy to construct because it would be the same everywhere. There would be everywhere but reprints of the same history. This is one extreme, but we know it is far from the real truth.

Origin and Increase of Geographical Diversity.—Different conditions in different places isolated from one another by barriers, physical, climatic, or both, and therefore without mixture of species by migration, give rise to different rates or directions of advance and therefore to divergence of geographical faunas and floras, which increases without limit with time. If this were all, there would long ere this have come about an extreme diversity of geographical faunas and floras; more extreme than any we now know. Indeed, so extreme that determination of synchronism of strata of different places by comparison of their fossils would be impossible. The geological history of each country must be studied for itself. There could be no general history of the earth and no general classification of the strata. This is the other extreme; but neither is this true.

Critical Periods Diminish Geographical Diversities.—But from time to time, at great intervals, there occur critical periods, i. e., periods of great and widespread changes in physical geography, and therefore of climate, and therefore, also, in organic forms. These latter changes, as already explained, are determined partly by the pressure of a changed environment and partly by wide migrations—both permitted by removal of barriers and enforced by changes of climate—and the consequent mixing of faunas and floras previously separated, the severer struggle consequent thereon and more rapid rate of evolutionary changes. In connection with the new conditions, the severer struggle and more rapid evolution, there would arise at these times new and higher dominant types which would still farther increase the change of organic forms by compelling a new adjustment of the whole organic kingdom. This is especially true of the effect of the appearance of man.

The effect of all this would be to hasten the steps of evolution and increase organic diversity. These critical periods form the lines which delimit the primary divisions of history.

(To be Continued.)

* Bulletin No. 11, of the Department of Geology.

FIG. 7.—ORE DUMP OF ALCATRAZ ROCK ASPHALT AT MINE. (See page 197.)

Mining Summary.

CALIFORNIA.

Amador.

A DIAMOND DRILL.—*Republican:* The Alma has a diamond drill for prospecting operations, which was brought up the latter part of last week with two experts to get it in running order. The drill was started in the east crosscut Monday. In eight hours it drilled 30 feet, and in four hours on Tuesday it passed through 20 feet of black slate. This is prospecting at a lively rate in comparison with the slow process of tunneling. The drill takes out a core nearly an inch in diameter. The miners have been temporarily laid off, to await the result of drilling operations.

Calaveras.

SUDDEN RISE IN THE STANISLAUS.—At the Navis claim on the Stanislaus river, last week's sudden rise in the river—five feet, washed away their wheel and other improvements, one of those occurrences that sometimes take place in the mountains in the latter part of summer at almost a moment's notice—a cloudburst. Twenty thousand inches of water entered the water company's flume one morning last week from this cause and the following morning this had dwindled down to 600 inches.

Messrs. Horswell are testing with the cyanide process tailings on the old Calaveras mine property.

SUCCESSFUL.—*Citizen:* L. Ricard's invention of a machine that would meet the requirements of tunneling through gravel and cutting away quartz is being operated at the old Osborn mine about a mile south of Altaville.

THE CRYSTAL MINE.—The Crystal mine is to be opened immediately. This is the property recently negotiated for by Mr. Butts with Messrs. Hardy and Osborn. A force of sixteen men is to be put on in a few days.

THE BANNER GRAVEL MINE.—The Banner gravel mine bouders have an eight-stamp mill with a crushing capacity of eighty to a hundred tons of gravel per day. The shaft is ninety-five feet deep and drifts are being run.

El Dorado.

THE BLUE GOUGE BONDED.—*Democrat:* Upon a favorable report by their expert, the Blue Gouge mine, just south of Sly Park, has been bonded to John W. Mackay and E. A. Head. They will commence experimental workings without delay, and if they shall verify the report as to the extent and value of the mine the bonding millionaires will put up the largest milling plant in the county. Messrs. Bind and Reeg step down and out to give the bondholders and their money a chance.

Bishop & Co. are putting up a 10-stamp mill near Henry's.

Merced.

AT LA GRANGE.—*Star:* Placer mining above La Grange is attracting considerable attention in that section and a great deal of work is being done. A number of farmers are prospecting in the river bed, in old gravel mining grounds, realizing from $1.50 to $2.50 per day. Modern appliances are being used as the gold is very fine and hard to save.

The new mill at the Horseshoe mine in Hunter's valley was started up last week and everything worked like a charm. It is the intention of the owners to make a three weeks' run on the rock before cleaning up.

Nevada.

BOUGHT BY A SCOTCH COMPANY.—*Transcript:* It is a Glasgow company that purchased the Trevaskis mine. The company will be known as the Red Hill Limited Mining Company. Captain Pryor, the company's representative, who arrived here a few days ago, has had preliminary work started to determine the best point at which to begin active operations. When this is accomplished the company will put up machinery and proceed to develop the property in a practical and scientific manner.

SOLD THEIR MINE. — *Transcript:* Colonel Callahan has purchased the mine lately owned by Thomas, Ott, Schmidt an others, on Sweetland creek, in Bridgeport township. The claim is an extension of the Boss mine, and is regarded as a valuable property.

HAS NOT CLOSED DOWN — The English Mountain mine at Graniteville has not closed down. The mine is running full hlast, and is likely to continue. Work is being prosecuted on three levels. The ore bins contain over 500 tons of quartz, and twenty stamps are kept running day and uigbt.

Placer.

WILL HELP OPHIR.—*Republican:* The Selby Smelting and Lead Company, of San Francisco, are offering to treat quartz ores containing less than $50 valuation for $10 per ton. This figure does not apply to less than carload lots. At this low price for treatment a miner having ore containing $20 per ton or over can realize a good margin on it, as $14 at the most will cover the charges for smelting and transportation. The railroad company has made a rate of $2.60 per ton per carload from Auburn, and a $2.40 rate from Newcastle. This is a boom to the Ophir miners, as there is plenty of $20 rock in the district. Heretofore the miners could not work their claims on account of the rebellious nature of the ore when milled, hut the radical cut made in treating it by the Selby Company lends encouragement to miners with refractory ore to go ahead and develop their property. The Selby Company make assays as soon as the ore is received and within less than a week returns are made to the shippers.

Siskiyou.

F. C. Mathyas, representative of the California State Mining Bureau, has been investigating the mines of Siskiyou. He reports a company at work a short distance below the mouth of the Salmon, putting in a wing dam to turn the Klamath, so as to mine the bed of the river, which is supposed to he very rich. They have at present about forty men employed and are rushing the work, as they will be unable to do anything after the first rains, which will raise the river and carry away the dam and other appliances. In the neighborhood of $6,000 has already been spent in preparation. Before operations were begun there were 15 feet of water and 8 feet of gravel to be overcome before bedrock could be reached where the gold is generally found.

Mr. Mathyas will now make an investigation of the mineral resources, including copper, chrome and beach mines of Del Norte. The result of his investigations will be published in the report of the Mining Bureau. This is the first representative of the Bureau to personally visit that county.

SPOT CASH WANTED.—W. P. Bennett, of the Forks of Salmon, who has been in Yreka for several days past, has been communicating with a San Francisco mining syndicate, desirous of purchasing his hydraulic mines at Forks of Salmon. The price agreed upon is $100,000, and the San Francisco men want to pay $50,000 cash down, with time for balance, but Mr. Bennett wants spot cash.

Plumas.

AT GRIZZLY MOUNTAIN.—*Independent:* Dr. P. H. Dow, manager of a mining syndicate formed at San Jose with a heavy capital to invest in the purchase and operation of Plumas county mines, was in town several days ago, and now is examining a mining property in the Grizzly mountain range, in which the syndicate is interested.

Shasta.

WORK SUSPENDED.—Work on the mill and mine of the Eureka Tellurium Company at Middle Creek is suspended and all the men employed discharged. The closing down is thought to be only temporarily.

MORE MEN.—The Iron Mountain Mining Company are putting on more men all the time and have made arrangements for 100 extra men.

MOUNTAIN MINES CO., LTD.—On the Iron Mountain Railway, about 400 men are employed along the route, which extends thirteen miles through a rocky country on Spring creek. The men are paid $1.75 per day; board is $4.50 per week. The smelting plant is to be built two miles from Shasta, near the line of the Southern Pacific Railroad Company. The Southern Pacific is building a spur to run from their road to the smelter, while the mine owners are pushing the road from the smelter to the mine.

E. Durfor has completed a contract on a tunnel on the Hornet mine, recently purchased by the company, located two miles from the Lost Confidence mine, on the other side of Iron mountain on Boulder creek, in the same range. There are two tunnels—one is in 112 feet without ore; the other, lower down, runs in from the creek a distance of 130 feet in ore.

Sierra.

A GOOD CLEANUP.—*Messenger:* The cleanup at the Bald Mountain Extension mine during the last two weeks bas been over $6,500.

Trinity.

THE NIAGARA MINE.—*Journal:* Auother rich strike was made in the Niagara mine last week. Two shifts are now employed and the mine is being run to its fullest capacity.

Tuolumne.

ACTIVE OPERATION.—At the App Heslep mine the new 40-stamp mill is nearly completed. The shaft is being enlarged to three compartments as far down as the 800-foot level. Three electric hoists are being erected on the three shafts of Miller and Holmes mine. At the Golden Rule E. A. Steut is putting down a 500-foot shaft.

NEVADA.

GOLD HILL MINES.—The weekly reports of the Gold Hill mines are as follows: Con. Imperial—No. 1 crosscut west is now out from surface tunnel 40 feet, 14 feet having been added during the week. The face is in porphyry and quartz of no value.

Crown Point—The water in the Carson river having raised sufficiently to furnish a power to permit of the Mexican mill running full, and the mill having started on the 20th inst., work was resumed in the mine on the 21st. The west crosscut on the 600-foot level has been extended 11 feet, and is now out 91 feet; in porphyry where it has been stoped. The west crosscut on the 700-foot level, opposite No. 2 east crosscut, is out a total distance of 24 feet, the face being in porphyry with clay slips through it. The stopes present no important change. Going south on the fifth and sixth floors, the quartz has been most entirely cut out by clay, which is raising in the face as they continue in that direction. From that floor to the twelfth the quartz is from 8 to 12 feet wide and will assay from $8 to $12 per ton, principally gold. During the week they have shipped to the Mexican mill, for reduction, 300 tons of gold ore, the average battery sample of which was $9.47, of which $8.47 was gold.

Belcher--Hoisted 20 tons of ore; average assay of car samples, $21.32 per ton. The 300 joint west crosscut has been extended during the week 19 feet. The face of drift is in porphyry. Have suspended operations in the mine for a few days to make necessary repairs.

Seg. Belcher.—Hoisted during the week 15 tons of ore, average assay $18.35. The 300 west crosscut has been extended 19 feet; face in porphyry.

The Confidence official letter says: Extracted 22 tons of ore during the week ending to-day. Average assay of ore samples was $38.22 per ton. No. 1 crosscut west is now 140 feet in the surface tunnel, 18 feet having been added during the week. From the west drift from the top of the upraise we have passed through the ore into what seems to be broken ground.

MORGAN MILL RETURNS.—The official returns of the ore worked and bullion produced at the Morgan mill for account of the Con. Cal. & Va. mine for the month of September are as follows: Ore worked, 1118 tons and 660 pounds. Bullion produced, gross assay value, $26,136.50, of which $11,718.70 was gold and $14,417.80 was silver. Yield in bullion per ton—gold, $10.47, and silver, $12.89; total, $23.37. Assay value of the ore per ton, per battery samples—gold, $10.51, and silver, $16.99; total, $27.51. Assay value of the above ore per ton, per railroad car samples, $32.93.

LANDER COUNTY.

A NEW MILL. — The Cleveland Gold and Silver Mining Co. has received two carloads of lumber and a large quantity of mining and milling machinery. Jan. 1st a reduction plant will be in operation on ore from the Cleveland mine, which is situated on the west side of Smoky valley, forty-five miles south of Austin. Mr. Byron is president and general manager of the company; J. F. Packer is the superintendent who will have charge.

OREGON.

The steam shovel recently put in by Grant Brothers, the Utah capitalists, for working the flat ground near Granite, has made a trial run in cement and boulders, and is a success. The ground is six to nine feet deep, and the shovel, which operates with a crane, will cut a swath about 40 feet wide and elevate the gravel about 20 feet, dumping it in sluices. Capacity, 3000 yards in 24 hours.

BRITISH COLUMBIA.

THE SMELTER. — Rossland *Miner:* Messrs. Anderson & Costello, who have secured the contract for the Trail smelter, call for 300 men. Ground was broken for the plant yesterday and everybody at Trail is happy. Subcontracts have been let for 2,500 cords of wood and for all the excavation work.

Nelson *Tribune:* The contractors who are to build the smelter at Trail are on the ground, and are asking sub-contractors to tender for 1,500,000 feet of lumber, 1,500,000 brick, 10,000 cords of wood, two miles of flume, and for excavation and masonry work. A certificate of incorporation has been issued Mr. Humphrey and his associates for a tramway from Trail to the Iron Horse mine near Rossland.

ON THE FRAZER.—Asheraft *Journal:* Geo. T. Gardner and associates of Seattle, Wash., are putting a hydraulic on the Frazer about four miles below Spuzzum on the opposite side of the river. The company are building about 7200 feet of flume of size 2x3 to carry water into the mine. They will soon have the pipe and machinery on the ground and expect to have it in operation in about sixty days.

THE UNDERWOOD DREDGER.—Colonel Underwood is purchasing hardware and iron work for his mammoth dredger; a mill at Quesnelle is cutting the required 100,000 feet of lumber. The scow will be built near the bridge at the mouth of Quesnelle, the cost will be about $35,000. He expects to have it completed and at work within the next four months.

AROUND ROSSLAND.—Rossland reports say the present payroll is estimated at $30,000 a month but commencing Nov. 1st, it is expected to increase to $75,000. This estimate is based on the proportion of 125 men to the War Eagle, 100 to the Le Roi, twenty-five to the Josie, Crown Point, Iron Horse, Nickle Plate, Center Star, Columbia and Kootenay and from ten to three men on the other claims that will be worked through the winter. The Cliff if it works this winter will employ at least twenty men. This property has a tunnel in $30 ore and owners recently refused $155,000 for the property.

Three expensive plants have been ordered. The first to arrive will be a large air compressor, boilers and engine for the War Eagle mine. The Center Star and R. E. Lee have ordered similar plants.

THE LE ROI.—*Review:* At a meeting of the directors of the Le Roi Mining Company a dividend was delared of $25,000, or five cents per share. George Turner, who has lately directed the active management of the company's property, resigned from the presidency to take the position of general manager, and his brother, W. W. D. Turner, was elected president in his place.

Nearly four-fifths of the 500,000 shares of the Le Roi are held in Spokane, about 100,000 shares being owned in Danville, Ill.

The company is shipping 3000 tons per month. It pays for freight charges and treatment $14.50 per ton, but has a contract with Heinze, Breen and others who are building the 100-ton matteing plant at Trail Landing, under which they are to take the ore at the bins after October 1 and treat it for $11 per ton. In view of the near approach of this more advantageous arrangement, the company will not make such extensive shipments to the other smelters for the next two weeks.

Most of the ore is now going to the Everett smelter. Two hundred tons have just been shipped to Deadwood, to be used in an experiment with the ores there, and some has also been shipped to Tacoma. The ore is in sharp demand by the smelters because of its heavy percentage of iron.

ALASKA.

NO PLACE FOR TENDERFEET.—In the Yukon district the manner of mining is novel. As the ground is frozen the year round, it is cut during the spring, fall and summer months and thawed out by fire in winter, to be sifted for gold which may be in it, by the placer process. Access to the mines is not very difficult, although they are situated over 700 miles from Juneau, but the trip is necessarily expensive when the amount of food to be consumed is taken into consideration. In order to even attempt the trip a man should have at the very least $500 at his disposal.

IDAHO.

CLOSED DOWN.—The Tiger mine at Burke closed down on the 19th, throwing 125 men out of employment. The management states that the shutting down is for an indefinite period, and that nothing will be done except a little development work in sinking the shaft and the keeping of the mine clear of water. Following so closely upon the suspension of operations in the Poorman mine, this announcement has had a depressing effect upon the cañyon. In all nearly 300 men are laid off by the closing of the two mines.

THE HUNTER AND MORNING MINES.—*Miner:* The Hunter mine is running along smoothly, with a force of fifty-five men. Both the mine and mill will be running on two shifts within a day or two, if they are not already. This will require about twenty additional men, making about seventy-five altogether.

Affairs at the Mourning are progressing satisfactorily. There are about thirty-six men at the mine, most of whom are doing preparatory work. There are fifteen working around the mill, flume and pipe lines.

UTAH.

A NEW INCORPORATION.—The Sunshine Gold Mining and Milling Company has incorporated. Capital stock $2,500,000; J. E. Schwartz president, F. H. Officer treasurer. The corporation is the owner of the following mining claims: Sunsbine, Sunshine No. 2, Gold Point, Lost Link, Excess, all situated in the Camp Floyd mining district. The properties are valued in the articles at $250,000. It is expected that within thirty days the new mill recently erected on the property will be in full operation, and then the Sunsbine will be running the Mercur an even race on cyanides.

NEW REDUCTION PROCESS. — Utab *Patriot:* A new process for reducing silver sulphides has been introduced into the Marsac mill this week. It is owned by the Drew-Walker Refining company, and the present is the first experiment made with it. It seems to work all right, as far as tested. It is claimed that it will reduce the fume nuisance, of which so much complaint has been made in the past, to almost nothing.

SEVIER DEAL CLOSED. — *Tribune:* Charles Lammersdorf, president of the Sevier Gold Mining and Milling Company, who has been here for the past week closing up the deal for the transfer of bis controlling interest in the company, left yesterday afternoon for Gold Mountain, where he will continue in charge of the property until the last payment is made on the property next March.

Before leaving town the last flaw in the title to the property was cleared up between Mr. Lammersdorf and George Arthur Rice, who represents the purchasing syndicate. This little affair was the only item that stood in the way of the closing of the deal on last Saturday, and as stated in the *Tribune*, it was so trivial that the payment of $40,000 was made on Saturdry by Mr. Daily and Mr. Parsons, representing the syndicate, and Mr. Rice was left to clear up the small detail.

When the option was secured on June 14th last, a payment of $15,000 was made on the spot; on Saturday $40,000 more were paid on the purchase, making a total of $55,000 already paid to Mr. Lammersdorf. There are, however, two payments to follow, one on December 14th, and one on March 14th, 1896, and in these two payments the sum of $43,250 will be equally divided, making a total of $98,250 for Mr. Lammersdorf's interest of a little more than 139,000 shares.

MONTANA.

THE U. S. SMELTER.—The United Silver smelter at Great Falls will resume October 1st. All the mines which formerly shipped to Great Falls, but, on account of the high rates made by the Great Northern, began shipping to Everett, Wash., will resume shipments to Great Falls, and a full force will be employed at the Silver smelter.

COPPER PRODUCERS.—*Inter-Mountain:* The present output of the Boston & Montana smelter is about 3,500,000 pounds of refined copper per month. The production of the Butte & Boston is a little over 2,000.000 pounds per month; that of the Heinze smelter, 1,250,000 pounds per month.

THE REGULAR STORY.—W. Hamilton Smith, said to represent an English-American syndicate backed hy the Rothschilds, is in Butte for the purpose of examining the copper properties in this district and the Anaconda mines in particular. In an interview he denied any knowledge of a deal for the purchase of the entire Anaconda properties hy the Rothschilds. The syndicate, which is alleged to have been formed for the purpose of controlling the copper output, has a capital of $30,000,000. The various companies owned hy the Anaconda have an aggregate capital of about $75,000,000. The only purchase the syndicate contemplates is the block of stock which will soon he placed on the market by the Anaconda Company.

A CONSOLIDATION.—After October 1st the Butte & Boston and Boston & Montana mining companies will he under one management, and as soon as possible the two big companies will he merged into one. C. H. Palmer has resigned as superintendent and general manager of the Butte & Boston, and Capt. Thomas Couch of the Boston & Montana will manage both companies.

SOUTH DAKOTA.

A BIG SUIT.—The United States Government has commenced suit in the United States Court to recover $700,000 damages from the Homestake Mining Company, alleging that during the past seventeen years the Homestake Company has cut 1,001,200 trees. The case is one of the most important that has ever come before a Federal tribunal in South Dakota, and over 300 witnesses for the defense are in Deadwood.

NEW MEXICO.

AROUND SILVER CITY.—*Sentinel:* The work of repairing the Silver City & Northern railroad, which suffered so severely during the late floods, is going on. The line has not been operated sine July 9th. Its rebuilding means much to the iron mines of Hanover and the

smelting men of Ivanhoe. It has been almost impossible to do any work on these valuable properties since the closing down of the road. The smelter has a great amount of matte ready for shipment as soon as the road can be put in readiness to receive and handle it. There are hundreds of tons of valuable iron ore also awaiting transportation.

The Ivanhoe smelter, which was closed down for a few days for the purpose of relining the furnace, was blown in last week. The company shipped two carloads of matte to Canon City, Colo., a few days ago and now have another carload ready. The management has completely demonstrated the practicability of the process employed at the Ivanhoe, and now that contracts have been made by which no shortage of ore may occur the smelter will in future run at full blast. They are now treating thirty tons of ore per day and employ a force of twenty-two men.

When the Cook's Peak Mining Co. closed down its extensive mining operations at Hadley, last November, it meant that the property would remain idle indefinitely, or, at least, until the price of lead would so advance as to warrant the working of the same. The Graphic is one of the richest lead mines in the country but the price of lead is so low that there is no money in working it. A watchman is kept upon the property continually but the workings are filled with water.

The Mineral Point Zinc Company at Hanover, is again working its mines. Wm. Swancoat, the superintendent, has eight men at work and a large shipment will be made to Mineral Point, Wisconsin, as soon as the Silver City & Northern railroad is opened up. These mines have been closed down for a long time.

ARIZONA.

HARQUA HALA DISTRICT.—Messrs. Kimball and Wakelin of Phœnix have bought three cars of mining machinery, including a ten-stamp mill, for the Desert mine in the Harqua Hala district.

WAGES INCREASED. — *Citizen:* The very liberal action of the Copper Queen Mining Company in voluntarily increasing the wages of its employes 50 cents a day, is the subject of much favorable remark. The Copper Queen Co. is now paying $3 and $3.50 per day wages.

ECUADOR.

Col. Gage, director of the Plata de Oro placer gold mines in Ecuador says, that within five months ten giants will be at work at the Plata de Oro, and the gold will be shipped to the United States.

Publications Received.

"The Stone Industry in 1894," by W. C. Day; an extract from the 16th annual report of the director of the U. S. Geological Survey, showing the amount and value of the various kinds of stone produced in the country in '93 and '94.

The stone industry for '94 represented an output aggregating $37,377,816 in value. In several of the States there was considerable falling off. The value of the various kinds of stone produced in this State for that year is set down as follows: granite, $307,000; sandstone, $10,087; slate, $5850; marble, $13,420; limestone, $288,900; total, $625,257. The Colorado total is $250,577; Idaho, $18,844; Arizona, $19,810; Montana, $115,270; Nevada, $1600; New Mexico, $5210; Oregon, $4993; Washington, $231,857.

The falling off mentioned above is illustrated by the decreased output for instance in this State, of granite, the value of California granite output for the year '90 being $1,329,018, and for '94 less than one-fourth that amount. The same way with marble, the '90 output in this State being valued at $87,030, and the '94 output at $13,420. In '90, the California sandstone industry yielded $175,508; in '94, $10,087. California limestone output in '90 was worth $516,780; in '94, $288,900. Either these figures are wrong and incorrect, or else they make a very poor showing for this State's branch of that part of the mineral industry. It is believed that while there is a temporary falling off in the demand, and hence in the production of stone in this State in the last two or three years, that more exact statistics would exhibit a better showing than that made by this government report, which in correct completeness does not seem to be up to the usual high standard of these productions. The difficulty of getting reliable statistics is recognized, but even that does not excuse the meagerness of the present compilation.

"The Nicaragua Canal, the Gateway between the Oceans," by W. L. Merry.

The PRESS has had considerable to say in endorsement of this great scheme, and heartily commends the spirit and purpose of this treatise, which clearly shows the business necessity and commercial importance of this proposed artificial waterway. The technical details of the project comprise the following: Total distance from ocean to ocean, 169.4 miles; canal in excavation (a remarkable fact), 26.8 miles; lengths of basins, 21.6 miles; River San Juan, 64.5 miles; Lake Nicarauga, 56.5 miles; free navigation in lake, river and basins, 142.6 miles; elevation of summit level of canal above sea level, 110 feet; length of summit level, 153.2 miles; number of locks, 6; greatest lift of lock, 45 feet; dimensions of locks, 650 feet long, 80 feet wide; depth of canal, 30 feet; least width at bottom, 100 feet; time transit from ocean to ocean, 28 hours; length of Lake Nicaragua, 110 miles; average width, 40 miles; surface area, about 2600 square miles; area of watershed of lake, 8000 square miles.

The work is handsomely issued by the Commercial Publishing Co., 34 California St., San Francisco.

Coast Industrial Notes.

—The Wave Motor Co. is going to put in a wave motor at Capitola at a cost of $9230.

—Northern Pacific earnings show an increase of $61,000 for the first week in September.

—Final surveys are being made for the electric railway between Merced and the Yosemite valley.

—California ships this year 9,000,000 gallons of wine, valued at $3,500,000, a little in excess of that of last year.

—The first carload of crude oil from Los Angeles for the Santa Rosa mine at Perris, Riverside Co., has arrived.

—The British Columbia salmon pack for the season is estimated at 500,000 cases. The total pack in '94 was 494,371 cases.

—The electric companies are going into the gas lighting business and the gas companies are about to embark in the electric lighting business.

—Last month the cargo shipments from Washington and Oregon to San Francisco were 16,030,053 feet as against 20,453,000 feet in August, 1894.

—The Merced Falls Electric Power and Manufacturing Company has incorporated in this city; capital stock $1,000,000; $60,000 actually subscribed.

—The Mechanics' Institute Fair closed its successful exhibition on the 14th inst. It is understood that the financial result is a profit of nearly $10,000.

—Nevada City will have a special election on October 28, when a proposition to bond the city for $60,000, with which to construct water works, will be voted on.

—The total cargo shipments from Tacoma for the eight months of 1895 were 54,431,405 feet. For the corresponding period in 1894 they were 30,859,146 feet.

—The report that the Southern Pacific Co. would next November discontinue one of its passenger trains between San Francisco and Ogden is officially denied.

—The Bullen Bridge Company of Portland, Or., has been awarded the contract for building a $330,000 steel bridge across the Fraser river at New Westminster, B. C.

—For the first seven months of 1895 the lumber shipments from San Francisco were 9,095,875, valued at $150,014; the same month of 1894 the shipments were 10,037,977, valued at $196,698.

—The spars from which the masts of the "Defender" and "Valkyrie" have been made were cut in Sol Simpson's logging camp at Kamilchie, Wash., and afterwards shipped from Port Blakely, Wash.

—The Seattle Drydock and Shipbuilding Company has a contract to build one of the Government's new torpedo-boats. The contract price is $160,000, and Puget Sound fir is to be used in the construction of the boat.

—The date for holding the annual convention of the National Association of Manufacturers, at Chicago, Ill., has been changed to November 19, 1895. The Manufacturers' and Producers' Association will be represented by two delegates.

—Eastern men have subscribed the money, $300,000 in cash, necessary to develop the new sulphur mines lately discovered on the west shore of the Gulf of California. It is estimated that the sulphur can be mined and put on shipboard for $1.10 per ton.

—The Western Canaigre Company of Chicago is planting 8000 acres of land to canaigre near Rialto. It will build a factory for the extraction of tannic acid from the canaigre root for shipment East, and expects to secure 500,000 tons of canaigre root the first year.

—The Fresno *Expositor* of September 12th says that Kings river is to be measured by engineers to ascertain the flow of water at this season, and also to measure the water power at different places, the idea apparently being the erection of another electric power plant.

—Exports of flour from San Francisco during the first eight months of 1895 were 588,800 bbls. as compared with 497,430 bbls. during the same time in 1894. Reducing this flour to a wheat basis gives a total exports of wheat during the eight months of 8,809,000 ctls., valued at $6,031,000 as compared with 4,978,000 ctls., valued at $4,987,000 during the same period last year.

—The Manufacturers' and Producers' Association has incorporated, and the following board of directors have been elected: O. McLaughlin, W. F. Bowers, J. P. Currier, Julian Sonntag, M. McGlynn, R. S. Moore, Louis Saroni, James Sproule, A. Sharboro, M. J. Keller and Lewis R. Mead. The capital stock of the association is $100,000, subdivided into 1000 shares at $100 a share.

—The latest and most careful estimate places the salmon pack of the Columbia river this season at 505,000 cases of 48 pounds each. To make a case of canned fish requires on an average of 70 pounds of salmon as it comes from the water. The 505,000 cases of canned fish represent 35,350,000 pounds of undressed fish, which, at 5 cents per pound, the price paid the fishermen, amounts to $1,767,500.

—J. L. Bass of Redding this week shipped 700 pounds of iron ore to the Shasta Iron Company at Oakland. This company owns a valuable iron deposit on the McCloud river near the United States fishery, and has been spending from $300 to $500 yearly for several years on the property. It is considered the best iron deposit in the county, the ore containing the highest per cent of iron.

—The Colorado Colonization Company has purchased 55,000 acres of land of R. B. Taylor, of South Riverside. The land lies in Pahrump valley, on the line of the California and Eastern railroad. A town site has been laid out and the land subdivided into 20-acre tracts. A. C. Hayes is local manager. The land company claims to be able to grow all kinds of nuts and fruits, except oranges and lemons. Machines for boring wells to a depth of 1000 feet will be put in operation.

—The Union Oil Company have an extensive oil refinery at Santa Paula, Ventura county, which they are represented as intending to remove to the vicinity of Martinez, Contra Costa Co. A tank, ninety feet in diameter by twenty-two feet in height, is being built, and furnaces constructed. The oil will be brought by sea from Ventura county, pumped into tanks and refined. It is the intention to pipe the oil to the California Powder Works and the Selby Smelting Works.

—The Pacific Mail steamer City of Rio de Janeiro sailed on the 24th for China and Japan with the largest amount of treasure which has been taken to the Orient in over two years. The total amount from the various banks and Chinese merchants netted $1,134,200, of which sum $905,400 was in Mexican dollars and $227,000 in silver bullion. This will bring the total amount of treasure exported to China and Japan this month to a figure exceeding $3,000,000. The Coptic, the last steamer to sail, carried over $1,000,000. It is more than two years since a shipment amounting to such a sum has been made.

In Answer to Questions.

The following is received:

(1) A placer claim covers the ground in and on both sides of a gulch, through which passes the only wagon road from the river to some fifty other placer and quartz mines. This road is also the U. S. mail route. Is it possible for the owners of this placer claim, when a U. S. patent is granted them for it, to close up this road and allow no travel to pass through the gulch? (2) Can they prevent any one, after the U. S. patent is granted, from laying a pipe line across their ground to placer or quartz mines above the one they own? (3) Can they close up the U. S. mail route? (4) Was any such law passed by the last California Legislature? By replying to the above you will confer a favor upon many interested miners.

It is difficult to give correct answers to general statements or questions such as the above. The details determine the status of the case, and such details are usually lacking, as in this instance. In regard to question first, if the wagon road has existed long enough to be a recognized highway it could, probably, be kept open if legal effort were so made. The U. S. mail being carried over the road cuts no figure. The contractor agrees to carry the mail from one point to another and the government only requires that he comply with its terms. It has nothing to do with what route he adopts, but assumes that in the absence of designated roads he uses ordinary established highways. Question three assumes the existence there of "a U. S. mail route." It is probable that such assumption is unwarranted. The question is answered in reply to the first question.

The second question may, in general, be answered in the affirmative. It has been decided by the Supreme Court—the date and specific case is not at present accessible—that while general State laws permit the right of way for ditches, pipe lines, etc., "for public purposes," that carrying water to a mine does not come under that head, and if it is desired to lay a pipe line across or over patented ground the right must be secured by private arrangement satisfactory to the owner of the land. Question four is a little indefinite. It would, however, be probably safe to answer it in the negative. The last Legislature did a good many foolish things, but it hardly attempted to interfere with matters under exclusive Federal control.

Our advice to the inquirer is to consult a competent lawyer, if the matter is of sufficient moment to require careful adjudication.

Personal.

A. D. GASSAWAY has been appointed superintendent of the Tip Top mine.

FRANK YEOMAN has been appointed master mechanic of the Boston & Montana mines in the Butte district.

PROF. F. S. EMMONS, of the U. S. Geological Survey, is making a report on the Boise Basin, Idaho, mining district.

W. W. ADAMS, formerly superintendent of the Hope mine, has been appointed manager of the Carson sampling works of Butte, Montana.

HENRY LORENZ, who recently sold his mine and property at Junction City to the La Grange Co. for $140,000, is in the French hospital in this city.

JAMES S. DOUGLAS is now superintendent of the Commercial Mining Company, Yavapai, Arizona. C. E. Mills has returned to Cedar Rapids, Iowa.

H. G. TAYLOR, till recently in charge of the the Anaconda properties at Camp Creek is promoted to the position of general superintendent of construction for the company.

EDWARD GOODIN, E. M., Columbia College School of Mines, '91, has been elected to the lately created chair of mining and metallurgy in the Idaho State university. He will begin work October 4th.

CHAS. STOCKS, foreman Empire mine, Grass Valley, is the 40th miner from that section who has accepted the flattering offers made by owners and superintendents of South African gold mines. The California Colony there is a strong one.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPT. 17, 1895.

546,833.—FISHING REEL — A. J. Arnold, National City, Cal.
546,567.—CUTTING DEVICE—C. A. Byrd, Drain, Or.
546,145.—CLEANING DRAIN PIPES — Cavallaro & Sturdi, San Jose, Cal.
546,586.—DREDGER—W. H. Diestelhorst, Reading, Cal.
546,588.—STAMP AFFINER—W. L. Dinsmore, Portland, Or.
546,447.—ROTARY SCREEN—H. P. Grugin, Bannack City, Mont.
546,614.—PIANO STOOL—A. Gschwend, Portland, Or.
546,450.—ORE FURNACE—H. P. Holland, S. F.
546,536.—BANJO—E. Jacoby, Los Angeles, Cal.
546,537.—LAWN SPRINKLER—R. T. Joy, Tacoma, Wash.
546,538.—BED CLOTHES HOLDER—R. T. Joy, Tacoma, Wash.
546,333.—BABY WALKER — S. Kell, Los Angeles, Cal.
546,492.—TEMPORARY BINDER—E. B. Willert, Walla Walla, Wash.
546,472.—SHADE HOLDER — O. H. Nims, Los Angeles, Cal.
546,428.—FISH SPEAR—H. F. Norton, Seattle, Wash.
546,436.—WATER BANDAGE—B. F. Springsteed, S. F.
546,479.—ADVERTISING DEVICE—C. L. Whipple, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PHOTOGRAPHIC SHUTTER.—Samuel Slayton San Francisco, Cal. No. 546,198. Dated Sept. 10, 1895. This invention relates to that class of camera shutters in which apertured leaves are caused to pass each other in such a way as to effect, during their passage, the coincidence of their apertures with the lens or diaphragm opening. The object of the invention is to provide a photographic camera shutter adapted for both time and instantaneous exposures, and of such a character that the holding and locking mechanism shall be positive, the trip mechanism delicate, and the operation comparatively noiseless and without jar. The device consists essentially of the means for operating the pivoted apertured leaves, consisting of a sliding bar connected with the shutter leaves and a pivoted lever connected with said bar and adapted by its movement to effect the sliding thereof. The lever is operated, as usual, by means of an air pump.

ADJUSTABLE ROTARY SCREEN.—H. P. Grugin, Bannock, Montana. No. 546,447. Dated September 17, 1895. The object of this invention is to provide a revolving adjustable screen which is especially adapted for washing and screening auriferous gravel, and for other similar purposes. It consists of circular heads, bars extending horizontally between the heads, with threaded ends and nuts for securing the heads together, other bars around the periphery journaled to turn loosely in the heads, having the intermediate portion of each projecting to one side of the line of the journals, so that the free edges will move about said journals, arms projecting from the journal shafts, and an annular disk having pockets on its inner face, into which said arms project, said disk being slotted at intervals to directly receive the ends of the holding bars, so that it is movable about the axis of the apparatus to open or close the screen bars with relation to each other. A beveled gear is fixed to one of the heads and an engaging pinion by which it is driven, and a sluice is placed directly beneath the cylinder. The coarse rock is dumped from the end of the screen from time to time, or discharged continuously, and the finer material passes through the screen openings into the sluice.

DREDGER.—Wm. H. Diestelhorst, Redding, Cal. No. 546,586. Dated Sept. 17, 1895. This invention is especially designed for dredging valuable auriferous and metal-bearing gravel and sands from the bottom of streams and water courses, but it is also applicable for other dredging purposes. It consists of anchored floats connected together with an open space between them, longitudinal guides or tracks extending parallel with the space, a frame or carriage movable upon said guides, means for locking it at any desired position, a bucket with means for raising, suspending and lowering it, said bucket having a handle, to the lower end of which it is swiveled, a lever extending from the truck or carriage across the open space and means for connecting the handle with the lever so that it forms a fulcrum about which the handle is movable. A chain is connected with the front of the bucket whereby it may be drawn forward about the fulcrum upon which the handle turns. An engine or source of power is mounted upon one of the floats and so connected as to drag the bucket through the gravel at the bottom, turning about the fulcrum point of its handle, and when the bucket is thus dragged, it is forced into the material, traveling in an arc of a circle so as to become loaded. The handle is then disengaged from the lever arm so that the bucket may be raised with its load, by means of a derrick and suspending chain connected with it. By means of the car or traveler, the bucket may be worked from one end to the other of the space between the floats until this space has all been dredged out, when the apparatus may be moved and anchored at some other point.

Scientific Progress.

The Maxim Gun.

Science publishes some "Notes from London," including an account of a visit of its correspondent, R. H. T. (evidently Prof. R. H. Thurston), to Maxim, the inventor. He speaks of the Maxim gun as follows: "The Maxim gun is perhaps the most extraordinary implement of war ever devised. The pressing of a hutton is all that is required of a gunner, the gun loading itself and firing automatically, at the rate of 600 to 800 shots a minute, until the finger is removed or until the ammunition is exhausted. All the needed energy in working the mechanism is supplied hy the recoil of the barrel of the gun. Hundreds of these guns have heen supplied European and Oriental nations, and they have already done much effective work. It seems hardly creditahle to the ordnance authorities of the United States that they should have permitted foreign nations to lead in utilizing so great an American invention. Mr. Maxim has not imbihed much respect for our officials, or our methods of treatment of inventors in this department of applied science, from his personal experience at home."

Some effects of the expulsion of gases from the interior of the earth were dealt with in an address hy Prof. N. S. Shaler of Harvard to the Geological Society of America at its Sgringfield meeting. Wherever gases are generated in a liquid or semi-liquid mass, the pressure is diminished over a given bubble, developing a "chimney" up which a series of bubhles may rush. There is much water in rocks and much more in soft strata. Mud lump springs along river bottoms, and particularly along the Mississippi, are impelled by the liberation of gases. Outhreaks of gases follow earthquake shocks. Hundreds of blow holes or "shock fountains" were formed along the Ashley river after the great Charleston earthquake, ten years ago, these holes being from ten inches to three feet in diameter. The liherated gas was found to have come from a stratum ahout fifty feet below the surface. Very large and strong shock fountains, 100 feet in diameter and throwing mud to a height of 200 feet, were formed along the Mississippi river during the earthquakes of 1811 and 1813. A volcanic eruption works on the same principle.

There are many reasons in favor of the supposition that Mars is more likely to have been inhabited in past ages than at the present time, in spite of its atmosphere, or water, or clouds. Mr. Proctor, for instance, has pointed out that a glohe of the size of Mars would cool rather more than two and a half times as quickly as one of the size of the earth. If the earth and Mars were in a similar condition eighteen million of years ago, Mars would have attained (according to that rate of cooling) to the earth's present condition in seven million years, *i. e.*, eleven million years ago; and the earth would now require twenty-eight million future years in which to cool as much as Mars has cooled during the last eleven million years. So far as regards that consideration, therefore, the prohability of the preseut habitability of Mars must be compared with the probability of the earth's being inhabited when twenty-eight million more years will he past and gone.

A new method of artificial respiration is described in a French journal hy Dr. Berthold Beer. The mucous membrane of the lips and of the mouth is rubbed slowly with a piece of ice, the rhythm of the motion corresponding as much as possible to that of normal respiration. In the cases ohserved hy Dr. Beer, the result was a returu of respiration very strong at first, but, with the continued application of the ice, hecoming very regular, quiet and deep. The ice, moreover, is said to have a general sedative effect, and to have been successfully employed in cerebral troubles. Two cases of asphyxia have been treated in this way hy Dr. Foges of Vienna with equal success. The method is harmless for the patient and easy for the physician, so that it may he employed for several hours at a time.

The steel ring for one of the generators of the Niagara Power Company's plant has just heen finished at the works of the Bethlehem Iron Company, and is described as the largest ring of the kind ever cast. It is 11 feet 7½ inches in diameter, ahout 5 feet high and weighs 27,000 pounds. The process of manufacture is interesting. A nickel-steel ingot 4½ feet in diameter at the bottom and 6½ feet long was cast. A hole was then hored through it lengthwise. A hlock of the proper weight was then cut from the ingot, and the cylinder thus ohtained was heated, and, under a hydraulic pressure of 14,000 tons, expanded to the present size.

About 86 per cent of the heat of sunlight passes through ordinary window glass. A German inventor claims, however, that his new glass sifts out nearly all the heat rays, but is perfectly transparent to light. A plate of the material 4x10 inches, containing 28 per cent of iron in the form of ferro-chloride, allowed only 4.06 per cent of radiant heat to pass through it, while another plate of equal thickness, having quite as much iron in the form of ferric chloride permitted 11.2 per cent to pass.

A new industry has recently heen started in Norfolk. It is a plant for the manufacture of paving hlocks out of fibers of grass growing on salt-water marshes. The grass is suhjected to a heavy pressure and large square blocks come out of the press, when three circular saws take hold of the hlock and cut it into smaller hlocks of about five and a half inches thick, provided lengthwise with long wire. These blocks are then subjected to a bath in three different kinds of oils, which make the fihre supple. The *Manufacturers' Record* is authority for the statement.

Mechanical Progress.

Compressed Air.

A test of compressed air as a motive power for rapid transit cars is being made in Baltimore for the purpose of demonstrating the efficiency and comparative cost of this means of propulsion. Two cars have heen built. Air compressors for the purpose of charging the cars are constructed.

The new cars are of ordinary size and dimensions, with the same seating capacity as those now used. The controlling device for the motorman occupies no more platform space than the ordinary brake handle. All the other mechanism is under the car floor. In process of operation the air is compressed to from 1000 to 2000 pounds per square inch and stored in the station tank. The storage capacity of the seamless steel flasks or containers in the car is considered sufficient to operate the car from twelve to fifteen miles or more, according to the pressure. After passing through a reducing valve aud being lowered to whatever is desired as a working pressure, the air is circulated through hot water and the mixture of heated air and vaporized water passes to the motors, working expansively.

The latest advance in the transmission of images by wire is the telephotograph, a new invention hased upon the remarkahle variability of the electric resistance of selenium under light of varying intensity. The transmitter is a fine selenium point, which is carried by mechanism moving it repeatedly forward and backward in a traveling spiral of very close windings. The receiver is a very susceptihle incandescent lamp arranged to move in exactly the same way as the selenium point. The despatching apparatus resemhles a photographic camera, with the lens so placed that the image to be transmitted is thrown upon the plane in which the selenium point moves. An electric current passing through the selenium point varies with the lights and shadows through which the point passes, and produces in the incandescent lamp at the other end corresponding variations, which trace out a picture identical with that at the despatching station. There are various ways—such as photography, and viewing direct through some magnifier—of making the picture visible. The speed of the selenium point is adjusted to that of the eye for receiving impressions, a continuous image of any part of the picture heing given when the point passes completely over it in ahout an eighth of a second.

A few unfortunate experiences suggest that the aspect of the entire earth might very possibly he transformed if each plant and animal species were to be placed where the conditions were most favorahle to it. The rabbit in Australia and the gypsy moth in Massachusetts have found their new homes so well adapted to them that they are even struggling with man for possession of the land. From the plant world comes the similar lesson of the water hyacinth. A few years ago a man from New Orleans saw and admired specimens of this plant in Colomhia—where it is a harmless flowering plant growing in tuhs—and took home some hulhs and grew them in tuhs in his front yard. In a couple of years the plant appeared in patches in the Bayou St. John, which connects New Orleans with Lake Ponchartrain. A year later the hayou was full of it and navigation was impeded, while it has now overrun all the canals in the vicinity, choked up the rivers, extended in great masses into the lake, traveled a hundred miles westward, and hecome a colossal and ever-increasing nuisance.

Now, when no one talks of huilding ships and railway trains of aluminum, and there are no more processes to reduce it at "two cents a pound," the manufacture is proceeding on the normal lines of evolution. The largest works producing aluminum at this time are in Switzerland, where three tons a day is prepared at an expenditure of 4000 horse power, derived from water power on the river Rhine. In this country the largest works are at Pittsburg, operated by the Hall process, producing one ton a day, hut this company has hegun at Niagara Falls, N. Y., to make two tons a day. The whole product of the world in 1894, says *Industry*. was a little more than 1000 tons, which shows just how far the metal has entered into the useful arts at its present price, which is ahout 50 cents a pound in this country and 35 cents in Europe. It is commonly claimed that aluminum cannot be used for electroplating, but Mr. Darling of Philadelphia has settled that prohlem hy electroplating 100,000 square feet of metal at the new city hall in that city.

What appears to be the most powerful explosive yet produced has heen obtained hy Prof. Victor Meyer from nitromethane hy suhstituting three atoms of the hydrogen to one of sodium. The nitromethane is diluted with sulphuric ether, and the alcoholic solution of the substance resulting from the action of sodium upon alcohol is then added. The precipitate is washed with ether and dried hy means of concentrated sulphuric acid. The explosive force of the compound is terrific, as is also that of the product when potassium is used.

A reason for doubting that oxygen is an element has been given to the London Royal Society by Mr. E. C. C. Baly. Under the silent electric discharge, the gas that goes to the cathode with long sparks is less dense than unelectrified oxygen, while in the case of short sparks it is more dense.

Electrical Progress.

Accumulator Traction.

By Maurice Barnett.

It is a matter of iuterest to railway and electrical men to know what showing hattery traction will make against its competitors, the trolley system and the underground conduit system. The underground conduit system has obtained a foothold sooner than the storage hattery system, hut it is doubtful if the former will come into general adoption. The total operating expenses of the underground system, including interest on investment, is ahout 19 cents per car mile, against 15 cents for the trolley. It is believed that when it shall have heen demonstrated that storage battery cars can compete successfully, under certain conditions, with the trolley system, underground conduit systems will play an insignificant part in the development of electric traction systems in the United States.

The douht as to the advantages possessed by a storage battery system of electric traction is largely the question of operating expenses. The great drawhack has heen the cost involved in the maintenance and handling of the cells in traction work. Iu the old-style storage hattery cars the battery was placed in the sides of the cars under the seats. The expense of inserting and removing this each trip added considerably to the operating expenses. In the new cars the battery will be placed under the car, where it can be handled easily and at ahout one-quarter the former cost of this operation.

The favorahle features of a storage battery system of traction have reference to the fact that each car is a unit by itself, independent of the powerhouse during its trips, and in no way embarrassed hy derangement in the station or overhead equipment, differing in this respect from the trolley system, where a stoppage in power or trouble in any section of the circuit may hang up all cars on the line until the trouhle is removed. Again, as the load on the eugines and dynamos in a storage battery system is constant, it follows that these need not have greater capacity than is sufficient to satisfy the average demand for power. In the trolley system the capacity of the power plant must be such as to enable it to respond to the maximum demand made upon it. As this demand is very variahle, being anywhere from 20 to 300 per cent above the average demand, it follows that the power plant for a storage hattery system will be considerably smaller than that required for the trolley system. This incidentally emphasizes the value of an auxiliary storage battery plaut for roads already equipped with the trolley system, the storage battery serving as a reservoir to store up the energy representing the difference between the average and maximum demand on a generating plant and as a regulator, enahling the engines aud dynamos to be worked at a constant load and securing them from the strains and stresses to which they would otherwise he suhject.

Sarcia estimates that, in the style of car to he used in New York, a saving of .6 cents per mile could be effected in handliug. Suhtracting this from 3¾ cents, given as a result actually obtained in practice, we have 2.7 cents as cost per car mile for maintenance and handling of battery.

Regarding the cost of power, this will depend on price of coal at powerhouse, cost of labor, oil, waste, water and other supplies, thus illustrating the difficulties encountered in making a comparative estimate of costs of power in different systems. From a paper by T. S. Badger on the cost of construction and operation of electric railways, we find that the average cost of power per car mile of twenty-two trolley roads with from 3 to 140 cars in operation, length of track 3 to 51 miles, daily mileage 80 to 150, average daily mileage 110, was 1.96 cents. Now, as in the storage battery system, engine and dynamos are run at a constant load, it is safe to assume that cost of power,

neglecting interest and depreciation, will not exceed 80 per cent of the figure given, or 1.56 cents per car mile.

Trolley construction, where iron poles are used, and where, as in cities, the feed wires must be buried, will cost about $12,000 per mile of single track. As 16 to 20 foot cars can be had fully equipped for, say, $3250 each, two cars (to the mile) will cost $6500. Making an allowance of 15-horse per car at $100 per horse power for power plant, but not including real estate or buildings, we have for the two cars $3000. Cost of road-bed will add about $7500 per mile of track. while real estate, buildings, etc., may be assumed to be $7000 per mile of track, making a total investment of $36,000 per track mile. On the basis of 56,000 car miles run per annum per mile of track length, we have, at 6 per cent per annum, an interest charge of 3.85 cents per car mile run to be added to operating expenses. For storage battery construction there is an item approximating $7600 for batteries for the two cars not found in trolley construction. On the other hand, a saving is effected of $12,000 for overhead construction, while the cost for power equipment and real estate is reduced by one-third, being $2000 for the former and $4667 for the real estate, buildings, etc. We thus have a total cost of construction of $28,267, or say $28,000, and, with the same trackage as in the case already considered, we have an interest charge per car mile of 2.99 cents.

Assuming that, in the two cases just considered, maintenance of road-bed and track, transportation and general expenses will remain the same, we can arrange in parallel the values already given. A general distribution of expenses per car mile is then as follows:

	Trolley. Cents.	Storage Battery. Cents.
Maintenance of road-bed and track	.54	.54
Maintenance of line	.18	...
Maintenance of power plant	.36	.12
Maintenance of rolling stock	1.80	.80
Maintenance and handling of batteries	....	2.70
Cost of power	1.06	1.56
Transportation expenses	4.98	4.98
General expenses	1.26	1.26
Interest on total investment	3.85	2.99
Totals	14.03	14.95

As given here, the cost of operating cars by the trolley and storage battery systems respectively on roads of fifteen miles and upwards, with twenty or more cars averaging about a hundred miles daily, with moderate grades—general conditions covering cost of fuel and supplies, wages, etc., being uniform—shows both systems to be on an equal footing.

It may be said that, even if trolley traction was more economical than storage battery traction, the system would be open to the objections that cars are dependent at all times on the power-house and have no auto-mobile character, as have battery cars; the moment the trolley leaves the line the cars are left in darkness; the high tension currents constitute a source of danger to the traveling public; the trolley line is unsightly, and overhead wires are a formidable obstruction to firemen engaged in the never-pleasant work of fighting fires. A successful storage battery system would be an ideal solution of the problem of electrical transportation.

UNIQUE propositions constantly confront our judicial tribunals. The United States court of the Nebraska district has been asked to assess damages against the electric motor lines for the depredations of vagrant electricity upon the mains of the water company in the streets of Omaha. Here are presented some novel points of law. No precedents have been set to help determine the measure of damages if any. It will remain for the water company to prove by expert testimony or otherwise to the satisfaction of the average jury that some of the electricity which charges the rails and wires of the motor line is constantly inducted to the water mains five to ten feet beneath the surface, and if this can be proved, the fact must be established that vagrant electricity accelerates decay of these pipes, and that, but for the proximity of these motor wires and rails, the mains would be in prime condition. It is an entirely new phase of jurisprudence, and the case will be watched with extraordinary interest by every franchised corporation running pipes under the street and by the electrical world at large.

Without a Trolley.

The Westinghouse Electric Company has made the first successful test of its new electric railway. The new traction system is regarded by some as considerably better than any now in use. At the works of the company in this city a piece of track has been laid on a new plan. It is called a surface railway, as the electric current is taken up directly from the surface of the road between the tracks. Square blocks of terra cotta are set in the road flush with the surface. From each of these blocks there projects slightly above the surface a circular knob of iron about four inches in diameter. These knobs are in pairs, each pair being seven feet from the next pair. The knobs on one side are all connected directly with the wire which carries the power.

As the car passes over these knobs the current is put on or off from them by a series of switches operated automatically by the car itself. By means of a long iron bar under the car, which brushes lightly over the knobs as the car passes over them, the knobs receive from a small storage battery in the car a current which instantaneously operates a switch that throws the powerful motor current into the neighboring knob. This knob is at the same instant in contact with a second long bar which transmits the 500 volt current directly into the two 50-horse power motors. When the car has passed, the switch ceases to operate and the knob is harmless.—American Manufacturer, Pittsburg.

Practical Information.

The Nearest Fixed Star.

An interesting discussion took place recently in Paris at a meeting of scientists as to the distance of the nearest fixed star. A number of astronomers had been asked to make observations of a certain star, and then to report the result of these observations to the meeting.

It was discovered that no two calculations agreed, but the astronomers departed with feelings of great satisfaction, for in no case was the difference between any two results greater than 20,000,000,000 miles.

There are eight planets moving about the sun, of which the earth is one, and astronomers have calculated, with very little chance of error, the distance of these bodies from each other and from the sun. The various results can be conveniently recorded in miles.

But when we come to the fixed stars, which are themselves suns, many of them far larger and brighter and hotter than our own sun, and around every one of which it is not improbable that a family of planets is moving, the task of computing distance is far more difficult. The abyss of space that separates us from our nearest stellar neighbor is so enormous that the human mind cannot form the slightest conception of it.

Nor is the ordinary astronomical unit, or distance of the sun from the earth, sufficiently large to be convenient in expressing the distance of the stars—that is, if we attempt to denote the distance of the nearest fixed star by stating that it is "so many times the distance of the earth from the sun," it is found that this unit is entirely too small to be used with convenience, though it measures 93,000,000 miles.

Experience has shown that it is more satisfactory to take as a unit the distance that light travels in a year, which is about 63,000 times the distance of the earth from the sun. Thus, if we say a particular star is at a distance of ten light years we mean that it is so far away that it will take ten years for its light to reach us, supposing it to have just sprung into existence.

It is curious to think that such comparatively insignificant creatures as human beings, inhabiting a fifth-rate planet, revolving around a third-rate sun, should be able to compute with any degree of accuracy the enormous distance of any one of these stars. The magnitudes are so great that the ordinary mind can comprehend them only when they are represented by some illustrative comparison. This may be done as follows:

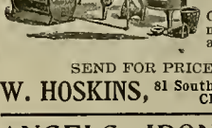
If we select any flat surface, such as a level field, and place on it a globe two feet in diameter, we may consider this the sun. Mercury, which is the nearest planet to the sun as well as the smallest of all the planets, will be represented by a grain of mustard seed at a distance of eighty-two feet. Venus will be indicated by a small pea at a distance of 142 feet from the aforesaid globe. The earth will be a slightly larger pea 215 feet from the globe. Mars will become a rather large pinhead at a distance of 327 feet from the central body. Jupiter, the largest of all the planets—in fact, larger than all the others put together—will assume the respectable dimensions of a moderate-sized orange nearly a quarter of a mile from the globe. Saturn, the beautiful ringed planet, will be represented by a small orange two-fifths of a mile from the mock sun. Uranus will be a full-sized cherry or a small plum three-fourths of a mile from the same object. Neptune, the most remote of all the planets, so far as known, will be fairly indicated by a good-sized plum at a distance of one and one-quarter miles.

If, however, we attempt on the same scale to indicate the distance of the nearest fixed star, we impose a heavy task on our power of imagination. For such a star would be represented by another globe, about two feet in diameter, at a distance of 8000 miles—in other words, at the antipodes, at the other side of the earth, on the end of a line drawn through the earth's center from the globe representing the sun.

In 1838 Bessel succeeded in demonstrating and measuring the parallax of the star known as 61 Cygni, and then, by a protracted series of calculations, in determining the distance of this star as 60,000,000,000 miles. This announcement created a great sensation in the scientific world, and the fortunate Bessel was loaded with congratulations and medals of honor. Then Struve published the results of his observations of the same star, in which he located it at not less than 40,000,000,000 miles. Curiously enough this announcement was received as a confirmation of Bessel's discovery. A matter of 20,000,000,000 miles was a trifle.

However, one star is known to be nearer than 61 Cygni. This is the star known as Alpha Centauri, which is situated in the left foot of the constellation of the Centaur in the southern heavens. It is never visible in northern latitudes, and its distance is about 35,000,000,000 miles. The distance is represented in terms of light years, as explained above, by 3.6—that is to say, if this star should suddenly spring into existence from nothingness we should know nothing about it until nearly four years had passed.

New Railroad Across Tehuantepec.



The Tehuantepec railroad, extending due north and south across the isthmus of that name which forms the narrowest part of Mexico, will be regarded as one of the world's most important lines of transportation. It was finished about a year ago, is 122 miles long, and, although its line lies along the least difficult route across the Sierra Madre mountains and from ocean to ocean between Guaymas and Panama, a distance of nearly 2000 miles, its construction was not accomplished without overcoming some very considerable difficulties in engineering. The northern, or gulf, terminus of the Tehuantepec line is Coatzacoalcos, and the southern, or Pacific, port is Salina Cruz. At the latter place there is a harbor with a hard clay bottom and no sand bars, and the Coatzacoalcos river for thirty miles above its mouth has a continuous depth of forty feet, which renders unnecessary the heavy ligtherage expenses which are such an important item at Panama.

The Tehuantepec road was projected and built by the Mexican government, which proposes to expend $15,000,000 in improving the harbors at the two terminals, and it is believed that after these harbors have been deepened and fitted with proper docks and other facilities for loading and discharging cargoes, the new interoceanic route will be sought by a large portion of the commerce between Europe and California, between Atlantic and Pacific ports of the United States, and between most Atlantic and gulf ports on the western coast of Mexico. In addition to this there is every probability that much of the commerce between Europe and the far east which now goes by way of the Suez canal will also be diverted to this route, and that practically all European trade with Chile, Peru and Ecuador will follow along the same line.

This may prove of damage to the Panama railroad, since, although the Panama railroad is less than one-fifth as long as the Tehuantepec line, the use of the latter will shorten the distance between New York and San Francisco, for instance, by about 1500 miles, and between most important European ports and China by about 700 miles. While probably it cannot be said that it will shorten the transportation to most South American ports, yet the superior depth of the harbor at the Tehuantepec terminals, enabling ships to unload directly to the railroad cars and dispensing with lighterage, as already explained, will no doubt make it a more desirable line of commerce to the south of the equator.

It cost $10,000,000 to build the Tehuantepec railroad and occupied fourteen years.

Hoskins' Patent Hydro-Carbon Blow-Pipe and Assay Furnaces.

BOYD'S
Compression Grease Cup.
The Only Cup in the Market that will give Perfect Satisfaction.
We call special attention to the Strength of the Cup, together with the High Top, which permits the use of a powerful spring that works throughout its full extension, thus ensuring the feeding of the entire contents of the Cup. Also to the Automatic Air Valve, which breaks the vacuum underneath the plunger and thus enables the Cup to be opened at any stage of the feeding without exertion or sucking back the grease or compound from the bearing. This is the only effective device for this purpose ever applied to a Cup. These cups are manufactured in several designs and sizes, suitable for various purposes. For Journals the screw top lever is ordinarily used, and can be furnished with Spring pressure or with Screw pressure without a spring; both forms, however, have the Automatic Air Valve. For loose pulleys a specially fastened hinge Cup with Automatic Air Valve is made, as shown in the cut.

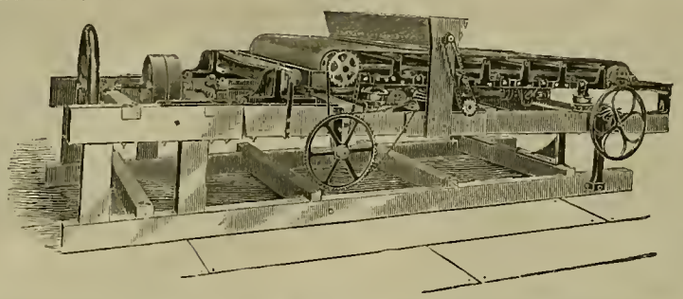
The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 13, 1892. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



NINETY-FOUR AND ONE-HALF PER CENT SAVED ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated. WHILST IN OPERATION

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 1 ft. 6 ins. wide.

FALLS MINE, Dog. SHASTA CO., CAL., May 25th, 1895.

THE McGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully
E. L. BALLOU, Propr. Ballou Reduction Works.

MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 26. 1895.

There was no change in silver during the week, the fact that it holds so steadily to the highest rate quoted for some months being of itself indicative of a steady demand.

Pig iron in all grades is advancing, and is liable to continue doing so.

The steadily declining market for years past has had a tendency to encourage the carrying of as little iron as possible in stock, and this, coupled with the recent severe business depression, has sent the buying movement down to a minimum amount, with the result that many producers went out of business entirely.

With improved conditions everywhere, and considerable of a demand, the amount of pig iron on hand has been steadily decreasing, and it is doubtful whether there is sufficient being made at this time to supply present needs. A great many furnaces and many of the largest producers have sold their entire output for the remainder of the year, and all signs point to a further advance in prices.

Mining Share Market.

SAN FRANCISCO, September 26, 1895.

The past week showed sharper manipulation than has characterized the market for several months. Naturally, the change confuses the many, although quite a number of the traders made a handsome turn both on the up and down moves. While shares in the Gold Hill mines weakened off with a break of 33⅓ per cent in Challenge, Confidence, Con. Imperial and Alpha, the other shares in that end only went off from 12½ to 15 per cent, but the latter did not move up much, consequently the weakening was less pronounced. The middle stocks did not do much either up or down, owing to the trading public having but little faith in them. Under the lead of Ophir, the north-end stocks advanced on Monday. This was due to a reported improvement in the upper workings of that mine. The advance was not fully sustained by reason of many operators inclining to realize, yet there seemed to be an undertone of strength even at the slightly lower figures. The decline in Confidence and Challenge was brought about by selling from holders who had information that in the west crosscut of the former the ore had been gone through. Evidently they forgot in their scare that the crosscut passed through over two sets of timber of ore assaying an average of over $40 a ton, mostly gold, besides of there being a strong probability of finding more ore still further west.

From an outside point of view we have every reason to believe that the public will be treated to higher figures than have been reached on the present move, particularly in the shares of the following mines: Yellow Jacket, Challenge, Confidence, Ophir, Union, Mexican and Sierra Nevada. The shares in the other mines will probably be sympathetic for the manipulation now going on points only to those in the above mines. In the Alta group very little business passed, they remaining passively inactive. The same remarks apply to shares in the mines in the Bodie district.

The news from the Comstock mines is of a continued important character, with the most active and promising work being done to the west. This has more special reference to Ophir, Mexican, Union and Sierra Nevada in the north end, and Yellow Jacket and California in the Gold Hill. The work in the two latter has considerable hearing on Challenge. The west crosscut in California passed through the ore found on the drift run from the top of upraise made above the surface tunnel level. There are well informed miners who think they are liable to strike another vein as they work west. Be this as it may there can be no doubt that the ore runs down, and before two weeks it will be struck by the west drift that is being run from the surface tunnel by Confidence. In Yellow Jacket important work is being done, but reliable particulars are hard to get. In Crown Point, Belcher and Kentuck the work points to more time as yet, as does that in Con. Imperial and Alpha, the middle mines, and also Best and Belcher and Gould & Curry. In Ophir, and also in Sierra Nevada, they have a large block of ground blocked out to the west for exploiting, while the work going on in the lower levels of both Ophir and Mexican bears close watching. In Con. Virginia they will soon be ready to drift for the upward continuation of the ore found on the 1100 foot level. In Andes prospecting work has been resumed. Mr. Tangerman, superintendent of the West Con. Virginia, is expected to leave for Virginia City on next Saturday to start a diamond drill to run west from the end of their long west drift. This is to be done for the purpose of draining the water further west, and also to find the distance that the west drift has to be run before striking the west lode. Mr. Tangerman and others that have examined the mine are firmly convinced that the west lode will be found to extend downwards, and that it will be struck by the drill at a depth of over 1600 feet from the surface. If this expectation is realized it will have a direct beneficial bearing on both Ophir and Mexican. The mill has resumed crushing Crown Point and Hale & Norcross ore, about 220 tons will be reduced the forepart of next month.

Work by the different mines owning ground on the Brunswick lode is being pushed as fast as possible. It is thought they will be in a position for exploiting by mining drifts some time in October. In Occidental the work continues somewhat of a dead character, which will be followed before long by more active exploiting. From the Bodie mines there is nothing new or interesting reported either officially or by private correspondence.

The lowest and highest prices paid on regular call from Sept. 20 to Sept. 25, inclusive, were as follows:

	Lowest.	Highest.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from E. C. Hard, in the Terry Hill Mine, near Spanish Ranch, Plumas Co., to impound tailings in an old pit; from Will De Vinny, in the Lone Star Placer Mine, Cromberg, Plumas Co., to impound tailings in Jackson Creek; from Charles Jordan, in the Poor Man's Hydraulic Mine, near Placerville, El Dorado Co., to impound tailings in Taylor's Ravine; and from L. Canato and G. Oueto, in the Eagle Mining Claim, on Dry Creek, Amador Co., to impound tailings below the mine, gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Oct. 14, 1895, at 1:30 P. M.

1000 FEET FOR $1000.

This can be done with the

CHAMPION DIAMOND CORE DRILL

That we own and desire to sell, having completed prospecting our mine. The plant is complete in every detail, including every tool and diamonds, and is practically new. The 1¼-inch core can be taken out 1000 feet in depth at any angle at the rate of 20 to 50 feet a day. Why sink shafts, drive drifts and fight water to know your mine?

S. V. RYLAND,
Gold Hill Mine ..... Angeles Camp, Cal.

ANCHOR COAL AND DEVELOPMENT COMPANY.

NOTICE OF ANNUAL MEETING.

The annual meeting of the shareholders of the Anchor Coal and Development Company will be held at the office of the Company, No. 632 Market Street, Room 5, San Francisco, California, on MONDAY, the 21st day of October, 1895, at 11 o'clock A. M., for the purpose of electing a Board of Directors for the ensuing year and the transaction of such other business as may come before the meeting. E. D. FARISH, Secretary.

OFFICE.

The shareholders of the Anchor Coal and Development Company will please take notice that the office of the said Company has been removed from 19 Montgomery Street to 632 Market Street, Room 5, as per resolution of the Board of Directors.

Assessment Notices.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Fairfax, Marin County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 23rd day of August, 1895, an assessment, No. 4, of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 21st day of October, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room No. 56, No. 309 Montgomery street, San Francisco, California.

SONORA EXTENDED MINING CORPORATION.—Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of August, 1895, an assessment, No. 3, of 2½ cents per share was levied upon the whole of the capital stock of the corporation, both paid and unpaid, payable immediately in United States gold coin to the Secretary, at the office of the company, 213 Jackson Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1895, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 28th day of October, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. A. STRATTON, Secretary.

Office, 213 Jackson Street, San Francisco, California.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 27) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Name.	No. Cert.	No. Shares.	Amt.
M. J. McDonald, Trustee	294	5,000	$500 00

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

VOLUME LXXI. Number 14. SAN FRANCISCO, SATURDAY, OCTOBER 5, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Schilling Gas Engine and Pump.

The upper illustration is of the Golden Gate Gas Engine and Schilling pattern double cylinder, outside packed plunger pump, represented by the makers, Adam Schilling & Sons, 211 and 213 Main street, San Francisco. as sure, economical and satisfactory. The cut is of a 12 H. P. just put in for Mysell & Rollins, with a pump raising fifty gallons per minute against 110 pounds pressure. Special merit is claimed for the Golden Gate Gas Engine in works requiring variable power. A complete regulator is attached to the inlet valves, that opens or shuts them as required to maintain a steady speed and power.

The Golden Gate Engine can use natural gas, water gas, coal gas or gasoline, and can be used where any rotary power is needed.

SCHILLING GAS ENGINE AND PUMP.

CONSIDERABLE prospecting for petroleum is now being done all over the State. Under the mining law, petroleum is classed with placer mines, being subject to the same conditions as to taking up and annual assessment work, the fact that petroleum is producable in paying quantity being a requisite for procurement of a patent.

Oakland Water Co.'s Pipe Line.

The two accompanying engravings are from photographs of an euterprise recently brought to a successful termination by a San Francisco firm—the Oakland Water Co.'s pipe line from Alvarado to Oakland by way of San Leandro. The length of the pipe is about 22 miles, consisting of 30 in. in diameter from the pumping station at Alvarado to 22nd avenue in East Oakland, where two branch lines of 20 in. each run to Oak street, Oakland. The pipe is made of the best American iron, and rivets and everything about it is of American manufacture. In order to facilitate the work a plant was erected by the manufacturers of the pipe, Francis Smith & Co., at San Leandro, complete and well arranged, and from this as a base the line was run both ways. About seven months were occupied in the manufacture and laying of the pipe, and, as an evidence of the class of work done, not a seam or rivet leaked from one end to the other. The pipe is double riveted, chipped and caulked, coated inside and out with asphaltum, and has been subjected to 150 pounds pressure. The firm, whose San Francisco office is 150 Beale street, makes a specialty of this class of work.

READY FOR SHIPMENT.

A PORTION OF THE LINE.

THAT portion of the press of Washington and Montana not controlled by the Northern Pacific Railroad Co. is directing attention to the efforts of the corporation to have confirmed the mineral lands contained in the government grant. The fact that mineral lands are directly and explicitly exempted in the act conveying the lands, and the further fact that the Supreme Court of the United States has overruled the railway company's claim, is not taken into account. The Northwestern Miners' Association, which organizes at Spokane this week, should see to it that the plans of the two adroit lobbyists already at Washington are thoroughly exposed, and that the mineral areas of the Northwest be kept for the people to which they belong.

THE mining interests of Utah are great and growing. The new State will shortly be represented on the American flag by the 45th star. It should be represented in the U. S. Senate by men worthy in every way of the honor. Judge Goodwin of Salt Lake is such a man, and the Utah miners should see to it that he is put in a position to aid them and all other interests of the new commonwealth.

ABSURD statements appear regarding the "prevalence of cholera" in this city. There is no cholera in this city, has not been, and there is not the slightest probability that there will be.

IN addition to the regular edition, 5000 extra copies of the issue of this paper of the 12th inst., and a similar number of the issue of the 19th inst., will be published.

THE property of the Merced Gold Mining Co., in Mariposa Co., this State, consists of forty-three claims. The capital stock of the company is 100,000 shares, quoted in Bostou at present at $43 per share.

ELSEWHERE is published a complete compendium of the gold output of the Witwatersrand, South Africa, district from its inception. The aggregate is 9,367,961 ounces, worth $188,000,000, the amount produced by that portion of the earth's auriferous regions to date. To date California has produced gold to the value of $1,350,000,000.

IT is seriously proposed in British Columbia to levy an export duty on ores. The mining industry of that province is enjoying considerable present activity. Such action would check that prosperity, and, while of immediate benefit to the Canadian Pacific Railway and the enterprises controlled therehy, would be of permanent injury to the province. It would straugle competition, give the miner no choice and destroy the value of many of the mines. The proposition is a short-sighted one and deserves defeat.

AFTER over forty-three years of continuous and successful work, Col. Geo. H. Mendell, the local head of the U. S. army engineering corps, will next Saturday he retired, that being his 64th hirthday. His record is a splendid one for the corps and a most honorable one for himself. To write of his services would constitute a history of the work of the corps on this coast. So far, no intimation has been received as to who will he his successor. Whoever he may he, he will also assume Col. Mendell's present position in the U. S. Dehris Commission. As at present constituted, that Commission is composed of Col. Mendell, Lieut.-Col. Benyaurd, Major Heuer and Lieut. Gillette. Lieut.-Col. Benyaurd is next in command, and has acted as head of the entire department whenever Col. Mendell was absent.

ELABORATE STATEMENTS are received from the East showing that the profit on the recent hond syndicate deal "protecting the U. S. treasury" was only $174,338. Till that disgraceful deal is either forgotten or explained the perpetrators and accomplices can hest avoid disagreeahle reminiscences by remaining silent. Mendacity is evidently only a venial offense in the sight of the self-constituted "protectors" of our national credit. As a plain, hald fact, it is of record that the bonds were issued to the syndicate by the government at $1.04½ and sold at from $1.12½ to $1.17, and the profit made by trading on the credit of the United States was over $9,000,000. Doubtless all concerned are ashamed of it, hut that doesn't justify them in lying about it now. The record is so clear and so recent that the falsehood is evident. The gentlemen who are sending their little pamphlets, "Sound Currency," to this office are wasting some of their profits.

The Proposed Compromise.

On the 1st inst. Mr. W. H. Mills, representing the Land Department of the Central Pacific and California and Oregon Railroad Companies, sent a suhstitute proposition to the Committee on Protection to Mineral Lands, accompanied by a communication in which he expressed a desire for immediate mutual agreement in the matter, named C. E. Uren of Grass Valley as the company's commissioner in case his proposition was accepted, and asked, in the event of affirmative action on the part of the committee, that the commissioner representing the Miners' Association be named at once.

The railroad proposition is drafted as follows:

The Central Pacific Company, hy William H. Mills, its land agent, the first party, and the California Miners' Association, hy the undersigned, its committee for the protection of mineral lands, the second party, have agreed as follows: First—That each party will, within ten days from the date hereof, appoint a reputable and competent person whose duty it shall he to inspect such unpatented lands claimed hy the first party in California as the parties hereto may suhmit to them; and to testify as witnesses in the proper land office of the United States as to the character, for valuable minerals contained, of all the lands inspected hy them; such testimony to he given at hearings ordered, or to be ordered, by the general land officers of the United States, for the ascertainment and determination of the character of said lands.

And herein it is agreed that the persons so to he appointed may, when they concur in so doing, present protests to the General Land Office against the issue of patents to the first party, couveying any lands which have been submitted to, inspected and ascertained hy them to he mineral in character, and the first party hereby consents that hearings may be ordered by the general land officers, in pursuance of such protests.

And herein it is further agreed that the character, for minerals, of all lands suhmitted to and inspected hy them shall he determined hy the testimony of such persons alone, notwithstanding third persons may testify at the same hearing.

Second—That in all cases where the two persons to he appointed, aforesaid, disagree as to the character, for minerals, of any tract or tracts suhmitted to them, they shall appoint a third reputahle and competent person, who shall have the same qualification and duties as the said first named persons; and in all such cases no testimony shall he given, nor action be taken, except hy the two of such persons who have served, and then only in so far as they are agreed.

Third—The first party agrees that it will, at the request of the said persons to he appointed, apply to select any lands suhmitted to them, which are not listed, in order that hearings as to the character thereof may he properly and promply ordered hy the general land officers; and that it will not seek to procure the issue of patent to it for any of the lands submitted to the said persons until after inspection and action hy them, as herein provided. And the second party agrees that it will facilitate in all ways within the powers, influence and persuasion, and will not hy action or countenance obstruct the speedy issuance of patent to the first party for all lands not found by the said persons, or hy the General Land Office decisions rendered in pursuance of their testimony, to he essentially mineral in character.

Fourth—The party of the first part will furnish free railroad transportation for the use of each of the said persons when traveling in the performance of their duties herein provided. Such party is to pay for the services, and all other expenses of the persons which it may appoint in pursuance hereof; and the pay for services and expenses of the said third person to he appointed shall he furnished hy the parties hereto in equal shares.

Fifth—The territory comprising such of the lands within the Central Pacific and California and Oregon land grants of the first party, as shall he submitted to the said persons, may be divided into several divisions, and all the provisions hereof are alike applicable to each subdivision.

It is desired hy the railroad companies that, if the proposition is agreed to, it shall he definitely understood that, in all cases where the commissioners agree, such agreement shall he suhmitted for judicial decision to the registrars and receivers of the districts in which the land in controversy is located, such decision to he final and accepted hy hoth sides, thus making the Government a party to the issue. It is to he noted that in any event the Government would have the last say and the sole right to legally decide the matter.

The Mineral Land Committee met on the afternoon of the 3d, and after very little argument or discussion decided to reject the proposition as offered. The following resolution was adopted hy the committee:

Resolved, That the form of agreement suhmitted to this committee hy William H. Mills of the Central Pacific, etc., he rejected, and that Mr. Mills be informed hy the chairman of this committee that this committee stands upon its proposition suhmitted under date of September 17th, the same to he subject to such minor modifications as shall in no manner interfere with any essential particular.

Ou the 4th a letter was sent to Mr. Mills hy the committee officially acquainting him with its helief that the proposition as received from him was too ambiguous and indefinite for acceptance. It was a concession from the first pronunciamiento, but too one-sided to justify the committee's approval.

California Iron Ores.

An article in last week's issue on "Iron Ores in California" may be supplemented by reference to further analyses of the San Bernardino magnetic and hematite ores hy Henry Wulf, chemist of the Union Iron Works, showing the constituents to be as follows:

MAGNETIC IRON ORE.

Sesquioxide of iron	66.000
Protoxide	25.000
Alumina	2.842
Oxide of manganese	.520
Lime	.720
Magnesia	3.830
Phosphoric anhydride	.006
Sulphuric anhydride	.013
Silica	.840

HEMATITE IRON ORE.

Sesquioxide of iron	81.840
Protoxide	8.250
Alumina	3.200
Oxide of manganese	.750
Lime	.430
Magnesia	3.180
Phosphoric anhydride	.002
Sulphuric anhydride	.117
Silica	1.071

In an article in the Los Angeles *Manufacturer*, St. John Day says these ores can be laid down there for $3 per ton. Ordinarily the price of iron and steel on this coast has been fixed by the Eastern prices with freight added, which ranges from $5 to $10 per ton, depending on the manner of shipment. Tbe irou ore is here, as has been shown, in unlimited quantity and of excellent quality, and the only difficulty in the way of economical smelting it has been the absence of requisite fuel. The employment of mineral oil for the reduction of iron ores is being given present practical test in the reverberatory heating furnaces at the works of the Los Angeles Iron and Steel Company, though the heating or reheating of masses of wrought iron, such as is practiced at these local works, is a totally different operation in respect of the character of the flame to be used as compared with what would be necessary in the application of mineral oils to the smelting or reduction of iron ores in reverberatory furnaces. Mr. Day feels safe in giving the assurance that while a neutral flame *is* necessary for the heating or reheating of scrap, puddle, muck-bar or other masses of rolled or forged iron for the production of plates, bars or forgings, which experience at the local works of the Los Angeles Iron and Steel Company proves to he a matter of every-day practical success, yet it is equally certain that a carbonizing or deoxidizing flame may with equal ease he produced from these oils so as to hurn out or reduce the oxygen from the raw ores placed in similar reverberatory furnaces, thereby at once smelting or reducing them, if so desired, to the metallic condition necessary for being either at once rolled into merchant iron, or which hy the addition of carbonaceous matter in the form of spiegeleisen or ferro-manganese, may be run in the condition of crude cast iron into pig-beds so as to produce at once pig iron from such reverberatory furnaces, or with a lesser quantity of the carbonizing elemeuts and mangauese, cast iuto steel ingots.

THE value of some of our California gold mines received apt illustration this week. Ordinarily, it is a matter that, not concerning the general public, is not given out any more than any other private business, as the producing gold mines of this State are not listed and not subjects of stock jobbing speculation. Last Monday, however, C. D. Lane, of Angels, Calaveras Co., had occasion to qualify as a surety on an appeal bond in a mining suit, and was required to show that he was worth $1,000,000. He produced a deed showing his ownership of a one-third interest in the Utica and Stickles mine and also a statement of the receipts and expenditures of the mine for every month from January, 1893, to September, 1895. The gross receipts were $4,154,026.52 and the expenses $1,683,414.24, leaving a net income of $2,470,612.28 for that period.

NEW PROCESSES are as frequent in announcement as the formation of new mining companies, and often as ephemeral in their duration. French mineralogists, with headquarters in Denver, claim to have succeded in "combiuing cyanide and electricity," and for some months have heen experimenting with that potent compound in laboratory work on the Pelatan - Clerici process. The ore having been ground to an almost impalpable powder is placed in a leaching vat, the bottom of which is a copper plate covered with mercury and connected with a

dynamo, a cyanide solution added, and a central shaft kept revolving for eight or ten hours, when, it is claimed, the freed gold is deposited to the amount of 80 per cent in the case of sulphides. It is now announced that a plant capable of handling fifty tons per day is to be erected at De Lamar, Idaho. The process was patented in this country last October. So far the alleged results have been obtained solely in the laboratory.

A CALIFORNIA MINER who recently returned from South America told the editor of this paper last week that gold claims in some parts of that country, of which much was said regarding their size and richness, would not be looked at by a Chinaman in California. The remark, besides illustrating the richness of California gold mines, calls to mind the fact that Chinese in this State, with their rat-like thrift, extract a great deal of gold. The aggregate amount of the product of Chinese-operated mines runs into the millions. Of course, they never reply to any request for information; but estimates from storekeepers, gold-dust buyers, express agents and bankers indicate that for the twelve months ending December 31, 1894, there was over $1,500,000 produced by Chinese miners in this State. In the one county of Siskiyou alone $325,000 was thus produced; in Trinity, nearly $250,000; and in Placer, $175,000. This applies solely to small claims owned and operated exclusively by Chinese.

Concentrates.

WORK has been resumed at the Inyo Marble Works near Keeler.

THE smelter at Pilot Bay, B. C., closed down temporarily last Tuesday.

WORK to the amount of $100 done in one place will hold a 160-acre placer claim.

THE *Miner* claims that Rossland, B. C., is the most orderly mining town in America.

THE Morning Star Gravel mine, Placer county, has declared dividend No. 58, of $3 per share.

THE Gopher Boulder Company, El Dorado county, have started up their new electric plant.

IN the current number of the Cripple Creek, Col., *Mail* appear forty-one applications for patent.

A FIFTY-CENT ASSESSMENT has been levied upon its members by the Siskiyou Co. Miners' Association.

LINCOLN county is now producing more gold than any other county in Nevada. Esmeralda is second.

DURING the week ending Sept. 29 the deposits of gold at the Denver U. S. assay office aggregated $87,589.57.

S. F. MOUNT, of the Ibex mine, Richfield, Utah, proposes to build a mill, instead of shipping the ore 155 miles.

THE several county miners' associations have nearly all elected delegates to the convention of the 14th inst.

THE pay-roll of the Bunker Hill mine at Wardner, Idaho, for July was $19,000; August, $28,000; September, $38,000.

AT present there are 150 shipping mines at Cripple Creek, Col.; the number of men employed in these properties is 2600.

THE South Eureka Mining Company of Amador county has levied an assessment of 2 cents per share, delinquent November 4th.

THE Hesperides Mining Company has incorporated in this city; capital stock $150,000; of which all but $149,950 has been subscribed.

THE old Cosumnes copper mine, three miles from Henry's, El Dorado Co., is to be reopened and worked. John Theisen has a patent for it.

TO DATE the U. S. Debris Commission has received 155 applications for permits to resume hydraulic mining. Of these, 106 have been granted.

THERE is no United States mining law requiring the recording of notices that assessment work has been done with the Recorder of the district.

THE Marguerite Mining Company has bought the Salsig quartz claim of twenty acres adjoining the Marguerite claim, near Auburn, Placer county.

THE Emma mine, Utah, has been disposed of by its long-time London owners, who are going to buy a gold property in New South Wales for $130,000.

ON the 1st inst. the Napa Consolidated Quicksilver Mining Company paid a quarterly dividend of 10 cents and an extra dividend of 10 cents per share.

STATE ATTORNEY GEN'L HART has decided that the State Debris Commissioners' office was legally created and the incumbent entitled to the salary.

THE Oregon & California Gold Mining Company has incorporated in Portland, Or.; capital, $250,000; incorporators, J. S. Gill, G. H. Dammeier and M. O'Neil.

AT Mullan, Idaho, the Hunter mill and mine is now running two shifts, employing seventy-five men. M. Curran is superintendent, and J. T. Walker foreman.

THE *Messenger* says that the Sierra Co. delegation will attend the coming convention untrammeled and free in every respect, which is probably the case in general.

LAST Monday the Debris Commissioners granted permission to mine by the hydraulic process to John Pasco of the Eureka mine, near Placerville, and to John F. Coe of the Railroad placer mine, near Spanish Flat. Charles Jordan of the Poorman's mine, near Placerville, was given permission to construct dams.

GEO. A. WILLIAMS, superintendent of the Atlanta G. and S. Co. mines, Glen Davies, Idaho, is going to add 10 stamps to the 20-stamp mill there, under instructions from his London principals.

THERE is still talk of compromise of the Hale & Norcross case. Various bases of settlement are announced, but it is probable nothing but cash would be acceptable to the successful contestants.

THE extraordinary demand for copper in the electrical world directs attention to the fact that nearly every mountain county in California has copper ore that at present prices will pay to mine and export.

ACCORDING to the *Mining Industry and Review* there are a host of process mills in Colorado which were conceived in sin and born in iniquity. A lot more were conceived in ignorance and born in incompetency.

IN southeastern Arizona the Copper Queen, at Bisbee, employs 850 men in the mine and smelters. At Clifton and Morenci, the Arizona Copper Company and the Detroit Company together employ nearly 1000 men.

MESSRS. LAKIN, BOTHWELL AND MCCONAUGHY, owning the Lakiu group of mines, Camp Floyd district, Utah, propose to put in a mill and power plant with a capacity of 100 tons per day and leaching tanks with a capacity of sixty tons.

THE Lillooet, Fraser River & Cariboo Gold Fields, Ltd., has organized in London with a subscribed capital of £282,000, of which £175,000 is available for investment in British Columbia mines. F. S. Barnard of Vancouver, B. C., is manager.

THE lead and zinc miners of Iowa, Wiscousin and Missouri, who have for years been at the mercy of the smelters, have organized an association, with headquarters at Joplin, Mo., and will build smelters which they propose to run on the co-operative plan.

THE old employes of the Spotted Horse mine at Maiden, Mont., have foreclosed their liens, and their claims have been taken up by the Bank of Fergus County, which has now obtained possession of that celebrated gold property. The mine has produced millions.

THE Alaska Willougby Gold Mining Company has incorporated here this week; capital $100,000; directors, Stewart and Miller of Fort Bragg, J. Hunter of Vallejo, W. H. Payson of Berkeley and C. L. Tilden of Alameda. So far $99,930 remains to be subscribed.

JAMES GLASS, general manager of the Basin and Bay State Mining Company, has received $100,000 from the Eastern stockholders to rebuild the recently burned works of the Katie mine. The original plant was for 150 tons; the new one will have a 500-ton capacity.

MARMION & PICKETT of Indianapolis, Ind., have bought 735 acres on the middle fork of the American river, east of Georgetown, El Dorado county, and will build a 20-stamp mill on the upper part and hydraulic the lower end. W. C. Green will be their general manager.

THE Elmer Brown Copper Mining and Smelting Co. has incorporated at Grant's Pass, Oregon; capital stock, $900,000; incorporators, W. S. Elmer, Baltimore, Md., Messrs. Wheeler, Brown & Wade, Grant's Pass. The company has recently begun to work a copper producing property in the neighborhood.

THE Butte *Miner* asserts positively that a quarter interest in the Anaconda mine has been sold to the Rothschilds syndicate, the stock has already been placed on the London market by the syndicate, and that the Rothschilds have an option on the remaining three-quarters of the stock and in all probability will purchase it unless the report made by Hamilton Smith be unfavorable.

THE Mountain Mining Company, operating in Shasta county, is expending over half a million dollars, in addition to the $300,000 paid for the property. The new smelters are building at Keswick, five miles from Redding, from which point a narrow-gauge railroad is being built to Iron Mountain, eleven miles. Some of the Iron Mountain ore assays 28 per cent copper. J. A. Hill is the manager for the company.

SPOKANE, Wash., is feeling the good effects of the revival of mining in the Trail creek and other districts. During the past year over $250,000 has been paid out in Spokane in dividends; one mine, the War Eagle, alone paying $132,000. The Le Roi has paid $25,000, the Slocan Star $50,000 and the Cariboo claims large amounts. In addition to these dividends, many claims have been developed out of the proceeds of the mines.

THE Supreme Court of Utah has decided that "work done outside of a mining claim, if done for the purpose and as a means of developing the same, is as available for holding the claim as if done within the boundaries of the claim itself. One general system of work may be devised, well adapted and intended to develop several contiguous claims, and when such is the case, work in furtherance of the system is work on the claims intended to be developed by it."

THE annual convention of the Cal. State Miners' Association will be held at Pioneer Hall, Fourth street, near Market, this city, Monday, October 14th, and will be called to order by President Neff at 10 A. M. Each county organization is entitled to one delegate for each ten members, but the committee on credentials will probably not be arbitrary, and any bona fide representative of mining interests will find no difficulty in securing a seat.

THE work of establishing sign boards on the San Bernardino desert, to indicate the different trails and places where water can be obtained, is to be done. About 100 boards will be needed to mark the various localities and sufficient space will be had thereon to give the needful directions, distances, etc., to enable the traveler on that vast expanse of territory to get from place to place with the least danger of losing his way, and wandering too far from a water supply. These signs will be entirely of metal, of sufficient strength to withstand the fierce prevailing winds, and painted in such colors as will be observable the longest distance.

SUBSTANTIAL profits are enjoyed by many California gold mine owners. In the course of some inquiry regarding his qualifications as a bondsman last week, Mr. Lane, owner of one-third of the Utica mine in Calaveras county, testified that his income from that one source for some time was, monthly, $40,000; Mr. Nevills of the Rawhide mine says the net yield of that property is over $80,000 a month; Major McLaughlin of Butte is credited with securing a monthly yield of $20,000 from the Banner mine.

SILVER, which was as low as 59 a few months ago, is now steady at 67. Notwithstanding its low price, improved methods of treating ore, cheap smelting charges, low freight rates and lower expense on account of wages and supplies, make it practicable in Colorado and elsewhere to work some silver mines at a small profit. Gold monometallism, while lowering the price of silver, has lowered also the price of articles used in silver mining, and thus has slightly neutralized the evil effects of the decline in silver's market value.

TALKING about assessment work at Sheridan, Mont., according to the *Inter-Mountain* one man said he had known claims around there that had been held for 20 years and there was not a hole on them big enough for a man to hide in. "I know of a case," said another, "where there is a claim, on one end of which the graveyard for the town is situated. That man has held that claim for 25 years on nothing but funerals. Every time somebody got buried he would file his statement and claim that the assessment work for that year was done."

A BIG sheet of lead ore was recently discovered at Dubuque, Iowa. The crevice is from three to twenty feet wide and the ore has been cut down to the depth of twenty-five feet and is still going down. This mine has produced 60,000 pounds in eight hours. It gives employment to fifty-five men. The ore at the top of the opening is mixed with rock nine feet high and four feet wide. The solid block mineral makes under this and is from twelve to twenty wide. One block of this ore was broken up in this mine and produced three carloads of pure lead ore, or 120,000 pounds.

THE Commissioner of the general land office has instructed the general land Commissioners in Idaho and Montana to continue their work of classifying mineral lands in that section. The appropriation made for the work has run out, and the Commissioners have asked whether they should continue the work. Commissioner Lamoreaux has studied the wording of the act creating the commission, and believes that the appropriation made was intended to be a salary, and not a stipulated sum for the carrying out of the work. He believes that Congress will make the necessary appropriation in the next deficiency bill to pay the Commissioners the balance due them.

THE Goldbug Placer Mining Company has incorporated at Salt Lake, Utah; capital $500,000, divided into $1 shares. Of the incorporators J. A. Brown of Charlton, Ia., J. C. E. King, P. E. Jones and L. B. Smith of Salt Lake each take 60,000 shares; J. W. Carter and H. V. Carter of Callaban's, Cal., each 30,000 and P. E. Jones, trustee, 200,000 shares. P. E. Jones is president of the company, J. A. Brown vice-president, J. C. E. King treasurer, and La Verne B. Smith secretary. The Blue Gravel, Montezuma, North Star, Green Mountain, Tangle Blue and Rattlesnake placer claims, containing in all 120 acres, on the north fork of Coffee creek, Trinity county this state, are turned into the company at a valuation of $300,000.

IN its mine notices the South African *Financial Record* of August 24th, published at Johannesburg, says, speaking of the Wemmer: "The profit for July has reached the record figure of £13,990, and in well informed quarters it is anticipated that even this will be considerably exceeded in August. The Wemmer shareholders have good cause to feel grateful to the retiring manager, Mr. Emilie Abadie, for the masterly and economical way in which the mine has been handled during the present year, offering, as it does, so remarkable a contrast to the extravagant management of other rich mines in the neighborhood, and to the previous history of the Wemmer itself. It is to be hoped that the shareholders will see fit to make some practical recognition of their obligations to Mr. Abadie, who shortly leaves to take charge of the Buffelsdoorn mine."

GEO. W. GRAYSON, of this city, has brought suit in the U. S. Nevada District Court for the use of that part of the water of the Humboldt river traversing the northern portion of Eureka Co. Some years ago he secured a 10,000-acre tract in that vicinity, and built a dam across the Humboldt to divert the water not already taken up. Subsequently the defendants in this suit bought 100,000 acres below his 10,000, and built a dam above the one he had constructed, and also a six-mile ditch, diverting all the water to their property and leaving the Grayson tract dry. In Nevada the law is that the first settler can divert to his own use as much water from any stream as he can use, conditional on his naming how much he can and will annually consume, a figure that cannot be subsequently changed. Subsequent settlers can use as much of the residue as they please, provided there is no encroachment on the rights of the first settler.

IN the London *Mining World* of the 14th ult. are several full-page prospectuses which illustrate the present mining-share activity in the world's financial metropolis. "The Central Woalth of Nations, L't'd.," in Coolgardie, West Australia, capital £160,000, is offered at the par value of £1 per share, to the amount of 100,000 shares. "The Great Talunga Gold Mine, L't'd.," capital £120,000, has another page; "The Miner's Dream Gold Mines, L't'd.," capital £125,000, has another page. So also with "The Menzies Golden Age Mine, L't'd.," capital £100,000; "The Menzies Pioneers, L't'd.," capital £120,000; "Rand Consols, L't'd.," capital £150,000; "Christmas Reef, Rhodesia, Development Company, L't'd.," capital £100,000, and numerous others. The London *Financial Times* also contains full-page advertisements of company after company now being floated with more or less nebulous plans of engaging in business in the South African mines. The issue of that paper for September 6th has full-page prospectuses of Selukwe-Consolidated, L't'd., capital £170,000; the North White Feather Consolidated Gold Mines, L't'd., capital £225,000; the White Feather Renown Gold Mining Company, L't'd., capital £75,000, in shares of 4s. each; the Bamboo Creek Gold Mining Company, capital £100,000; the Champion Reef Gold Mining Company, capital £150,000; the Lombardy gold mine, capital £64,000; the Dixie Gold Mining Company, capital $85,000. That is certainly a good list of new gold-mining ventures to be advertised in a wholesale fashion in a single issue of a financial paper. The issue of the same paper for the following day contains nearly as many more, and quite different ones. New mining securities are being ground out at the rate of millions of dollars a day. The public is subscribing for them eagerly, and quotations in the market after trading commences go up and up.

The Gold-Silver Veins of Ophir.

In the fourteenth annual report of the U. S. Geological Survey is an illustrated monograph on the Gold-Silver Veins of Ophir, Cal., by Waldemar Lindgren, which gives in considerable detail a history of the district, its yield, its topography, geology, the vein systems, mineralogy, and other interesting data. In that portion of the article relative to the gangue, Mr. Lindgren writes:

The quartz forms practically the only gangue material. When in normal, fresh condition, and not having suffered any changes from chemical or dynamical forces, it is milky white or transparent when occurring in small crystals. It has a glassy, often somewhat greasy, luster, and is composed of relatively large individuals, not intergrown to any extent, but forming a coarse mosaic. Some grains show crystallographic outlines. Gas and fluid inclusions of most irregular outlines fill the grains, and, while sometimes wholly irregularly arranged, usually show a banded or parallel appearance, the bands often continuing across different grains. Calcite sometimes occurs in smaller grains, but is entirely accessory in character. On the Conrad vein and a few others it appears in larger quantities, though still very subordinate to the main quartzose gangue. On the surface, of course, the quartz is often reddish or brownish from decomposed pyrites. The structure of the veins is in most cases distinctly ribboned. It should be observed, however, that the ribbon structure may be primary, due to the deposition; or secondary, due to movements along the vein, by which it has been divided into sheets. The first-named structure is very common and exhibited beautifully, for instance, along the heavy Gold Blossom vein, on which the growth of the layers, beginning from the walls and extending inward, is apparent from the comb structure of the quartz crystals. The clean, white quartz frequently also contains cavities beautifully lined with quartz crystals. The structure of the majority of the Ophir veins is such that one cannot doubt but that they simply represent once open fissures filled with gradually depositing material.

In thin sections of the quartz which has not been subjected to strong pressure subsequent to its deposition the individuals between crossed nicols extinguish uniformity and normally; very frequently, though, the strong pressure which had formed the fissures continued or recurred after the deposition of the quartz, and the gangue subject to such pressure became optically deformed, broken, crushed, and comminuted. The ore from the Gold Blossom shaft shows in a marked way these phenomena in a milder form. The large quartz grains can still be discerned, but each one either shows strong undulous extinction or is broken up in many grains with somewhat different optical orientation. In some parts of the slide the quartz is even crushed and comminuted, and a ragged and crushed fringe usually marks the lines between the grains. The galena, pyrites and zincblende have also been pressed and squeezed in between the quartz grains. Particularly in such pressed quartz the irregularly shaped fluid incisions become extremely abundant. Moving bubbles are sometimes seen, which did not disappear by heating to about 50° C.

The Altered Wall Rock.—The rock contiguous to the quartz veins, whether amphibolite or granodiorite, has usually been subject to a more or less intense alteration. This altered wall rock, to which the miners incorrectly give the term "gouge," is from a few inches to a few feet wide. Only rarely does the unaltered wall rock lie up against the vein.

The process and the final product of this alteration are similar in both rocks, and it may in general be characterized as a conversion into an aggregate composed of white mica, carbonates and pyrites, effervescing with cold hydrochloric acid. The amphibolite is changed into a grayish or white, fine-grained rock with somewhat greasy luster and feeling on the cleavage planes. It is usually filled with small cubes of pyrite. The mineral occurs much more abundantly in the altered wall rock than in the veins. The microscopical appearance is that of a sometimes coarse but on the whole extremely fine and felted aggregate of wavy or straight fibers of sericitic muscovite and grains of a carbonate, predominatingly pure calcite. Large, sharp crystals of pyrite are imbedded in this aggregate. Of other minerals there is a small amount of a colorless substance of undulous extinction and low interference colors, probably a variety of chlorite; further, white opaque grains which almost certainly are titanite altered from the titanic iron ore in the amphibolite. The mass is sometimes traversed by small veins of quartz which contain rhombohedrons of calcite.

The granodiorite altered in the same manner becomes a grayish green rock of slightly greasy luster and feeling. In the less profoundly changed rock the hornblende crystals are still visible as dark patches; but with increasing alteration a more uniform medium-grained product is the result. Pyrite is, as usual, very abundant, and foils of a green chlorite may sometimes be seen. This chlorite is distinctly biaxial with an optical angle of about 20°.

In thin section the granitic structure is usually still apparent. The former hornblende is indicated by foils of chlorite and an opaque grayish brown mineral, most probably titanite. Some quartz grains showing undulous structure still remain, and the outlines of some feldspar grains are still visible, but practically the whole mass is altered to an aggregate of calcite and white mica, in which the calcite often forms triangular or polygonal masses bordered by the straight mica foils. The remaining quartz grains show a corrosion by the secondary mica calcite aggregate, long foils of muscovite reaching into the quartz grains at some places. Crystals of apatite remain fresh. Some distinct leucoxene, inclosing unaltered grains of titanic iron ore, are also noticed. In some specimens secondary aggregates of quartz also occur.

The altered wall rock, in places at least, contains gold and silver. A sample from the Mina Rica gave 0.125 ounces Au. and 0.250 ounces Ag., or about $2.75 to the ton. The decomposed diorite from near the Gold Blossom vein northwest of the tunnel gave trace of Au. and 0.050 ounces Ag. to the ton. The altered amphibolite from the Gold Blossom tunnel gave 0.012 Au. and 0.098 ounces Ag. to the ton. Wall rock from the Gold Blossom shaft adjoining quartz, which assayed 0.5 ounces Au. and 2.15 ounces Ag., or $12 to the ton, gave trace of Au. and 0.20 ounces Ag. In all cases the altered rock was free from vein quartz.

* * * * *

The extensive carbonatization of the Ophir wall rock is very remarkable indeed, especially as the main fissures are almost completely filled with quartz and contain very little or no carbonates. In the researches of Sandberger and v. Groddeck, the process is usually rather a silicification instead of a carbonatization, even in veins containing large quantities of carbonates. A gneiss, largely converted into carbonates, is mentioned by Sandberger as an exceptional occurrence.

I think future investigation will show that this carbonatization of the wall rocks is a process which has occurred very frequently during the forming of the California quartz veins. The fact that each vein and veinlet is surrounded by a distinct, bleached and altered zone of greater or less extent—in the small stringers sometimes only a fraction of an inch wide—appears to me to indicate, beyond doubt, that the veins were filled with solutions acting with a certain intensity on the walls; in other words, that there can be no question of surface waters gradually percolating through the wall rock and depositing there dissolved substances, but rather of strong mineral solutions circulating in the fissures.

Some specimens of vein quartz show, on the faces adjoining the walls, small but distinct pseudomorphs of quartz after calcite. Taken into consideration with the carbonatization of the wall rock this may mean that the character of the solutions changed during the process of formation of the veins from predominatingly carbonated to siliceous.

Two facts referred to above should be accentuated: first, that the iron pyrites are more abundant in the altered wall rock than in the veins, and this not only in the iron belts of the amphibolite, but also in rocks originally not containing any pyrites; second, that although the wall rocks have been so radically altered by the solutions in the fissure, very little good is contained in them. They are, however, as shown above, not wholly impervious to the gold and silver solutions.

Distribution of Gold and Silver in the Veins.—It may be said with considerable confidence, though, of course, a more extended series of assays would be desirable, that all the quartz veins in the Ophir district carry gold and silver in notable though often minute quantities. The proportion of gold to silver varies from 1:1 to 1:10 or more by weight; the silver always predominates by weight, though not by value. A large portion of the silver is contained in the sulphurets, which usually contain much more silver in proportion than the ore, but the bullion obtained by ordinary plate amalgamation is only from 500 to 700 fine.

The richer ore in the pay shoots is nearly always characterized by more sulphurets than usual in the poor quartz. Galena is especially considered a good indication. The very crystalline and bright quartz in which no sulphurets occur is usually considered poor; in general this perhaps, holds good, but it may be said to be a most difficult feat to tell the approximate value of the quartz by its appearance. A specimen of very clean and crystalline quartz free from any sulphurets from the Rocky ridge gave, in spite of its very unpromising appearance, 0.187 ounces Au. and 0.263 ounces Ag., or about $4 per ton.

In the granodiorite the richer ore bodies are of considerable extent and their width and dip are not always known; still there are some, as the Crater hill ore shoot, for instance, which distinctly dip eastward in the plane of the vein. It is worthy of note that at many of them there is an amphibolitic dike rock adjoining the vein. The veins in which this is notable were shut down during 1892 and offered no opportunity of investigating this relation; it would seem, however, as if the dikes were of such small extent that the metals in the ore shoots could hardly have been derived from them alone. Moreover, one of the largest ore bodies, that of Crater hill, occurred without any such adjoining dikes, and several other smaller rich shoots have also been found at various places in the granodiorite without them.

In the veins of the amphibolite area the richer ore shoots are, on the whole, of small extent, though more extensive bodies of milling ore may occur. The usual width of these chimneys is from a few feet up to 50 or 60. As already stated, they dip eastward at varying angles on the plane of the vein, and the richest shoots are usually found in the crossing of the vein with the iron belts. In this case the ore bodies have certainly been enriched by leaching from the auriferous sulphides of the amphibolite. Pockets or rich ore shoots are also sometimes found at the crossing of the two veins, such as at the junction of the Little and Big Doig and at the junction of Good Easter with Morning Star. The rich ore shoots are usually of small depth, seldom exceeding 100 feet, but others may come in at any place when the vein is explored.

There is an accepted dogma of many miners that "the gold in the veins is a surface formation," or that "gold veins invariably become poorer as the distance from the surface increases." These are views which are based on a misconception of the data involved. It is correct to say that *one and the same ore shoot seldom continues beyond a depth of a thousand feet or thereabouts*, but thorough prospecting of the same vein would, in all probability, develop new ore bodies in other places on the level in which the old one was found to thin out. Of course it is not in every case certain that such thorough exploration of the vein would be a paying investment. When the ore shoot found at the surface gives out, the mine is often abandoned through lack of funds. It seems to be a characteristic of all gold quartz to form rich chimneys of limited extent, irregularly distributed in the plane of the ledge. There is a curious misconception abroad that the present surface is also the surface of the period when the veins were formed. Not only is the present surface cut down and eroded to a considerable extent, since the late Tertiary time when the auriferous gravels were deposited, but there is every probability that the surface at the time of the formation of the veins was far above the Tertiary surface.

The ore bodies of to-day are thus probably far below the croppings at the time the fissures were filled, provided that they reached the surface. Rich ore bodies now occur, as in the Washington, Nevada county, mines, about 3000 feet below the Neocene surface; they occur at the present surface, and they certainly also did occur above the Neocene surface, as evidenced by the rich Tertiary gravel. The veins may, on the whole, have been richer near the original surface, or perhaps only more numerous, but the occurrence of rich ore bodies at a depth of several thousand feet below it certainly appears to indicate that the limit where gold was no longer deposited from its solutions has not by any means been reached in our present mines.

Some Legal Points.

When one of the two innocent persons—that is, persons each guiltless of an intentional moral wrong—must suffer a loss, it must be borne by that one of them, who, by his conduct, acts, or omissions has rendered the injury possible.

Where a number of individuals assume to act in a corporate capacity in a State where they have not been clothed with corporate existence and authority, they cannot there be recognized as a legally constituted corporation, though they may have been duly incorporated in another State; and such persons, in the State where they assume corporate capacity, will be treated as, and held to the responsibility of partners, both in courts of law and equity.

The authorities leave no doubt that construction contracts, in which the contractor stipulates that the engineer or architect of the owner shall finally and conclusively decide, as between him and the owner, what amount of work has been done; and its character, and the amount to be paid therefor under the contract, are legal, and should be enforced.

To render a professed agent liable in damages to the person dealing with him on the ground of want of authority to bind the party for whom he assumed to act, such person must have dealt with him in ignorance of want of authority upon the faith that the agent possessed the authority assumed. Hence, when the agent, acting in good faith, fully discloses to the other party, at the time, all the facts and circumstances touching the authority under which he assumes to act, so that such party is fully informed as to the existence and extent of his authority, the agent cannot be held.

When I see a St. Louis foundryman coming to Chicago and secure a large order for foundry work by under-bidding the local shops and on the next train see a Chicago man going down to get back at him, I feel mighty certain the moulders' wages are not going to be raised until after that contract is filled. I feel sure they will be speeded up to the utmost on such close transactions.—Foundry.

Critical Periods in the History of the Earth.*

NUMBER VI—CONCLUDED.

By JOSEPH LE CONTE, of the University of California.

Re-isolation.—Lastly there come re-isolations of the mixed faunas and floras in their new positions; and geographical diversity again commences and continues to increase without limit in proportion to the time and degree of isolation.

Thus in the history of the earth there have been alternate periods of minglings and re-isolations of faunas and floras; of effacement, and re-establishment of geographical diversity. Every period of mingling has increased the force and quickened the rate of evolution and the diversity of organic forms.

As already shown, the glacial period is the last of these critical periods of migrations, minglings, struggles, and the present a period of re-isolations and increasing geographical diversity (except in so far as interfered with by man) and of readjustment of the whole organic kingdom to the dominant type, man. Therefore the glacial period furnishes the key to the present geographical distribution of species, especially among the higher forms, and conversely the present geographical distribution of species furnishes a key to the changes in physical geography and the directions of migrations of species during that critical period.

SUDDENNESS OF CHANGES AND RARITY OF TRANSITIONAL FORMS.

There are many important questions suggested by the foregoing discussion. Chief among these and the only one I now touch, is the question of the cause of the suddenness of the appearance of new organic forms, and the extreme rarity of transitional forms or connecting links at all times, but especially during the critical periods.

As already said, the greatest and most rapid of all these changes is that which occurred in the critical period between the Palæozoic and Mesozoic. We may therefore take this as the type in this regard. It is almost impossible to exaggerate the greatness of the change which took place here. Passing from the one era to the other is like going from one world into another. How shall we aecount for this great and apparently sudden change?

Lost Records.—The first and greatest cause, especially of the suddenness, is, of course, the loss of record. Certain leaves of the book of time are missing, and when we come to read again, the subject matter of the volume is greatly changed. This accounts for the absolute suddenness in some, but not for the greatness of the change, for this is out of all proportion to the lost interval of time. Therefore we must admit farther:

Rapid Steps in Evolution.—The steps of evolution were exceptionally rapid at this time. We have ready given the causes of this more rapid movement. But even when the record is recovered, as for example, in India, Australia, etc., we find still that connecting links between successive forms are rare—links are usually missing. Therefore it is necessary to remember also that there are

Few Generations Represented.—The changes being more than usually rapid, the number of generations necessary to accomplish a certain amount of change, *i. e.*, to transform one species into another, were comparatively few. Therefore when we remember that fossils were but a small fraction of the actual number of individuals living at any time, the likelihood of finding transitional forms is diminished to that extent. Again, add to this the fact of

Few Individuals in Each Generation.—The conditions must have been unfavorable to fullness of life. The changes in the environment were rapid, and therefore adaptations of organisms to the environment must have been imperfect. In a word, critical periods are hard times. But hard times react and produce less reproductive fertility, and therefore fewer individuals in each generation. Therefore critical periods are characterized by poverty of fossils, even when the record is recovered.

Migrations and Consequent Unconformity of Faunas.—Last of all among the causes, we must not forget migrations, which, aside from the rapid changes produced by severer struggles, produce also unconformity of faunas and floras, and therefore an appearance of suddenness of change in any one place. Such changes of species by migrations, although most conspicuous in critical periods, take place locally even in the quietest times and the most conformable strata, by changes of bottom from sand to clay or lime, or vice versa, produced by a change of currents, or slight changes of shore line.

Effect of Specialized and Generalized Forms.—Again, as to the nature of the process of change in the changing organism itself: Long continued prosperous times with unchanging conditions give rise to highly specialized forms, perfectly adapted to these conditions, but correspondingly unadapted to other conditions, in other words, to rigid forms, rigid through the accumulation of heredity for many successive generations on the same point. Generalized forms, on the contrary, are less perfectly adapted to any one set of conditions, but more easily adaptable to many kinds of conditions. They are a sort of Jack-of-all-trades and not very good at any. These are therefore more plastic to the moulding influence of a changing environment. Therefore long continued periods of quiet give rise to many specialized dominant forms, perfectly and rigidly adapted to these conditions. During the following critical period, these domiuant forms are unable to adapt themselves to new conditions. Too rigid to change with the changing times, they are destroyed, while only the few and less conspicuous generalized, and therefore plastic forms save themselves by modifications in many directions adapted to the new conditions. Thus all the old forms may quickly disappear, some by extinction, and some by modification into new forms, but all the new forms come only by modification of the old.

Periodic Law Universal.—But again, and lastly: Even in most prosperous times, and in the most continuous strata, with every evidence of great fullness of life, and when, therefore, the changes of species were slow and continuous, even under these most favorable conditions, still the links between successive species are rare. In nearly all cases progressive changes seem to take place by substitution of one species for another (of course following the line of evolution), rather than a transformatiou of one species into another. The same thing is observed in geographical distribution of species. In fact, there is great similarity in the laws of geographical and geological distribution of species—the distributiou in space and the distribution in time. Critical periods with their unconformities in the latter, correspond to great physical barriers in the former, for in both they separate sharply distinct faunas and floras. On the other hand, conformity with its gradual changes of species in the one corresponds with gradual changes of physical conditions in latitude and corresponding changes in species when there are no barriers. In both cases the changes of species are gradual, indeed, but usually, though not always, by substitution rather than by transformation. In the case of geographical distribution we easily account for this by the dropping out of intermediate forms in the struggle for life in all cases, and by migratious in many cases. How shall we account for it in the geological distribution?

Of course, in perfectly conformable strata, in case of change of material of the strata, we account for it largely by local migrations through change of bottoms. But the same is often true even in a continuous unchanged stratum. Of course, again we may attribute it, as Darwin, and many since Darwin have done, to the extreme fragmentariness of the geological record. But even when the record is complete, as it sometimes is, and the number of fossil species is fairly comparable to the number of living species in similar area and time, still the same fact is observed. There must be some other cause inherent in the very nature of the process of evolution itself. On this most difficult subject I throw out the following suggestions:—

I have already said that while the forces and laws of nature are uniform in their operation, yet phenomena, being usually under the influence of two opposite forces, one tending to change, the other to permanency, the one progressive, the other conservative, are nearly always paroxysmal. Resistance at first prevails and there is little or no change; but forces of change are meanwhile accumulating until finally resistance gives way and conspicuous changes take place rapidly. This might, if necessary, be illustrated from every realm of nature, but it is well recognized that all phenomena are more or less periodic or paroxysmal. Now in the case here in hand, the resistance or conservative force is heredity and the force tending to change or the progressive force is the pressure of a changing environment, physical and organic. Under these conditions, progressive movement or evolution must be more or less paroxysmal. By heredity the species resist change until at last the want of harmony with the environment becomes so great that the species must either change or die. Some accept the one alternative and some the other; the generalized forms change, the specialized die. When the change begins, I imagine, it goes on rapidly until equilibrium is again restored. The change being comparatively rapid is completed in a few generations. The steps of change are therefore represented by comparatively few individuals on that account. But again the times of change would have all the peculiarities of hard times. Not, indeed, hard times for all species as are critical periods, but for some particular species. Therefore the steps of change are represented not only by a few generations but also by comparatively few individuals in each generation. For both of these reasons, therefore, there would be a comparative poverty of fossils of intermediate forms until the neeessary change is completed, adaptation is restored, and life becomes abundant again.

In a word it seems to me impossible to account for the phenomena of the evolution of organic kingdom, and also for the rarity of transitional forms, unless we recognize a law of paroxysms in evolution, the greatest ones constituting critical periods and marking the primary divisions of time, the lesser ones the subdivisions; but the law entering into even the minutest details of suecession of species in the most tranquil and prosperous times.

CONCLUDING REFLECTIONS.

In couclusion, permit me to say, I have tried to give what seems to me, under the present lights, the most rational view coneeruing the primary and secondary divisions of geological history. I cannot for a momeut hope that the view here presented is final or even nearly so. There must coutinue to be evolution of thought on this as on every subject. In science, the last word is never said on any subject. Old views must give way to new, but let us not lose sight of the germs of truth eontained in the old. Evolution of thought must, indeed, continue, but let us remember that evolution is by modification, not by destructions and recreations. Ideas are like species. In the evolution of thought some, indeed, become extinct and leave no progeny, but some are transformed into new, and all the new come only by such trausformation of the old. All I can hope is that those expressed above are among the plastic ones, which will not be destroyed but chauged into higher forms.

THERE was a wonderful run on the New York Central R. R. on Sept. 11th, when the distauce of 436¼ miles from New York to East Buffalo was covered in 407 minutes, exclusive of stops, averaging 64.348 miles an hour; or iuclusive of stops in 414.27 minutes, averaging 63.192 miles per hour. This is the greatest example of sustained speed for a long distance ever given in this country and probably in the world; although the American representative of the London and Northwesteru railway writes that in the great race from London to Aberdeen on August 22, a distance of 540 miles, the West Coast train averaged 64.158 miles an hour exclusive of stops and 63.281 miles an hour iuclusive of stops, which, if eorrect, would show a very slightly higher average, .089 of a mile an hour exclusive of stops, although the American rate inclusive of stops is still ahead. But it must be remembered that while the English run was more than 100 miles longer than the American, the New York Central train of four cars weighed 232½ tons, while the West Coast train of three cars weighed only 68 tons, a great handicap of 164½ tons against the American race.

A MINIATURE world has been made by four French scientists, and is being exhibited at Paris. The globe is 42 feet in diameter, and has painted upon its outsides all known details of the earth's geography. The building in which it has been placed is eight-sided, has an iron and glass dome and is well provided with elevators and stairways, so that a visitor can easily examine "all parts of the world." The globe weighs 13 tons, but is so nicely balanced that it can be rotated by a small hand wheel. The surface area is 525 square feet, which is sufficient to exhibit all the mountains, rivers, islands, and cities, and even the principal thoroughfares of the latter.

THAT was rather an amusing circumstance related by a Mr. Wanner at the last meetiug of the Philadelphia Foundrymen's Association as showing a side of humau nature that is only too often displayed. A pipe foundryman had purchased a large amount of pig iron at the prices ruling early in the year when some grades sold down near $9 per ton. Afterwards he took an order for a large amount of heavy water pipe at a price that would have netted him less per ton than a re-sale of his pig iron would have brought him. Surely the desire for competition or the craving for orders at any price must amount almost to a mania with some people.

Mining Summary.

CALIFORNIA.

Amador.

MIDDLE BAR AND HUNT'S GULCH.—In Hunt's Gulch ten stamps are running on ore taken from the Amador Queen mine, which is being crushed hy ten stamps in the sixty-stamp mill of the Amador Gold Field's mill hy James E. Dye.

Eight men are at work on the Doyle mine sinking a new shaft. Mr. Moore of Sonora is the superintendent.

THE NEW YORK BONDED.—*Record:* G. W. Andersou of the New York mine, three miles down Jackson creek, has sold or bonded that mine to San Francisco parties, who will in a short time commence operating upon a large scale, under the name of the Evening Star Gold mine, and will put up a mill and work it this winter, and they feel confident of opening up a rich mine hy sinking deep and getting rich rock that will pay well.

THE AMADOR QUEEN. — *Republican:* Ten stamps of the Amador Queen mill have hee n started on refuse rock. This is to get the mill in good working shape for the test crushing, which will commence next week. It is proposed to run through about 300 tons of ore taken from the bottom of the shaft. The plates are resilvered, and everything has heen done to make the test a fair one as far as the gold-yielding properties of the rock hy mill process are concerned. The ledge is large enough to keep forty or sixty stamps running steadily. If the rock mills $3 per ton a hig mining industry will he developed at this point.

AT THE BAY STATE.—At the Bay State mine, Plymouth district, the mill is running to its full capacity, crushing ahout 20 tons per day. There are four ore chutes on the 600 level to the north and south of the shaft, with a total length of 270 feet and an average width of 6 feet. It is believed that all these ore bodies will unite as greater depth is attained. East of this there is another very heavy hody of quartz in which a crosscut was run to the 300 level, penetrating the ledge 14 feet without encountering the hanging wall. The rock is very hard and compact, and for this reason no further work will he done in that direction until power drills are put in position.

Butte.

AT ENTERPRISE.—E. W. Slater has five men working on the E. W. quartz mine, while two tunnels have heen driven on the gravel mine he owns lower down the South Fork. One tunnel is in 225 feet and the other is in 900 feet.

Rothwell & Bachman, who own the North Star quartz mine above Enterprise, are making arrangements to put in a ten-stamp mill.

THE GOLDBANK MINE.—*Mercury:* At the Goldhank mine, near Forhestown, work in the tunnel has heen suspeuded in order to allow the laying of a new foundation for the air compressor and other machinery. It is thought this will take ahout a month's time. The tunnel is now in 1050 feet, and it is thought that 150 feet farther will tap the ledge.

Calaveras.

GENERAL IMPROVEMENT.—*Chronicle:* A water power hoist and a ten-stamp mill are now in process of erection on the Keystone mine uear Railroad.

The water power hoist, which is in course of constructiou at the Infernal gravel mine, is nearly completed, and will he in running order in ahout ten days.

M. Provard, owner of the Vorlander mine on the Mokelume river at Middle Bar, intends putting up a steam hoist.

The Gwin mine shaft has now reached a depth of 1,000 feet. The sixty-horse power engine is nearly completed and will be ready to run in a short time.

TERMS OF THE TULLOCH SALE.—The Brown, or Tulloch mine, at Alhany Flat was sold for $50,000 on the following terms: $10,000 cash down, the remaining $40,000 to be paid on or before March 8th, 1896. The parties to receive payment are Mrs. J. C. Tulloch and A. Magruder, who share a like interest in the property.

The Pure Quill mine is being worked with two shifts of men, who are employed to take out ore to he worked as a test. Should the test prove satisfactory the Godhe Co. will open up the property in proper shape.

The Tiberghien mine at Smith's Flat has heen sold to James Smadeke for $5000. One thousand dollars have been paid, aud Mr. Smadeke agrees to pay the balance in monthly installments of $1000 each.

Lassen.

LONE PINE MINE.—Judge Goodwin, and his son, W. N. Goodwin, of Susauville, have bought a ten-stamp quartz mill of D. McIntyre, Greeuville, to he delivered at the Loue Pine mine. The Lone Pine mine is at the foot of Diamoud mouutain. The shaft is down ahout 150 feet and the vein of ore is hetween three and four feet in width. It prospects $10 per ton.

Mariposa.

THE MERCED G. M. CO.—Under date of Sept. 21, W. C. Ralston writes to the *Engineering and Mining Journal*, of New York, regarding this mine, his letter appearing in that journal of date Sept. 28, as follows:

"In the last two or three editions of your valuable journal have appeared letters condemning and criticising the Merced gold mine, which is situated at Coulterville, in Mariposa county, California. Your last issue contains a letter, signed by 'C. E.,' dated Kansas City, Mo., Sept. 16, 1895, and, with your kind permission, I will reply to the same.

"Wheu 'C. E.' says that 'he believes this mine (the Merced) the most daugerous mining investment that has been offered to the public in this country in many a day,' he makes a statement which is not true. Pardon my flat contradiction, but I am speaking from actual knowledge of the property, although not interested in the stock in any way. The Merced mine (formerly known as and called the Seth Cook mines) is on the famous 'Mother Lode' of California, and comprises several mining locations. The lode here is as wide as it is anywhere, and more free gold was visihle on the croppings than in almost any other section. That the Cooks worked it at a loss is no proof of its not heing a valuahle property, for we all know the history of the Utica, the Kennedy, the Keystone and other mines, which were not worked at a profit until depth was attaiued. 'C. E.' evidently has never visited Coulterville, nor do I helieve that he is posted on the history of the Mother Lode in California. Every mining expert of known repute, who has examined the Merced properties, has stated that they contained very large shoots of low grade ore. To he sure, there is some worthless ore in a 30-foot ledge. That is always the case. I would he pleased to hear the name of any expert who has examined the Merced properties and who, speaking of them as an investment, says they are 'too poor to pay and too rich to let go.'

"John Boyd, of San Francisco (who married Mr. Seth Cook's sister and to whom these properties helonged), told me that the Boston & Montana people, through Mr. Couch, spent over thirty days sampling and making working tests hefore purchase. Mr. Couch is regarded out West as a very capable miner, and it does not seem possihle that he could have erred in his purchase. Does 'C. E.' know that at $3 per ton the Merced properties can pay handsome dividends and, I believe, pay good interest on the present value of the stock? Is 'C. E.' aware of the fact that the Tyro mine, which lies directly south of one of the Merced mines (the Malvina No. 2) milled over 3 feet of ore for many months, which averaged over $23 to the ton, and that they worked up to the Malvina line? There was rock at the collar of the shaft on Malvina No. 2 last year which gave me fine results in panning.

"In making the following statement I court contradiction and discussion: I coutend that nowhere to-day in the gold-hearing zones of the known mineral world does there exist a better field for iuvestment than upon the mother lode of California, not even excepting Africa. For some unkuown reason California has heen spoken of as a gold producer of the past, and the impression has prevailed that she is declining in her gold production. Such is not the fact, and I venture to say that within two years California will again reach the $20,000,000 mark for her annual gold output.

"Regarding the present market value of the Merced stock, it is absurd for 'C. E.' to hold the Bigelows respousible. They listed the Merced mines at a fair valuation: the gambling public have seen fit in trading upou the market to raise the value of the stock. I would rather buy Merced to-day, at present prices, than any South African stock offerod."

Nevada.

ONE MONTH'S RUN.—*Telegraph:* 208 ounces of gold nuggets is the result of one mouth run from the Bald Mountain Extension gravel miue.

MINING GROUND SECURED.—*Transcript:* A patent has heeu secured hy J. D. Hague for certain mining ground lying between Gold Hill and Scadden Flat, known as the Watt and Judd ground. With the Scadden Flat property, lately secured, it completes an extensive chain of claims hetween Gold Hill and Allison Ranch. The late patents include conveyances from C. E. Clinch, the es'ate of Wm. Watt, and the heirs of Ben McCauley. The claims were located in 1854 hy Melville Atwood, the well-known mining engineer and mineralogist, aud hy other parties, and in early days were exceedingly rich.

THE MANZANITA MINE. — The Manzanita mine, near Sweetland, has started up. Twenty men were put to work last Monday. The company got a permit to hydraulic. Charles Miller of French Corral is superintendent.

A NEW MILL.—*Union:* H. Jauch of Washington, who owus a mine a few miles ahove that place, will soon begin the erection of a new five-stamp mill on his mine.

Placer.

ON AMERICAN BAR.—A ten-stamp mill will be put up on T. C. McCall's quartz mine on American Bar, near Michigan Bluff. Captain G. A. Nihell will superintend the construction. The quartz will be carried to the mill over a tramway 1,800 feet long. The ledge is from 50 to 100 feet in width, the ore low grade.

Plumas.

MADE FIFTY LOCATIONS.—*National-Bulletin:* C. C. Smith, Supt. of the Golden Ancient Channel Consolidated Mining Co., during the summer has been conducting work on his company's property situated on a branch of Bear Creek, which empties into the Middle Fork of Feather river at a point southwest of Quincy. He and his associates, residents of Santa Clara county, made fifty locations, covering 1,000 acres and ahout six miles of the supposcd channel. They have been sinking a prospect shaft, which is now dowu 83 feet. After passing through a lava cap of 47 feet, a stratum of pipe clay was encountered. The shaft is expected to enter gravel soon. Pumping machiuery will be put in to handle the water and sink faster.

Shasta.

CHROME ORE.—The Dunsmuir *News* says that a miner inspecting the chrome mines on Little creek has found a mountain of ore there. Some of the property is owned hy the Hearst estate and some by J. Champion.

MOUNTAIN MINING CO.'S OPERATIONS.—Two miles of the eleven miles of grading for the narrow gauge railroad from the mine to Keswick are finished. The estimated cost of the road is $110,000. There is a three and one-half per ceut grade. A $5000 steel furnace will be put in place as a starter. To every 100 tons of ore will be added 20 tons of silicious ores. The calculation is that each 100 tons will turn out 10 tons of copper matte, carrying ahout 45 per cent. of copper, which will he shipped to the refinery. It is stated that all the coke used will be of English importation. The present payroll is $20,000 monthly.

Siskiyou.

GENERAL MINING NOTES.—*Union:* Espey, Hunter & Co. are running their hydraulic mine at Hawkinsville with full force, the pumps raising water to the flume from Shasta river.

Austin & Co., of the blue gravel mine at Greenhorn, are making exteusive preparations in readiness for commencing work again on a large scale as soon as the winter rains commence.

The American Bar Co., working in the hed of Klamath river, near Ash creek, continues to find rich prospects and considerahle gold in the old chauuel.

The shaft at the Steamhoat mine, McAdams creek, is down 80 feet, with 40 feet more to hed rock. When the hed rock is reached and prospected, to prove rich, a drain will he built down the creek towards Fort Jones, commencing about 40 feet ahove hedrock, as there will he no difficulty in keeping the water out hy pumping to 40 feet distance. The creek runs a great quantity of water, which comes up from bedrock to within 6 feet of the surface in winter, and 12 feet in summer.

Sierra.

THE ALASKA MINE.—A settlement of the Alaska mine's affairs has heen made, subject to the approval of all creditors, hy which the Alaska and Grizzly mines are sold at ahout $28,000, upon sixty days time. Out of this sum the two mortgages upon the property are to be paid off, and $10,000 applied toward the satisfaction of the other indehteduess upon the property. This latter sum will pay the lahor claims in full, less attorney's fees and costs, and will pay ahout 50 cents ou the dollar to creditors for demands other than for lahor. Five hundred dollars have been paid to hind the hargain, and $500 more are to he paid when all demands and claims are assigned to F. D. Soward, and the balauce of $9000 in the sixty days. The *Messenger* understands most of the creditors have already agreed to this plan of settlement, and it is thought that all the creditors will agree to it in a short timo. It is reported that an Englisb company will take the mine and begin operations as soon as the title is cleared.

Tuolumne.

THE STAR MINE. — The Star mine, three miles northeast of the Italian Bar bridge, on the South Fork of the Stanislaus river, now shows a vein three to five feet in thickness, opened by tunnel and drift. It is heavily sulphuretted, containing copper, zinc, lead and iron. The value of the sulphurets is from $500 to $700 and over per ton. A ten-stamp mill is beiug built at the Union Iron Works, to he in active operation on the mine in sixty days. Wilhur Long is superintendent.

NEVADA.

THE COMSTOCK MINES.—Dan De Quille in S. L. *Tribune:* At the Brunswick lode a line of water pipe is heing laid to the new workings from the Combination shaft, and preparations being made for the erectiou of hoisting works, the machinery for which is being constructed. Nothing will be known of the value of the Brunswick vein at the points where work is heing done until crosscuts are run, as the inclines are heing put down outside of the quartz in the foot-wall.

The average of 398 tons on Consolidated California & Virginia ores worked at the Morgan mill, Carson river, during the past past week was $27.53 a ton. The company have shipped to San Francisco $11,203.50, and have ou hand in their assay office $14,000. They are at present doing a considerahle amount of prospecting and development work. A new two-compartment upraise is heing made on the 100 level, and a new exploration drift will soon he started north on the 1000-foot level where much virgin ground remains to be examined. Ore assaying from $2 to $8 a ton is now heing found in a prospecting drift on the tunnel level of the old Ophir works. The Hale & Norcross, Chollar and Potosi are extracting ahout the usual quantity and quality of ore; the Hale & Norcross ore assays $65.52 a ton. The Crown Point people have 500 tons of ore in their ore-bins, and are engaged in exploration work pending a milling stage of water inthe Carson river. Owing to the lack of water iu that stream, most of the Gold Hill mining companies are now engaged in prospecting and making repairs. In several mines down there and in this city promising streaks of ore are heing followed. From these streaks a considerable amount of good ore is being saved at some points.

The mines of Silver Star, Esmeralda county, are improving.

The Silver Peak mill, near the southern extremity of Esmeralda county, has made its first cleanup. It amounted to $13,000.

Eastern parties are honding mines in Union district, Nye county, and work is heing started up on gold properties near Ione.

At Osceola those placer miners have taken out over $1500 in less than three months.

At the placer mines in Sadorus district, Elko county, miners are making good wages. Four men who have a gang of twenty-one Chinamen at work for them, clear $4 a day on each, aud the Chinese get $2 each, hesides what they steal. Three men in another claim take out $12 a day. Men working there with dry-washers are making good wages. It is said that "a peculiarity of these placers is that the richest grouud is found on the mountain side, instead of in the hottom of the canyon as usual." Here is a hint for some quartz prospector.

At El Dorado canyon, on the Colorado, a company has bought twenty mines and will work them in good shape. This is a camp of many hig low-grade gold veins. In the early days 700 claims were located in the district. These mines are six miles from the Colorado river. A big electric plant will he erected on the river, which will furnish power on the ground for hoth mining and milling.

The El Dorado canyon mines are in Lincoln county, in the extreme southwestern part of this State. Near King's river, thirty miles east of Nevada and Arizona, a new mining district is heing opened that promises well. The veins are large and rich in free gold. There are also in the district hig veins of copper carhonates that run high in gold. These mines are seventy miles from Winnemucca, which is the nearest railroad point.

The bodies of two prospectors, supposed to have perished of thirst, were recently found on the road leading to Death Valley.

AT DE LAMAR.—The De Lamar Gold Mining Company of Nevada are doubling the capacity of their mill, hy adding more rolls and pulverizers. This will make the capacity of the mill 120 tons per day; the addition to the mill will he completed by the time the new pipe line is laid from Meadow Valley Wash, a distance of twenty miles. The Swifter mine, which adjoins the April Fool, was sold last week.

OGDENSBURG AND ST. LAWRENCE. — The Ogdensburg and St. Lawrence is the name of a mine that C. G. Fiske and sons have been working at for years, says the *Herald*, hut not until recently have they got it opened so as to work it profitahly. The gold is all coarse, and it is not an uncommon thing to find nuggets ranging in value from $5 to $20. Some of the richest ground in the county has been in the neighborhood of the Fish mine, at the head of Fall ereek, and it looks as though tbe Ogdensburg and St. Lawrence would prove to he as good as the former claims.

HAS NOT SUSPENDED OPERATIONS.—Virginia City *Chronicle*: The Sutro tunnel has suspended operations. It closed down last night and the shift of five men were laid off. The cause of the suspension is said to be a lack of ready money to pay expenses with. The company has heen unable to pay the wages of the men for a couple of mouths. Funds will probahly soon he forthcoming to resume operations on. (The *Enterprise* authoritatively denies this and says work is going right on.)

OREGON.

JOSEPHINE COUNTY.

Courier: Before the fall rains set in there will he nearly one hundred hydraulic mines in Josephine county ready for the giant. This is an immeuse number, hut it is nevertheless a fact. There are employed at these mines from two to thirty-five men for each mine. Perhaps five hundred men mako their livelihood hy working directly in the mines.

WASHINGTON.

Nelson Bennett and M. B. Stacy have ceased operations on the mines recently purchased hy them in the Fish Lake country. The avorage of two cars of oro sent to the smelter was only $14 per ton.

BRITISH COLUMBIA.

THE WAR EAGLE.—*Miner:* The War Eagle mine has put out and shipped 7015 tons of ore to date. The last 27 shipments, amounting altogether to 2300 tons, brought an average return from the smelter of $48.30 per tou. From this must be deducted $10.50 for freight and treatment, $2 per ton haulage to Trail, and $4 for mining, leaving a net profit of $31.30 per ton. A new tunnel is now being run in from helow to tap the vein, which it is expected to reach in 1800 feet. Two new boilers, of 100 horse-power each, are under order and are exnected to arrive shortly. They will he used for driving from 10 to 12 drills. The driving power will he located in one place and will be availahle hy means of compressed air to operate drills in any part of the mine.

GENERAL NOTES.—Mining in the old Cariboo country of British Columhia has heen very active during the summer. Expensive machinery has heen taken in and prospecting has heen carried on to a greater extent than ever before. The preparations for an active season in 1896 are heing perfected. These mines are fully 300 miles north of Ashcroft on the Canadian Pacific railway, and all supplies, machinery, etc., are hauled or packed in. The properties in this remote district are largely owned by Vancouver and Victoria capitalists.

It is reported that the smelting plant which has heen at Golden for a numher of years, hut never operated, is to he dismantled and removed to Midway. A syndicate represented hy S. S. Fowler, M. E., of Chicago, and W. T. Thompson of Fairview, have the matter in hand, and will erect a fifty-ton smelter.

The rumors recently that the Slocan Star had heen sold to a Canadian Pacific syndicate are denied hy Byron White. "It has never heen offered for sale," he said, "nor would it be sold at the price reported, $1,400,000."

A. B. Henryx of the Pilot Bay smelter says that in future his establishment will divide its patronage hetween all the roads. As a result of this decision the steamer Nelson last week moved eighty tons of hullion for shipment via the Spokane & Northern and the Great Northern to Aurora. Heretofore the Canadian Pacific road has had a monopoly of the entire carrying trade of the smelter.

LARGE CAPITAL SUBSCRIBED. — A Victoria dispatch of the 1st says: F. S. Barnard, M. P., who has just returned from England, was successful while there in forming a syndicate comprising banking houses of London, Paris, Berlin, Amsterdam, Glasgow and Manchester, to develop the gold fields of British Columhia. The capital of the syndicate is £300,000, of which £232,500 is availahle for immediate use. Barnard is to be managing director, and has gone to Kootenay.

THREE CLAIMS BONDED.—P. Aspenwall has given Mason and McKinney, of the Trail Mining Company, a thirty days option on his interest in tbe Kootenay, Copper Jack and

Tip Top claims for $40,000. The Rossland *Miner* says the taking of the option means a sale, the thirty days time being given in order that Mason, Hoge and McKinney may obtain the ratification of the board of directors of their company in Illinois. Mason is president of the Trail Mining Company, which owns and has been working the Columbia mine. Hoge is one of the directors and McKinney the treasurer of the company. Messrs. Mason and Hoge are members of the firm of Mason, Hoge & Co., who now have under construction six miles of the Chicago drainage canal at the price of nearly $1,000,000 per mile.

IDAHO.

THE YELLOW JACKET.—The forty stamp mill on the Yellow Jacket mine will soon be increased to a sixty stamp. A good wagon road has just been completed from Salmon City. The amount of ore the company can work by open cuts is estimated at one million tons. One vein averages $80 a ton, and another, twenty to twenty-five feet wide, runs from $6 to $7. Two or three other companies are operating in the vicinity of the Yellow Jacket, and there is talk of having lixivintion mills erected, and additional stamps put in their mills. When the Yellow Jacket mill is increased to sixty stamps it will crush at least 200 tons per day. Much of the ore is in a half pulverized condition. The company's receipts at present are from $25,000 to $30,000 a month.

MONTANA.

THE SNOWSHOE GROUP.—The company owning the Snowshoe group of mines near Libby is building a concentrator with a capacity of 100 tons per day.

UTAH.

THE ONTARIO TUNNEL AND ELECTRIC PLANT. The Ontario mine, formerly so wet, is no longer famed in that regard, the new tunnel successfully draining it, the flow of water being utilized by an electric plant. It has taken six years to build the tunnel, at an expense of $466,753, a distance of 15,494 feet. The annual saving over pumping is $164,000. An electric plant, with power supplied by the stream of water, lights the mine and runs the mills and lights Park City. There is a steady flow of water of 800 cubic feet per minute and an available fall close to the tunnel mouth of 125 feet in 380 feet. There is an overland route six and a half miles in length. The hydraulic plant is located 1600 feet from the mouth of the drain tunnel; water is brought through a flume and ditch to the pressure-tank, from whence it is piped to a three-foot Pelton wheel. The dynamo furnishes 2500 volts, with a full-load current of twenty-five amperes. Seven hundred 16-candlo power lamps are supplied at 110 volts. Three motors are used, one of twenty-five-horse power and two of fifteen-horse power, and everything works satisfactorily.

MERCUR PROPERTIES LEASED.—*Tribune:* G. Dorsey of Nebraska, J. Dern, manager of the Mercur, E. H. Airis and J. Heimrich, respectively secretary and treasurer, have a working lease and bond on a group of ten claims belonging to the owners of the Sunsbine and adjoining the incorporated properties of that company on the south. The terms were $100,000, the deeds to be placed in escrow, a cash payment of $5000 and a contract to do $100 worth of assessment work on each of the ten claims between now and the 1st of January, 1896.

SOUTH DAKOTA.

THE MOFFATT PROCESS.—*Pioneer:* The Moffatt oxidizing process will be in operation at Pluma by the first of November, as the company is putting in machinery in the old Taylor cyanide building. Articles of incorporation have been filed at Pierre, with a captal of $500,000. Many of the miners who operate on a small scale are holding their ore at present, intending to give the new process a trial.

COLORADO.

A TEN DAY'S RUN.—A ten day's run on Cripple Creek low grade ores enabled the Metallic Extraction Works, at Florence, to ship to the United States mint at Denver a $20,000 gold ingot. The works are treating about 125 tons daily.

TO MINE IN PITKIN COUNTY.—The Silver Diadem Mining Company has been incorporated, to mine in Pitkin county, with offices in Aspen and an authorized capital stock of $100,000. T. G. Lyster, Orin S. More and R. G. Withers are the incorporators.

ARIZONA.

THE TUCSON SMELTER.—The Tucson smelter blew in Sunday night and Monday was working a full force. Three eight-hour shifts are being run and about twenty-five men employed. There is sufficient ore on the dump for a twenty day's run. All conper ores will be brought and cash paid for them. There were forty applicants for work that could not be supplied.

TO RESUME.—*Miner:* J. W. Gerritt has at last settled the affairs of the Oro Plata and Ninety-Three mining companies satisfactorily to the creditors, and the two properties will resume operations Monday. The mines are among the richest in Arizona and will be made to produce heavily during the next two or three months.

MEXICO.

SONORA.—At Lampazos, the Cleveland & Montezuma Mining Co. turn out about $30,000 worth of silver bullion monthly, which goes to the mint at Hermosillo for coinage. They have a mill which reduces about forty-eight tons of ore every twenty-four hours.

SOUTH AFRICA.

APPRECIATION OF MINING SHARES.—The aggregate appreciation of South African mining shares in the last twelve months is almost beyond comprehension. The importance of the advance may be seen from the fact that the companies working the Witwatersrand district alone, having a nominal capital of £16,000,000, are now quoted in the market at prices which give an aggregate market value of £86,000,000. The appreciation in the market value of the shares of those companies alone between the end of March and the beginning of September was £60,000,000, nearly $300,000,000. All that, however, represents but a small part of this wonderful inflation that has gone on in twelve months. Mr. Cecil Rhodes' Chartered Company of British South Africa had a market value a year ago of £4,000,000 for the entire stock. It now has a valuation of over £18,000,000, an increase of $70,000,000. The shares of the De Beers Diamond Company now have an aggregate market value of £12,000,000, as compared with a little over £94,000,000 a year ago. Here is an appreciation of value in a year of $410,000,000. A remarkable feature of the market is the fact that the great advances in quotations are almost wholly found in those securities which pay no dividends. An old speculator once said that he liked the shares of the Erie road because there was no blinked nonsense of dividends about them. This seems to be the situation with the mass of speculators in the European mining markets. When once a company becomes a regular dividend payer it settles into quietness. Indefinite prospects seem much more attractive to the speculators than cash returns.

Coast Industrial Notes.

—About 16,000 feet of steel pipe is to be furnished and laid and a dam and reservoir built for a water system at Rossland, B. C. B. C. Rihlet is the constructing engineer.

—Secretary of the Navy Herbert will award the contract for building one of the new torpedo boats to Moran Brothers, of Seattle, Wash., at their bid of $160,000.

—San Franciscans who have secured control of 10,000 acres of land near Hanford will raise sugar beets. Claus Spreckels has agreed to build three sugar refineries in the San Joaquin valley and take all the sugar beets raised in the vicinity.

—The Mariposa *Miner* says that the proposed new railroad to the Yosemite from a point in Merced county will be constructed; that a corps of nineteen engineers is now in the field, and that Coulterville will be connected with the main line by a branch.

—Seventy-five men are building an 18,000 ft. flume to carry the waters of the South Yuba to the power house of the Nevada County Electricnl Power Co. The flume and dam will be finished by November 1st, when the company will install its plant, two 500 H. P. generators being put in at the outset. Messrs. Hasson, Hunt and Eckart of this city have charge of the electric part of the work.

—The Chino beet sugar factory, which began operations July 9, has turned out for the season nearly 28,000,000 pounds of fine sugar. This is the biggest concern of the kind in the United States. The outfit represents an investment of nearly $1,200,000. For labor and supplies over $500,000 is paid out every season. The average beet crop is twenty tons to the acre, for which the factory pays $4 per ton. About 25,000 gallons of petroleum are daily consumed in the boilers, which is piped from Puente, fourteen miles distant.

—The Southern California Mountain Water Company has incorporated at San Diego; capital stock $3,500,000. It succeeds the Mount Tecarte Company in constructing the irrigating system of that company, including four dams, calculated to irrigate most of San Diego county south of the San Diego river and west of the main range. The lower Otay dam is already half completed, and a big blast of nitro-glycerine is to be exploded on the 6th to dislodge 150,000 tons of rock. The company has expended $100,000 this year, mostly in preparatory work.

—The Great Northern Railway Co. has let a contract for 1000 box cars, a step taken in expectation of a heavy increase of tonnage upon that line. They are to be built by the Haskell & Baker Car Co. of Michigan City, Ind. Under the contract, exclusive of Washington fir and cedar, some 6,000,000 feet will be required. The average cost of a box car is $500. The lumber that goes into it is worth less than $50. Ninety per cent. of the cost is represented in iron, labor and profits. The order of the Great Northern road is worth to this coast about $40,000. If the cars were made here it would be worth nearly $500,000.

—A survey is being made for a narrow gauge railroad from the copper mines near Grant's Pass, Or., to Chetco, a distance of forty miles. From Chetco it will join the Hobbs, Wall & Co.'s railroad to Crescent City. The main object is to get an outlet for the copper to be shipped from the copper mines to the Eastern markets and to San Francisco. The copper will be shipped from Crescent City to its destination by steamer. The Siskiyou mines at Wheeler City and the Elmer-Brown mines at Waldo are to be joined together by a narrow gauge railroad. Captain Wheeler has bought here the machinery to put the mines at Waldo in shape for operations.

—The jetty at the mouth of the Columbia, between Oregon and Washington, is nearing completion. Major Post, United States engineer, who has charge of that work, states that October 15 the shipping of rock to the jetty will be discontinued, and the work closed down, and he does not expect that it will be resumed again. During the past season 206,000 tons of rock have been put on the jetty, and about 216,000 tons since October 15, 1894. The jetty is one of the most successful works of the kind ever constructed, and the cost has been far within the estimates. It was begun 10 years ago, when there were only from 18 to 20 feet of water on the bar at the mouth of the river, and even that could not be relied on, as the sand was constantly shifting. The jetty is 4½ miles long. The estimated cost was $3,700,000, and the actual cost will be $1,900,000. The amount of stone used in building the jetty will amount to about 940,000 tons, and so well has the work been arranged and managed that this rock has been placed on the jetty at an average cost of $2.30 per ton. This includes the first cost of the rock, cost of towing plant, superintendence and everything.

—The government jetty at the mouth of San Diego harbor is now built out into the ocean a distance of 3350 feet. A wing wall of 300 feet is being built toward the ship channel. Up to the completion of the work for this year the work has required 46,500 tons of rock and 7770 cubic yards of brush. When the jetty is fully completed, according to the present plans it will be 7200 feet long, requiring 110,000 tons of rock and 9000 cubic yards of brush. The cost will be about $250,000. This jetty concentrates the tide in one channel across the outer bar, thus deepening the entrance to the harbor. A similar work at the mouth of the Columbia river has been very successful, the depth of water in the channel there being now thirty feet.

—Till recently it was supposed that the efforts of some San Francisco men to get control of a portion of the Los Angeles oil-yield for direct local consumption would result satisfactorily. Over $500,000 was ready for investment. The idea was to pipe it at a cost of eight cents a barrel, pay fifty cents for railroad transportation, and with a cost of ten cents a barrel for handling here, have it aggregate sixty-nine cents in San Francisco. It sells here now for $1.25, and three barrels are accounted equivalent to one ton of coal. The ultimate intent was to build a pipe line from Los Angeles to Santa Monica or San Pedro, put on two tank steamers, and bring it here by water. But it is understood that the Los Angeles people have made such conclusions and arrangements with the Standard Oil Co. that that concern has secured control of about six acres of the oil district. It is thought that over three thousand barrels daily could have been disposed of in this city, with a great corresponding saving in the fuel bill, but since the deal with the Standard Oil people the San Francisco projectors of the scheme have ceased to take any present active interest in the matter, so far as the Los Angeles district is concerned. Meanwhile there are other oil fields, and the local demand exists.

Personal.

GEO. MAINHART has assumed the superintendency of the North Banner mine.

W. C. RALSTON has returned from an extended sojourn on the Atlantic slope.

JOHN W. MACKAY and Jas. L. Flood are investigating some mining properties in El Dorado Co.

C. OSBORN, for twelve years superintendent of the Virginia Gas Works, has gone to Santa Cruz to take charge of the Santa Cruz Light and Power Co.'s business.

LESLIE SIMSON, till recently assayer at the Selby Smelting Works, has accepted a position with the Simner & Jack Mining Co., Johannesburg, South Africa.

GEORGE H. THOMAS has resigned his position as manager of the Princess mine, on Magalia ridge, Butte Co. C. H. Schiveley of Oroville has assumed the duties of that position.

Delegates, Attention!

There will be found on another page of the PRESS a general invitation to delegates to the Miners' Conventiou and all mining men, issued by the National Base Ore Reduction Company, to visit its works, near Shell Mound, Oakland, and investigate its new and cheap process for handling all refractory ores. Mr. A. J. Robinson, the general manager, will be pleased to see those who are interested, at the company's principal office, room 170, Crocker building.

Obituary.

IRA P. RANKIN died of pneumonia in this city last Tuesday. He was a native of Massachusetts and was 77 years old. He came here forty years ago, and in '58 started an iron foundry with Mr. A. P. Brayton, now at the head of the Pelton Water Wheel Co., as partner. The foundry was afterward known as the Pacific Iron Works till sold to the Union Iron Works. Mr. Rankin was one of the pioneers in that business on this coast and occupied an honorable place in business and philanthropic circles.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

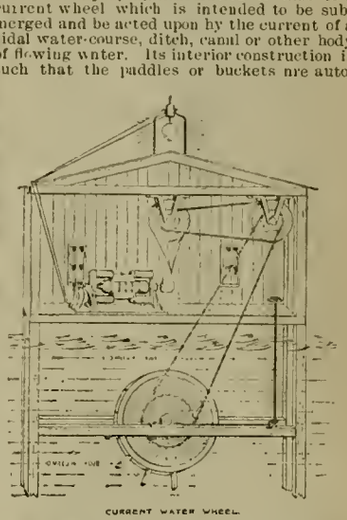
FOR THE WEEK ENDING SEPTEMBER 24, 1895.

546,649.—SASH FASTENER—Ann E. Bray, Los Gatos, Cal.

546,730.—AWNING—T. J. Daniels, San Francisco.

546,854.—WINDOW OPENER—Holdbrook & Beals, Couperville, Wash.

546,960.—PRESERVING TIMBER—F. A. Lobert, National City, Cal.



546,904.—TELEPHONE SYSTEM—Salisbury & Dean, Tacoma, Wash.

546,749.—AMALGAMATOR—G. M. Urie, San Francisco.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

An Improved Current Water Wheel.

The accompanying illustration is that of a current wheel which is intended to be submerged and be acted upon by the current of a tidal water-course, ditch, canal or other body of flowing water. Its interior construction is such that the paddles or buckets are automatically projected when at the lower part of the circle, slots being cut through the periphery through which they pass on and out as the wheel revolves. In this way the power of the current acts only on the lower portion of the wheel. The principle of this wheel was invented by Mr. Stephen Di Vecchio of San Francisco, and the wheel, as now made, has been improved for the uses it is adapted for by some of the members of the American Power and Tide Wheel Co., which company is now the owner of the patent rights for the original invention and all improvements thereon.

CURRENT WATER WHEEL.

THE AMERICAN POWER AND TIDE WHEEL CO
(CAPITAL STOCK $900 000 90,000 SHARES AT $10 EACH

Where and how this wheel can be put to use will suggest itself to many who are interested in localities favored with water-courses, either natural or artificial, and who could make use of power generated by this means if for no other use than pumping water. In many places along the coast and on the bays where the tidal currents may be utilized, such a wheel is very valuable. The marsh lands which so extensively border the bay of San Francisco, and the rivers flowing into it, are everywhere cut by dee sloughs or creeks through which the tide ebbs and flows with a swift current. A wheel of this kind placed in a fixed position under the surface of the water so as to be submerged at all times will work with the current of both the ebb and flood tides without any attention whatever.

Even in the main bay itself, where the currents are always swift, the wheel could be utilized. It has been found by experiment that when the surface current of an ebb tide at the Golden Gate is running about five miles per hour, at a depth of 200 feet the current is about ten miles an hour. The subsurface currents are always swifter than those at the surface, though that alone to the bottom is slower than at the surface. The current at two-thirds of the total depth is generally the swiftest.

The illustration shows the wheel at work in such a place as the "Golden Gate," where it could be placed at such a distance below the surface of the water as to get the full benefit of the lower surface currents, which, as stated, are the swiftest and most powerful. Connected with pumps, it could then be made to raise water and deliver it into suitable reservoirs provided for the purpose, from which the water could be piped into the city for fire, sanitary or power purposes, or else used upon turbines and the power converted into electrical energy and the water run back into the ocean.

Placed in irrigation ditches or small running streams in the mountains, with wing dams running from the banks, it can be made to fully utilize the difference of level above and below the dam and raise water to irrigate high land very cheaply.

Its adaptation as a paddle wheel of a steamer is believed to be practical, and would be the means of saving power now wasted. As the wheel can be made with only two or three paddles projecting at one time, the raising of the water behind the wheel would be obviated by its use.

It could also be utilized in streams where mining is carried on with wing dams and Chinese pumps. It would not be necessary to raise and lower this wheel at different stages of the water. In the sloughs in the marshes it could be made to pump water to an elevated tank for power purposes or to store up electricity, as its work would be constant on both the ebb and flow of the tide. It would only be for the half hour or so at the stand of the tide when it would be inoperative.

The mechanism for operating the buckets, and throwing them into position at the proper point, and again withdrawing them, is very simple, but ingenious. There is nothing to get out of order or require special attention. A model of the wheel may be seen at the office of the American Power and Tide Wheel Company, Room 15, No. 405 Montgomery St., in this city, which will be pleased to furnish any further information concerning this wheel and the many uses to which it may be adapted. *

Scientific Progress.

Chemical Food Experiments.

The "scientific food" idea has had a check. It has been weighed in the balauce of experience and found wanting. A detachmeut of the United States army was recently detailed to try it. Fifty men were sent out for a three days' march with "scientific rations" iu their haversacks. They had little tablets of highly coucentrated esseuces of coffee and bread, which, it was imagined, would be as serviceable as the bulkier drink and food in their usual form. But at the end of the first day three-quarters of them were doubled up with cramps. Their digestive organs could not assimilate the concentrated food, or were not satisfied with it, and the experiment was a failure. It is stated that the men were ordered to keep on to the end of the three days' trial, which seems a needless hardship. Their stomachs and iutestines are uot likely to take to a diet of chemical tablets any more kindly on the second or third day than on the first.

There is something attractive in the uotion of scientific food. In many respects it would be a great gain if men could live on a few pills or powders or tablets, instead of bulky masses of bread and meat. But it is impossible. A million or so years hence it may be effected, when man has become physically as different from what he is to-day as he is to-day from the oyster, but not before. The man of to-day not merely requires a certain amouut of absolute nutriment, but he requires it to be commiugled with a certain bulk of other matter which is not nutrimeut at all. He has not only organs of assimilation, but equally elaborate and important organs of excretion, which demand to be supplied with material for their work.

Man cannot exist upon a chemical diet, for the plain reasou that he is a man. He has physical requirements and functions which demand food in other form thau chemical extracts. Much may, of course, be done by science to improve our food supply, to render it more wholesome, more efficient, perhaps more couvenient and portable. Beyoud such limits it can scarcely go. Still the new idea has adherents.

Dr. George Plumb, one of the chemists of the University of Chicago, says that the time is soon coming when hot water and food tablets will be the sole accoutrements of a kitchen. He says the essential food elements of a 1200-pound steer can be got into an ordinary pillbox. One of his tablets the size of a pea makes a large bowl of soup. A ration case of his planning, which weighed eight ounces, contained the following supply: Three tablets coucentrated soups, equal to three quarts; four tablets beef, equal to six pounds; one tablet milk, equal to one pint; two tablets wheaten grits, equal to two pounds; one tablet egg food, equal to twelve eggs.

Stars and Molecules.

In astronomy we have to do with the greatest things in nature. The sun is 90,000,000 miles distant from the earth, and of a bulk one and oue-third milliou times as great. The plauet Neptune is thirty times as far away as the sun. The nearest to us, so far as we know, of all the stars (Centauri) is well-nigh 10,000 times as distant as the planet Neptune, while beyoud it are hundreds of millions of stars farther and yet farther off. Some that can be just detected are probably 10,000 times as remote as Centauri, or, in other words, 3,000,000,000 times as far away as the earth is from the sun.

But the light that comes across those distances and reveals those far-away orbs reaches us through movements and vibrations due to molecules far smaller than any microscope can reveal. That light shakes the minute molecules of a photographic plate placed in the focus of a telescope, and leaves behiud the record of its knocks. It vibrates in the bright lines of solar and stellar spectra. In a no less wonderful way molecular knocks—most minute, but most numerous—trausmit and maintain the heat of the sun and of the stars. But, it may be asked, What are molecules and atoms? Can we affirm their existence? Can we measure their size or detect their action? Can we count them, or determiue the uumber and energy of their knocks if they are so minute?

An atom literally means that which cannot be cut. According to the atomic theory of the constitution of matter, all bodies are supposed to be made up of atoms. An atom, therefore, represents the smallest possible quantity of auy elementary body, a quantity incapable of subdivision, if, indeed, such a conception of iudivisibility is possible.

A molecule literally means a little mass, and is considered to be an aggregation of a certain number of atoms; in general, of atoms of different elements, but in some cases, it may be, of atoms of a like kind. Molecules are held to form the ultimate constituent particles of a compound body. The molecules of such a body cannot be divided if it is to retain its nature as a compound. They will, however, be resolved into coustitueut atoms, if the compound body be resolved, by some process or other, into its constituent elements. So long, for instance, as water is water, its molecules each consist of two atoms of hydrogeu joined to one of oxygen. But, if a volume of water be resolved, by heat or electricity, into two separate volumes of oxygen aud hydrogen, each molecule of the water is thereby resolved into its constituent atoms. All the atoms of oxygen go together to make up the total volume of oxygen, and all those of hydrogen to form the total volume of hydrogen, obtained from the given volume of water. So also in other similar cases.

Solid Oxygen.

Professor Dewar, the chemist, has compressed oxygen under an intense degree of cold, a degree almost beyond the power of imagination, into a pale blue fluid, a thing which, although it has been done to such an extent or in such quantity, has solidified oxygen into a jelly, has made ozone into a lapislazuli-blue fluid, and has also liquefied air. He has made the suggestion that possibly the vast shining night clouds, concerning whose composition, whether of congregated stars at immeasureable distance or of nebulous matter slowly coucentrating into stars, astronomers have arrived at no fixed conclusion, may really be only masses of carbonic acid gas frozen in the unspeakable cold of the interstellar spaces which is probably the zero of absolute temperature.

Sir Audley Coote arrived in this city last week from Sydney, N. S. W. He has had considerable to do with cable projects in the South Pacific. Regarding the recent laying of a cable from Australia to New Caledonia he discovered some hitherto unheard-of submarine peaks, hard limestone and grauite rising abrubtly from the bottom of the ocean to a height of over 7000 feet, there being less than 300 fathoms of water ou the highest peaks. This submarine range is seventy-five miles in length and occasioned the use of forty-eight miles more cable than had been calculated on, as it had to be laid around the base of these peaks in the same fashion that a railroad would be built through a mountainous country. This cable was successfully laid from Queensland to New Caledonia, a distance of 1000 miles. Sir Audley will attend the International Cable Congress in Switzerland in '96, to take part in the discussion of the proposed cable line from Monterey, in this State, to Hawaii, a distauce of 2400 miles. It is the ultimate intention to extend this Pacific cable from Hawaii to Fauning's Island, thence to Samoa, the Fiji Islands and New Caledonia, thus completing a chain of 6500 miles of submarine communication and girdling the earth.

Mechanical Progress.

One Way of Distributing Niagara's Power.

Now that the great Niagara power plant is, in part, completed and about to realize what, for years, has been the dream of engineering economists, it is interestiug to recall one of several of the pet schemes advanced in earlier days as means of utilizing the power of the falls. The modest proposition was made by an inventor who had cropped up somewhere to have a large tube laid from Chicago to New York City via Niagara Falls, and then, by turning the Niagara river into a monster turbine, compress air to about 250 pounds pressure per square inch in this tube. The latter was to be tapped at the cities along its line, and power furnished as required. As an improvement on this scheme, some mechanical genius at the time suggested that the air-compressing machinery be dispensed with as too complicated, and that the turbine be geared direct to a shaft which should be laid through the State of New York from west to east. From this shaft, power could be delivered by means of belts or gears directly to the machinery in the factories along the line of the shaft. The suggestion carried more weight of metal with it than any ever made in connection with a mechanical construction, but the idea was not more absurd than thousands to be found iu the history of the world's mechauical progress.—Cassier's Magazine.

Pipe Coverings.

A short time ago G. M. Brill, of the Solvay Process Company, Syracuse, New York, undertook a series of experiments in order to ascertain what was the best pipe covering available for use in his works. He purchased from various manufacturers samples of eleven differeut kinds of material, enough of each kiud being taken to protect sixty feet of pipe. With each sample in turn he covered a piece of pipe sixty feet in length, and subjected it to a thorough scrutiny, observing particularly the amount of condensation effected iu each case. The follow table shows the pounds of steam condensed per hour per square foot of pipe, and the cost of sixty feet of covering applied to the pipe:

Nature of Covering.	*Steam Condensed Per Foot Per Hour. Pound.*	*Cost of 60 Feet of Covering.*
Bare pipe	0.8458	.....
Magnesia	0.1200	$33.87
Rock wool	0.0802	29.62
Mineral wool	0.0890	23.34
Fire felt	0.1570	31.80
Manville sectional	0.1093	32.56
Manville sectional and hair felt	0.0662	40.56
Manville wool cement	0.1078	42.56
Champion mineral wool	0.0990	18.87
Hair felt	0.1309	13.50
Riley cement	0.2979	28.71
Fossil meal	0.2747	34.20

—American Manufacturer.

An ingenious Australian has invented and introduced a mica cartridge for sporting and military guns. The filling inside the cartridge is visible, and a further advantage is that instead of the usual wad of felt a mica wad is used. This substance, being a nonconductor, unaffected by acids or fumes, acts as a lubricant. Where smokeless powders, such as cordite aud other nitro-glycerine compounds, are used, mica has a distinct advantage over every other material used in cartridge manufacture. Being transparent, any chemical change iu the explosive can be at once detected. The peculiar property it has of withstanding intense heat is here utilized, the breech and barrel being kept constantly cool. The fouling of the rifle is also avoided, the wad cleaning the barrel.

In putting together quartered pine, or any other kind of wood, greater strength and durability can be obtained by placing the grain of the wood at an angle of 60 degrees than can be obtained by crossing at 90 degrees. As all wood expands and contracts more or less under the variations of moisture in the atmosphere, the pieces glued at an angle of 60 degrees can expand and contract to a certain extent without tearing themselves apart, as in the case when glued at an angle of 90 degrees. The 60 degrees glue joint simply pulls the joint out of place a little, and disturbs its shape, while the 90 degrees glue joint pulls things to pieces in its effort to accommodate itself to climatic conditious.

M. Blondel of France has devised a successful method of welding lead. The surfaces to be welded are carefully cleaned, and then a layer of lead amalgam, composed of lead and quicksilver, is placed between. An ordinary soldering iron is then passed over the edges, the mercury is vaporized, and the finely divided lead fuses and unites the surfaces in a perfect weld.

Electrical Progress.

Reverberatory Electric Furnaces.

By H. Moisson.

The reverberatory electric furnace with movable electrodes which we built in 1892, and successfully improved since that time, is of great simplicity. By means of this apparatus we have been able, thanks to a sufficieutly high temperature, to reproduce diamonds, to effect crystallization of the metallic oxides, the reduction of oxides heretofore deemed irreducible, the fusion of refractory metals, the distillation of lime, silicon, zirconium aud of carbon, and finally the abundant evaporization of metals, such as platinum, copper, gold, iron, manganese, aluminum and uranium. The operation of our apparatus is of the most simple character. The current is carried by two flexible cables to the carbon electrodes. The contact is established, the arc starts, and, by withdrawing the electrodes more or less, this powerful spark is given a constant length which depends on the power of the current, and on the conductivity of the metallic vapors which fill the furnace.

From the beginning of the experiment a penetrating odor of hydrocyanic acid is produced, brought about by the combination of the nitrogen in the furnace, with the acetylene which is formed at the beginning. This is an energetic reproduction of the beautiful synthesis of hydrocyanic acid obtained by M. Berthelot. A purple cyanogen flame first illuminates the arc; then this color disappears aud the color becomes white. The lime which forms the interior of the furnace soon begins to melt and to run like wax, and then to boil, and in a few minutes the electrodes are brought to a red heat, a torrent of vapor issuing from all sides with a constantly increasing intensity. The lime distills in abundance and covers the supports of the electrodes with a white film. Thus, when utilizing the current of a machine of from 100 to 300 H. P., we have in the middle of the furnace an enormous temperature, produced by the electric arc; a few centimeters below, the crucible which encloses the matter experimented on; and below this, a wall of lime in full ebullition. The bad conductivity of this lime is a fortunate thing for us. It confines in the smallest possible cavity the maximum heat which an electric arc can give us.

This new apparatus, which we have modified according to the requirements of experience, has permitted us to undertake the study of a whole series of simple bodies which heretofore were only laboratory curiosities, for the lack of sufficient means to obtain them. Among the substances is chromium, which has never heretofore been obtained in any large quantities. In order to obtain chrome steel it was necessary to prepare in a cupola an alloy of iron and chrome very rich in carbon, and known as ferro chrome. With an electric furnace an abundance of cast chrome is obtained by reducing sesquioxide by means of carbon. This cast product, when refined, gives us the chromium, and this inoxidizable metal is very different from that heretofore obtained. It takes a finish like iron, and a very beautiful polish. In

one experiment forty-four pounds of chromium were obtained at one casting. Molybdenum can also be obtained in the same way in large quantities. Combined with steel it takes a temper and can be forged under the anvil at red heat.

Tungsten was a substance formerly known to chemists only in a state of powder; its preparation in the electric furnace will become very simple. Under the action of the arc the oxide of tungsten will be reduced by the carbon and will give us in a few minutes a pure metallic mass, covered with a beautiful layer of blue oxide of tungsten. The tungsten does not seem to have a great affinity for carbon, and can therefore be produced in a very pure state.

By submitting a mixture of sesquioxide of uranium and carbon to the electric heat reduction is made in a few minutes and produces a metal having a brilliant fracture and an extreme hardness, and with a slight admixture of carbon presents the curious property of igniting on contact with silica. All these simple metallic bodies melt at the very highest temperatures; beside them we placed other metals, whose minerals are very rare, such as zirconium and vanadium.

During these long researches we have had occasion to handle currents of greatly varying strengths. Beginning with small machines of 4 H. P. they have been gradually increased up to machines of 100 to 300 H. P., situated in the station of the Edison Co. These studies have led us to the conclusion that the heating power of the electric arc certainly increases with the intensity of the current. M. Rosetti looked upon the electric arc as possessing a constant temperature, independent of the current, and he attributed to this arc the excessive temperature of 4800°, and at the positive electrode with the current furnished by 120 Bunsen elements a temperature of about 4000°, although physicists have not yet measured this in a reliable manner. With the enormous heat giveu out by the arc we are very certain that we are very far from the 2000° which we obtained formerly in the laboratory.

By means of a machine of 300 H. P. titanium has also been prepared in large quantities, the properties of which are entirely different from those formerly attributed to the gray powder bearing that name. This body takes fire in fluorine, it does not decompose water except at red heat, and possesses the curious property of burning in nitrogen at high temperature, furnishing the nitrate of titanium. It combines easily with carbon and silicon, but not with argon.

I am convinced that the working of metals by means of the heat of the electric arc will be developed to a very high degree. One will thus avoid adding to the mineral all the impurities of the coal, the gangues and the fluxes will disappear, and finally one will bring to the desired temperature the mixture to be put iuto reaction. As an example we may mention the production of carbide of calcium, which by contact with water disengages acetylene, for the production of which works are being erected in America, England and Germany.

Earth Currents and the Earth Dynamo.

By JAMES S. LANG.

With the advent of modern electrical transmission, there has come to inventors and scientists iu general a partial realization at least of the tremendous waste of energy continually going on around us. Those more sanguine and less practical would harness the tides which roll against our coasts and compel the moon herself as she swings along in her path, a corpse among worlds, to drive our factories and light our streets.

And yet such visions are not wholly illusions, but are capable of being developed to a certain degree, by careful study of the conditions, with proper discrimination between the practical and the impractical.

One class of phenomena worthy of more attention than it has received is that relating to earth currents. This is not to be wondered at, as investigation flows in well-defined streams, and the attention of investigators has been turned to subjects of more immediate pecuniary value.

The theory of their cause which I present here, and which is a result of the action of what I designate as the earth dynamo, appears to be borne out by the facts and phenomena observed.

It has been known for many years that there was an intimate connection between the sun spots, the magnetic needle and earth currents. This connection is so well marked, and its action is so certain, that it would indicate conclusively that magnetic polarity is possessed to an intense degree by the sun. That the magnetic poles of the sun coincide very nearly with its geographical poles is shown by the fact that, in the absence of spots, no changes in the terrestrial magnetic state occur which have a periodicity equal to the time of solar rotation. The suu, then, we are forced to conclude, may be considered as a magnet, in the same way that we look upon the earth as one, and as such possesses its liues of force, which, after having passed from pole to pole inside the sun, envelop and pass the earth at a distance of 91,000,000 miles on their return course. Far beyond our farthest planet these lines spread out in gigantic ellipses, bringing planet and asteroid alike into magnetic touch with the seething monitor of our solar system. And our planetary system is again and again permeated with weaker lines of force having their origin in other suns than ours, and our sun himself, as he whirls ceaselessly onward, feels with his magnetic uerves the influence of the sideral system of which he is a single atom. The milky way stretching across our sky points to our minds the direction of the lines of force which have hurled together suns, stars and systems. Multiply the range of our telescopes by infiuity and you would see other gelastic belts, around, beyond and parallel to our owu, stretching away into endless space—indices of lines of force—the handiwork of an infinite Creator, the harmony of whose productions exceeds our wildest flights of imagination.

Thus we see that one factor of the magnetism of the earth is due to the lines of force passing through the sun, which penetrate the earth on account of superior permeability.

That the magnetic poles of the earth are not stationary is shown by the constant diurnal variation of the magnetic needle. Their virtual traces on the earth's surface revolve in small circles around the traces of the main pole, and the angle between the two tangents to these circles drawu to a magnetic needle gives the amplitude of diurnal variation of that needle under normal circumstances.

It is plain that if a wire be suitably placed on the surface of the earth, it cuts this revolving component of the earth's magnetism and we have earth currents as a result. We may consider the earth as a typical spherical armature, familiar to all, in the conductors of which, at times when the equatorial component grows large, we have high voltages.

We see, then, that earth currents may be due to the revolution of this earth armature in a magnetic field of which the sun is the immediate inducer. We are, then, led farther: Why not wrap our earth with a suitable system of conductors and wrest from our Mother Earth an amount of power equal to that wasting at every tide on every sea?

It is easy to determine its feasibility, for we know that the iutensity of the revolving equatorial component is equal to the side of half the angle of the diurnal variation of the compass times the intensity of the earth's magnetism. A difference of potential of oue volt being produced in every conductor which cuts 100,000,000 lines of force per second, if we surround the earth with a coil of 100 wires, it may easily be shown that a difference of potential of upwards of 60,000 volts would be produced under normal conditions.

For wires extending both above and below the equator with turns connected in series, the following methods of application will apply: Selecting such a position on the earth's surface that data applicable to that place will be approximately a mean for the whole surface, we may say that the actual intensity of the earth's magnetism is equal to the horizontal component times the secant of the augle of inclination of the dipping needle.

Taking horizontal component equal to .20 of a line per square centimeter and inclination equal to 60°, we have for the intensity of the earth's magnetism .40 of a line per square centimeter.

The revolving equatorial compouent of this will be equal to .40 times sine 7 feet, when diurnal variation is 14 feet, which equals .0008144 of a line per square centimeter. The area swept over by a single wire placed as designated will be $2\times48,875,360,000$ square feet, or $2\times44,940,709,440,000$ square centimeters.

Therefore the voltage induced will be

$$\frac{44\ 940,709,440,000\times2\times.0008144}{100,000,000}$$

which equals 742. This multiplied by 100, the number of turus of wire used, equals 74,200 volts.

If the difference of potential was 60,000 volts in round numbers, and No. 0000 wire used, one-eleventh of an ampere would flow, and the total power produced would be 5454 watts, or less than 8 H. P. Although the amount would rise into hundreds of H. P. at those times when earth curreuts become abnormal, the enormous cost of the plant would forbid its practical application.

PROF. GEORGE FORBES, who has brought the Niagara electric plant to a successful completion, says: "The directors have no present desire to send the current to great distances. It will pay better to create a smokeless manufacturing town in the neighborhood."

Practical Information.

Red Lead for Iron Work.

Red lead has density, weight, body. To get the heavy pigment thoroughly incorporated with the lighter raw liuseed oil put in considerable red lead and comparatively little oil. By so doing the particles of red lead will not settle out of the vehicle either in the pot or on the surface, greater covering will be had than in a thin mixture, rapid drying will ensue, the use of japans will be obviated, and the maximum durability obtained. That chemical union of red lead with linseed oil which gives red lead paint its superiority is most completely effected when raw oil only is employed. Should, however, a thinner mixture be wanted, to sustain more completely the heavy particles of red lead, the introduction of a small quantity of japan, say one-half pint to a gallon of paint made with raw linseed oil, or the substitution of boiled oil for the raw oil is desirable to prevent running. The latter practice is that of a number of railroads, probably with a view to economy in the use of red lead. The saving in pigment, however, would most likely be more than offset in the settling of the red lead from the oil if much less than twenty pounds are employed to the gallon of paint, even with the use of japan. Where raw oil only is employed a few pounds more of red lead may be necessary, dependent on the atmosphere and temperature. Where weighing the oil is impracticable, through lack of time or facilities, we would recommend a given weight of red lead to each gallon of oil as being more convenient. Thus the specificatious of the Cincinnati Southern Railroad, on which red lead has been used with eminently satisfactory results, reads: "Not less than 37½ pounds of pure red lead to each gallon of pure boiled linseed oil."

The superintendent of a large bridge company which uses red lead as a standard says their formula is 30 pounds of red lead to a gallou of raw linseed oil. Good results will no doubt be had anywhere between the figures given, in some cases with 25 pounds of red lead to the gallon of raw linseed oil, or occasionally even a few pounds less. There can be no absolute, unvaryiug formula for mixing. Temperature, moisture, experience and skill of the painter are all factors.

The use of lamp black introduces a new element into the mixing of red lead paint. Lamp black requiring considerable more oil than red lead, more oil should be used aud less red lead can be used in a mixture of red lead, lamp black and liuseed oil than in one of red lead and linseed oil alone. As the lamp black also retards the natural drying properties of red lead, a small quantity of japan might be recommended not so much to cause drying as a binder for materials of such diverse specific gravity.—Scientific Machinist.

A MAN may measure the width of a river or of any other stream by means of the brim of his hat, provided the ground on his side of the stream extends back level for some distance. The man stands facing the river and pulls down his hat brim until the edge of it is on an exact line with the edge of the bank on the opposite side of the stream. Then, putting his hand under his chin to steady it, so as to keep his head in the same position, he turns slowly around and notes where the edge of his hat brim cuts the ground on his own side of the river. The measure of the distance on the level ground will be the width of the river.

THE human frame is a magnet. A man will carry a watch for years and be proud of its accuracy. Then he will fall ill, the watch will lie on the mantelpiece or on the chest of drawers and will develop great inaccuracy and unreliability. The only explanation given is that the absence of magnetism upsets the time announcer, and the best proof of this is that when the man recovers and takes his watch it soon gets right again. No two men appear to have the same magnetism in their frames, and it is seldom that two can use the same watch satisfactorily.

1000 FEET FOR $1000.

This can be done with the

CHAMPION DIAMOND CORE DRILL

That we own and desire to sell, having completed prospecting our mine. The plant is complete in every detail, including every tool and diamonds, and is practically new. The 1¼-inch core can be taken out 1000 feet in depth at any angle at the rate of 30 to 50 feet a day. Why sink shafts, drive drifts and fight water to know your mine?

S. V. RYLAND,
Gold Hill Mine. .....Angeles Camp, Cal.

Hydraulic Mine for Sale.

Not on a navigable stream; in northern California. Good dump; no trouble with tailings; 180 acres of mining ground; 5000 inches of water. Can work eight months in the year. Ample opportunity given a buyer to fully test the property before payment is made. For further details,

Address X, 2022 W St., Sacramento, Cal.

FRANK L. BROWN, PACIFIC COAST AGENT.

About 5000 square feet of surface on top of the monitor of the roof of the new forge shop of the Berliu Iron Bridge Compauy at East Berlin, Conn., consists of an impervious material called translucent fabric, which transmits the light quite well, although giving it a decided yellow tinge. The material consists of a wire cloth, having a mesh of about an eighth of an inch, covered with a product of linseed oil which resembles a flexible gelatine, and is made by a secret process. The roof at East Berlin has sustained three severe rainstorms without leaking, cracking or changing its shape. The material is said to remain unignited when exposed to a temperature of 800° Fahrenheit, and it has been in use without injury on a foundry skylight inclined at an angle of 45°, within tweuty feet of a chimuey blowing out sparks and small pieces of molten metal. The fabric weighs from a seventh to a tenth as much as ordinary skylight glass, and is claimed to be particularly suited for skylights of factories and shops, particularly those having iron roofs. It was not very long ago that it was aunounced that glass plates containing wire were being made for covering large passenger train sheds and for other places where it was necessary to secure plenty of light and at the same time be sure that there was no chance of accidents from broken glass. The translucent fabric appears to differ from the wire glass in being much stronger, a poorer conductor of heat and by no means transparent.

Professor Runnebaum, of Berlin, sent by the German government to examine the timber resources of our Pacific coast, expresses amazement at the waste he witnessed here. He says the end of American forests is near at hand unless they are protected by law against reckless cutting and conflagrations. While the leading countries of Europe are trying to make trees grow, the Americans are sweeping away not only the mature trees but the saplings, which are the rightful heritage of future generations. "If nothing is done by your Government," in his opinion, "you may live to see lumber shipped from Germany to Puget sound." When the professor was in Oregou and Washington the whole coast was darkened with smoke from fires devouring enormous tracts of timber unsurpassed iu the world. His remark that the life of the forests is the life of the people is no flourish of rhetoric. It is a verified law of nature, but trifled with or ignored as yet in America.—New Orleans Picayune.

One of the immense guns for the Uuited States battleship Oregon has arrived at the Union Works on a special car constructed for the purpose by the Pennsylvania Railroad. The car is similar in construction to the one used for transporting the Krupp gun to Chicago during the World's Fair. The car will be returned immediately for the purpose of transporting the other three guns of the same size. The gun is a thirteen-inch rifled piece, weighs 157,500 pounds and is 40 feet in length. The car is so constructed as to distribute this weight as evenly as possible over the numerous wheels of the trucks. It is expected that all the guns will be in place upon the Oregon before wiuter.

All indications agree that less than ten miles below us a red heat is attained, and within twenty a white heat. Ten miles below us it is red hot. Ten miles above us we have the pitiless cold, far below zero, of interplanetary space. To what a narrow zoue of delicately balanced temperature is life confined!

Hoskins' Patent Hydro-Carbon Blow-Pipe and Assay Furnaces.

No dust. No ashes. Cheap, effective, economical, portable and automatic.

OLDEST AND LARGEST HOUSE ON THE PACIFIC COAST.—Established in 1852.
Manufacturers and Importers of
ASSAYERS', MINE AND MILL SUPPLIES,
Chemicals and Chemical Apparatus.
Sole Agents for the Pacific Coast for the W. S. TYLER WIRE WORKS CO., manufacturers of
Steel and Brass Wire Battery Screens.
We have on hand the following second-hand assay balances: they have been carefully readjusted and are practically as good as new:
One No. 12 Oertlings Balance for.....$100 00
One No. 2 Froemner Balance for..... 50 00
Two No. 16 Becker Pulp Balance, each 15 00
Send for Catalogue and Assay Table.

The Briggs
TWO-STAMP MILL,

850-lb. stamps; weight of mill, 6000 lbs.
The most substantial mill ever offered to miners; discharges both ends and front; will crush from 6 to 10 tons per day; any one can set it up.
Complete as per cut, price $450.00. This mill is furnished with 9-inch cast steel shoes and dies, and substantial independent iron guides.
Western Manufacturing Company,
114 and 116 Mission St., San Francisco,
Builders of all kinds of Saw Mill and Mining Machinery, Engines, Boilers and Special Machinery.

HEALD'S
Business College,
24 Post Street, - San Francisco.
FOR SEVENTY-FIVE DOLLARS
This College instructs in Shorthand, Type-Writing Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils.
A Department of Electrical Engineering
Has been established under a thoroughly qualified instructor. The course is thoroughly practical. Send for Circular. C. S. HALEY, Sec.

PATENTED.....No. 507,400.
BOYD'S
Compression Grease Cup.
The Only Cup in the Market that will give Perfect Satisfaction.

We call special attention to the Strength of the Cup, together with the High Top, which permits the use of a powerful spring that works throughout its full extension, thus ensuring the feeding of the entire contents of the Cup. Also to the Automatic Air Valve, which breaks the vacuum underneath the plunger and thus enables the Cup to be opened at any stage of the feeding without exertion or sucking back the grease or compound from the bearing. This is the only effective device for this purpose ever applied to a Cup. These cups are manufactured in several designs and sizes, suitable for various purposes. For Journals the screw top lever is ordinarily used, and can be furnished with Spring pressure or with Screw pressure without a spring; both forms, however, have the Automatic Air Valve. For loose pulleys a specially fastened hinge Cup with Automatic Air Valve is made, as shown in the cut.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

A REVOLUTION IN ORE PULVERIZING.

THE

Merralls Hydraulic Quartz Mill,

The Greatest Ore and Rock Pulverizer in the World, Either Wet or Dry.

THE ONLY MILL BUILT THAT RIVALS STAMPS. Our six-foot mill (No. 1) will reduce more ore or rock to pulp than a ten-stamp mill, with less than one-half the power and less than one-half the wear and tear, besides saving a much larger per cent of the gold in the ore.

This mill will reduce from 25 to 500 per cent more ore than any other rotary mill in use. Cheap, simple and economical. Four sizes built—from 15 to 250 tons capacity.

Send for Circular. Address

MERRALLS MILL COMPANY,

Room 12 Third Floor, Mills Building..... San Francisco, Cal.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 3, 1895.

The advance in copper is not a "boom," but a case of supply and demand. It now looks as if both demand and supply would be something tremendous. So far in '95 the total output of the copper mines of the United States has been 25,000,000 pounds less than home consumption and exports. During the year ending June 30, '95, copper exports were 60,000,000 pounds less than for the preceding twelve months. Every copper prospect on the continent is getting attention, and the output for '95-'96 will be enormous. Yet that copper will advance beyond 12½ seems certain.

Silver has lifted itself from 59½ six months ago to 67, around which point it oscillates. That it is able to regain and retain even that figure is satisfactory.

The *Iron Age* says the situation "in the steel market is puzzling. It has been difficult to understand where all the product turned out goes to in the absence of a good railroad demand, and yet the larger interests are scrambling for the raw material. It can only be explained by assuming that important developments in steel rails are pending."

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from E. C. Hard, in the Terry Hill Mine, near Spanish Ranch, Plumas Co., to impound tailings in an old pit; from Will De Viney, in the Lone Star Placer Mine, Cromberg, Plumas Co., to impound tailings in Jackson Creek; from Charles Jordan, in the Poor Man's Hydraulic Mine, near Placerville, El Dorado Co., to impound tailings in Taylor's Ravine; and from L. Canato and G. Oneto, in the Eagle Mining Claim, on Dry Creek, Amador Co., to impound tailings below the mine, gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Oct. 14, 1895, at 1:30 P. M.

Mining Share Market.

SAN FRANCISCO, October 3, 1895.

The general markets shaded off on Friday and Saturday of last week, opening weak on Monday, but recovered somewhat on slight advance in Potosi and Cbollar. The improvement was short lived, for under a strong selling of the Gold Hill shares there was a rapid decline along the entire line. The setback was precipitated by the levying of an assessment and reports circulated of others to follow, supplemented by an impression tbat the deal was over. Tbe weakening caused brokers to call for more margin, whicb brought about a large selling on Wednesday morning. This selling sent prices down from tbe highest figures touched on the preceding day about 20 per cent in the Gold Hill shares and from 10 to 15 per cent in the middle and north end shares. Owing to the recovery which set in after the sharp decline not having been rapid, the prevailing opinion is still bearish. Notwithstanding the somber looks of the market we still adhere to the opinion expressed in last week's issue that the market will do considerably better before long, yet this opinion does not warrant outsiders who cannot pay cash, overbuying. It is always a safe proposition to be prepared for the unexpected when dealing in mining shares. So far as outside indications go, there is nothing to warrant the belief that there is a money syndicate in tbe market, and until this is shown it would seem the part of wisdom to take the bird in hand and let some one else try and get the two birds in tbe bush. The activity shown by Potosi and Chollar would indicate that the small pools said to be manipulating tbe market have concluded to take them in for manipulating with those given in our last issue. If this view is correct, then the three groups will show more life on the next upward move. The shares in the Alta group were weak and inactive. Botb Alpha and Occidental broke badly under a 10-cent assessment. In the Bodies prices weakened off with Bodie selling freely under 30 cents a share. A report is current that Con. Virginia is to be assessed, but it is hardly likely that this will be done before some time in next month; but it is reported that otber assessments are to be levied sooner.

From the Comstock mines the news is of the most favorable character. This news is reported in official letters, yet it is not of so pronounced a character as that wbicb comes to hand tbrough private channels. In the Alta group tbe work done bears close watching, still it may be sometime before results can be known. In the Gold Hill group work bas been suspended in Belcher and Seg. Belcher. Overman is milling 200 tons of ore, assaying about $50 to the ton. Crown Point is still working to the west. The Kentuck winze improves as it goes down. Before ten days pass Confidence's west drift from the surface tunnel ought to strike the downward continuation of the ore found eighty feet above. Yellow Jacket continues to push some important work. Con. Imperial is still running the drift for tbe west lode, but slow progress is being made. Tbe same remarks apply to Alpha. In the middle group there is an improvement in Potosi, but more work has to be done before its extent and value can be found out. Hale & Norcross will reduce the accumulated ore which ought to net the company over $10,000 in coin, while Savage is still pushing important work and extracting ore. In the north-end group the work in Con. Virginia points to more time, as does that in Gould & Curry and Best & Belcher. An improvement is reported in Ophir, wbich has a favorable bearing on Mexican. The work being done is on both the upper and lower levels. Still better results are looked for soon. In Union and Sierra Nevada the work under way is being closely watched, yet it may take more time than is now expected before results can be known. In Andes tbe work under way is of an exploiting character. West Con. Virginia's contract for tbe use of the Con. Virginia's old shaft having expired, there are some doubts about their getting a renewal. It is stated that in the event of its not being secured, work will be resumed on the upper levels, owing to the west drift run on the 1100-foot level having drained the mine.

From the Bodie district the news is unimportant. The work under way is both dead work and exploiting. Work on the Brunswick lode is being pushed ahead. It is stated that exploiting drifts will be started soon, but what will be found it is hard to say. Still there are many miners who are very sanguine as to the outcome.

The lowest and highest prices paid on regular call from Sept. 26 to Oct. 2, inclusive, were as follows:

Miners, Attention!

OUR works at Shell Mound are now ready to demonstrate to owners of mining properties (in carload lots or less) the quick and cheap reduction of refractory ores, by the "Holland Patent Blow Pipe Furnace." Refractory gold and silver ores are made free milling. The furnace is constructed to save all volatiles, no values allowed to escape. Complete plants in sizes to handle 10 tons per day up, built at reasonable cost, in comparison to all other methods. We would be pleased to have you call or write.

NOTICE OF ASSESSMENT.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the first (1st) day of October, 1895, an assessment (No. 20) of Ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fourth (4th) day of November, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the twenty-fifth (25th) day of November, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

ANCHOR COAL AND DEVELOPMENT COMPANY.

NOTICE OF ANNUAL MEETING.

The annual meeting of the shareholders of the Anchor Coal and Development Company will be held at the office of the Company, No. 632 Market Street, Room 5, San Francisco, California, on MONDAY, the 21st day of October, 1895, at 11 o'clock A. M., for the purpose of electing a Board of Directors for the ensuing year and the transaction of such other business as may come before the meeting. E. D. FARISH, Secretary.

OFFICE.

The shareholders of the Anchor Coal and Development Company will please take notice that the office of the said Company has been removed from 19 Montgomery Street to 632 Market Street, Room 5, as per resolution of the Board of Directors.

FOR SALE!

120 Acres in San Diego County,

With one ledge 4 feet quartz and two cross ledges 2 feet; extensions of well known mines. Inquire 1523 Stockton St., San Francisco.

WANTED.—POSITION AS ASSAYER OR Amalgamator. Capable to take charge of mine and mill. Over 25 years experience. C. S. A., 1212 So. O Street, Tacoma, Wash.

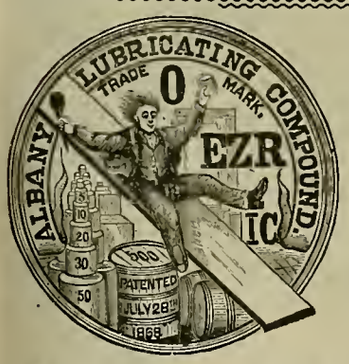
The Improved, Iron-Frame, Self-Contained, Cushion - Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.



THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

Send for Catalogue and Price List.

SAVE MONEY BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE

FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1900 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8½ gallons @ 14c	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

THE BLASDEL IMPROVED ORE CONCENTRATING BELT.

We are now having our belts made by the best rubber manufacturers in New York and Boston, under written guarantees both as to quality and mechanical construction.

We have been granted two United States patents for improved devices in concentrating belts, the first and most important of which is for a slight riffling of the surface at intervals and crosswise of the face of the belt.

While these riffles are only about one-thirty-second of an inch in depth, they are very effective in saving floured sulphurets and reclaiming quicksilver and amalgam that may escape from the plates, thus gaining a large percentage of values that would go off with the tailings from belts with entirely smooth surfaces.

Our second patent is for an improvement in the flanges which practical mill men will appreciate. They stand at an acute angle inwardly, therefore they thoroughly confine the pulp on the belt; and in passing over the end pulleys of the machine, lie partly down, consequently do not crack or break, as do the old-style flanges; thereby much vexation and loss is avoided. *We keep in San Francisco and New York belts of all lengths and widths suitable for all concentrators in general use.*

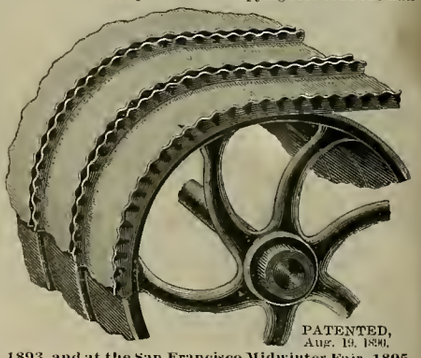
KNIGHT WATER WHEELS—Highest Efficiency Guaranteed.



MINING, MILLING, PUMPING and HOISTING PLANTS.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891, MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.

PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

Merced G. M. Co.'s Hoisting Engine.

Herewith is illustrated the latest design of first motion hoisting engine, as designed by the Risdon Iron Works for the Merced Gold Mining Company, and now being erected on the Nelson shaft at Coulterville, Mariposa county. This hoist is a model of its kind and is claimed to be the most complete yet built in this country. It is designed for a depth of 2000 feet, at an average speed of 1750 feet per minute and a maximum speed of 3000 feet per minute. The engines are equipped with Risdon Corliss valve gear, and are directly connected to the reel shaft. The engine bearings are all adjustable and of massive construction.

The auxiliary engines are five in number—two for the reel brakes, one to operate the reversing gear, and one for each clutch. All are of the Cataract cylinder type, the upper cylinder being filled with oil, and having an adjusting valve to regulate the speed with which they operate, which can be done with a nicety. The engine is handled from an elevated platform, giving the engineer full view of the collar of shaft, also all parts of his engine. The cylinders are equipped with automatic relief valves and hand reliefs, which act as a cylinder brake when lowering with one cage. The reel brakes are of a new design, embodying all the latest improvements. The crank discs are equipped with band brakes operated by foot. The entire construction has received the greatest care and attention, and it is believed by the builders that nothing superior in hoists can be found on any mine in this country.

The Risdon Iron Works build this style in all sizes; the facilities of this concern being fully up to all requirements. They built the great Alaska-Treadwell mill of 240 stamps, which is the largest in the world, and is reducing ore at lower cost than any other that has furnished statistics on that point. The Merced Company show the proper spirit in placing such reliable machinery on their mine.

The Mining and Scientific Press welcomes the representatives of the various county mining associations who have been delegated to attend the annual convention of the State Association next Monday, and hopes that their deliberations will result in benefit to the mining industry of the State. The character of the men chosen shows that good judgment was displayed in their selection. There is considerable work to be done in this convention for the mutual interests of the miners, and much depends upon determined, united and harmonious action. To further the work of rehabilitation of the hydraulic mining industry, to secure appropriate legislation for the quartz and drift miner, and to preserve the mineral area of the State from corporate absorption are among the most pressing present demands. The standing committees' faithful work and reports deserve affirmation,

The California Miners' Association and Matters Connected Therewith.

On the eve of the Miners' Annual Convention a synopsis of the history of the associatiou, its work, the results, ensuing legislation, and the action of its committees may be of interest to many. A great deal has beeu done; a great deal remains to do, and with united and harmonious action on the part of the delegates who meet next Monday the success of the past three or four years can be continued. The following is not written in any remiuiscent spirit, but solely to refresh the minds of many as to what has been done, the great scope of the subject and the need of energetic and united effort to aid in the further development of the only present paying industry in this State.

The first of this series of conventions of the California Miners' Association was held at Pioneer Hall in this city ou January 20, 1892. J. H. Neff of Placer was chairman and W. C. Ralston of San Francisco, secretary. The object of the convention was to ask Congress to pass laws permitting the resumption of hydraulic mining in this State. A memorial to Congress was adopted setting forth existing facts and asking for relief. On October 1, '88, Congress had passed "an act for the investigation of the mining debris question in the State of California," a board of engineer officers had been appointed in accordance therewith, they had made a report, and Congress in this memorial was asked to accept and act upon its conclusions. The memorial asked Congress to make sufficient appropriations for the erection of suitable works for the restraining of mining debris, and that mining laws be amended and department rulings be modified, to the end that existing unnecessary burdens be removed from the miners of the State. There were present representative men from the foothills and valleys, and a harmonious and united spirit prevailed. The interests of all were recognized and provided for and on the third day of the convention a constitution and by-laws were drafted and the California Miners' Association was organized. Permanent officers were appointed, committees constituted, aud a general feeling was manifest that all pull together. After adjourument a committee from the association met a similar committee from the river improvement convention at Sacramento, where further conference resulted in fully harmonizing the interests of the miners and valley residents. A delegation was at once sent to Washington, which worked in unison with a similar delegation from the river improvement convention; permanent branches of the State Miners' Association were organized in the priucipal mining counties and money was freely forthcoming for necessary expenses. On February 1st, '92, Congressman Caminetti introduced two bills into Congress, one asking the Secretary of War to submit for the consideration of Congress estimates of the amounts of money which could profitably be expeuded in making the improvements recommended by the commission of engineers to restrain debris and prevent its lodgment in navigable rivers; the other to create a department of mines and mining. During that month three bills were introduced by Congressmen Geary, Caminetti and Felton, relating to mining debris, Caminetti's bill containing the principal features of the other two, and providing for the creation of a California Debris Commission, defining its duties and appropriating sufficient money to euable it to maintain official existence. The bill also provided for the erection of suitable restraining dams at various localities, and appropriated $1,670,000 for their construction. The following month the Committee on Mines aud Mining reported on the bill, favoring the creation of a debris commission, appropriating $50,000 for its expenses, and an appropriation of $450,000 for construction of restraining dams. The bill creating a department of mines and mining was also favorably reported ou by the House committee. On the 28th of May an anti-mining meeting was held at Colusa by farmers and citizens, at which resolutions were adopted protesting against the passage by Congress of the hydraulic mining bill, and an anti-debris convention called to meet at Sacramento, June 10, to make further effort to defeat the Caminetti bill. The Executive Committee of California Miners' Association passed resolntions deprecating such action and appointed a conference committee to attend the Sacramento meeting. The committee of conference were almost refused admission, but after a long debate the convention decided to admit the committee, when it was found that the committee had grown tired of waiting and had gone home. The convention disagreed with the opiuions of the Government engineers as set forth iu their report, and in a set of sweeping resolutions denounced the Caminetti bill and all connected therewith. After considerable delay and opposition the Caminetti bill passed the House, July 18th, by a vote of 143 to 43. As passed it was considerably amended; it was decided that the Government build no debris dams, that being left to the miners themselves, under regulations of a debris commission composed of U. S. Government engineers. The only direct appropriation was one of $15,000 for the commission's expenses. The bill was not satisfactory, but was the best that could be done, being largely in the naturc of a compromise. Congress adjourned before the bill had got out of the hands of the Senate Committee, so that the whole thing went over to the next session. On August 6th representatives from Sutter, Butte, Yolo, Solano, Colusa, Glenn, Tehama and Sacramento counties met at Sacramento and formed a new Anti-Debris Association. Their next meeting was at Marysville on September 22.

The second convention—the First Annual Convention—of the State Miners' Association met in Pioneer Hall, this city, November 15th, '92. The valley delegates had beeu cordially invited, but did not attend. The secretary reported the membership of the association 4378. The financial statement showed receipts as follows:

San Francisco county	$ 7,405 33
Nevada county	2,450 00
Placer county	2,002 00
El Dorado county	450 00
Trinity county	250 00
Shasta county	200 00
Plumas county	232 50
Yuba county	555 00
Sierra county	700 00
Amador county	82 50
Butte county	200 00
Total	$14,522 33

The expenditures were:

Office rent account	$ 376 10
Salary account, office sundries	1,080 67
Stationery, stamps, etc.	228 28
Office fixtures	284 30
Printing certificates, typewriting	331 37
Miscellaneous expenses	557 30
Expenses of delegation to Congress—	
J. K. Luttrell	3,888 80
J. B. Hobson	3,207 40
Niles Searles	2,535 40
R. McMurray	1,000 00
Miscellaneous expenses, telegrams, etc.	697 67
Total	$11,329 27

The resumption of hydraulic mining was fully discussed; a strong memorial was prepared to be presented to Congress, calling attention to the difficulties of obtaining patent to drift-mining ground under the rulings of the Land Office and Interior Department, and, as in the January convention, the efforts of the railroad companies to absorb the mineral area of the State was clearly commented on. The fact that the railway corporations were trying to get title to public lands which really belonged to the domain of the prospector was brought out, but it was decided best "not to antagonize the railroad influence," and the association contented itself in this regard with adopting the following:

It is respectfully suggested that to meet this difficulty Congress might take the necessary steps to determine definitely what shall he regarded as mineral and non-mineral land.

Resolved, That the interest of the gold-mining industry of California requires that Congress should pass an act the force and effect of which shall be that all lands which have ever been returned hy the United States Surveyor-General as mineral in character, or lands within the well-recognized mineral helt, shall he presumed so to he before the Land Department until the contrary is clearly shown; and that the chairman of this convention be requested to appoint a committee of five to draft such legislation as will reach the wishes of the miners of California upon this subject, report the same to the executive committee of this association for their adoption, and that the same he transmitted to our Senators and Representatives in Congress.

The Caminetti bill was discussed at great length. No one present was wholly satisfied with it, and several opposed it in the sincere hope of getting something better, but it was felt that nothing better could then be secured and that the bill had to have the eudorsement of the convention, so it was endorsed. The former officers were mostly re-elected, the regular standing committees appointed and the convention adjourned.

Early in January '93 the United States Senate Committee on Mines and Mining reported favorably on the Caminetti bill, and on the 9th of that month, after earnest debate, the California State Legislature endorsed it. The executive committee of the State Miners' Association asked Senator Felton to have consideration of the bill postponed just as it was about to pass the Senate, because in its amended form it was less than ever satisfactory to the miners. The action of the committee was indorsed by the Chamber of Commerce of this city. The bill passed the Senate February 4, '93, and went back to the House for concurrence. This was had and the bill finally passed with the obnoxious penalty clause modified. The State Legislature unanimously adopted a resolution asking the President to sign it, which he did, aud it became a law March 3, '93. About the same time State Senator T. L. Ford got a bill through the Legislature, appointing a State Debris Commissioner at a salary of $300 per month, and a secretary therefor at a salary of $125 per month, and appropriatiug out of the State general fund $250,000 to be used in the construction of restraining dams, the money to be available only when the United States Government appropriated at least an equal amount for the same purpose. [So far the appropriation is unavailable.]

The Caminetti bill as finally passed was wholly satisfactory to no one. It placed restrictions on the hydraulic miner and was antagonistic to the ideas of the valley residents. It permitted the miners to build restraining dams under the direction of a Government commission and at their own expense. It, however, committed the Government to the rehabilitation of the mining industry of the State, and was and is thus a step in the right direction. It is not all that the miners wanted or should have, but was all that so far they have been able to get.

On May 4, '93, the President appointed the members of the commission who would make operative the provisions of the bill as applying to the working of hydraulic mines in this State on navigable streams or their tributaries. They were and are Col. Geo. H. Mendell, Lieut.-Col. Wm. H. H. Benyaurd, and Major Wm. H. Heuer. Subsequently Lieut. Cassius E. Gillette was added. On June 8 the commission organized and announced itself ready to receive petitions for permits and act thereon. Applications were immediately made and after careful examination were acted upon. Since the organization the commission has constantly and impartially attended to all the applications, and though the duties imposed upon the members of the commission entails no increase in their emoluments, they have not allowed that fact to militate against continuous and intelligent attention to all the duties of the position. To date there have been 159 applications made to the commission for permits to resume hydraulic mining; of these 107 have been granted, and in almost every case the granting of the permit, after careful personal examination, has resulted in the building of the required dam and the resumption of operations, with profit to the owner and without the

slightest damage to the property of others. The efforts of the Federal commission have been opposed by the "Anti-Debris Association," who have maligned the miners, exaggerated all statements, and endeavored to keep alive strife and antagonism. Recently the board of supervisors of Colusa county, realizing that the Federal commission, duly empowered, was doing more than any State organization could do, gave notice that they would cease the former monthly contribution of $100 toward keeping up the organization known as the "Anti-Debris Association." Since then the association's efforts have chiefly been in the direction of assailing the legality of the position of the State member of the Debris Commission—John F. Kidder, of Nevada county—who since its appointment has constantly conferred and co-operated with his Federal colleagues, and in every way possible complied with the requirements of the act creating the position of which he is the incumbent.

The second annual convention of the State Miners' Association—the third meeting of that body—was held in this city beginning October 9th, '93. In his preliminary call President Neff directed attention to existing conditions, the salutary workings of the Caminetti bill, even in its unsatisfactory condition, the need for more vigorous legislation, the necessity for opposition to the opprobrious "Stewart Mining Bill," and the need for prompt action on the perversion of the mining laws by "rulings" of the Interior Department, which made it easy for a corporation to acquire title and difficult for a miner to demonstrate the mineral character of disputed land. The convention was large and harmonious. The secretary's financial statement showed receipts as follows:

Cash on hand	$ 185 14
Collections at convention, November, '92	505 50
Sale of tickets for banquet, '92	300 00
San Francisco	2,337 00
Placer county	256 70
Nevada county	250 00
Yuba county	100 00
Sierra county	100 00
Butte county	17 50
State Association certificates	19 00
Total	$4,070 84

The expenditures were:

Banquet, November, '92	$ 400 00
Headquarters and band	111 00
Convention expenses	231 64
Office rent	360 00
Salary account, secretary and messenger	760 00
Legal expenses—Drafting bills for California Legislature and legal advice thereon	428 50
Niles Searles' expenses to Washington	705 20
Expenses of Delegates Sonntag and Thornton to Trans-Mississippi convention at Ogden	300 00
Total	$3,982 45

Resolutions were adopted adversely criticising the Stewart mining bill, asking Congress to appropriate $1,030,000 for the construction of Government impounding works upon the tributaries of the Sacramento and San Joaquin rivers, and a bill therefor formulated, the regular standing committees were appointed and the convention adjourned. Subsequently the committee appointed to prepare for presentation to Congress a bill embodying the sentiment and action of the convention on several important matters affecting the interests of the miners, drew up a proposed act amending chapter VI of title 32 of the Revised Statutes relating to mineral lands and mining resources. It proposed to define in a clearer manner the method of making locations of mining claims, and outlined other legislation, including some provisions of the Stewart bill and omitting all the provisions of that bill obnoxious to the California miner. It provided that the presence of rock in place bearing gold, silver, etc., should be regarded as presumptive evidence that the land is and always has been mineral in character; made provision defining how land shall be determined to be more valuable for mineral than for agricultural purposes and brought out the claims of the prospector, locator and miner as opposed to the claims of the railroad companies. On January 14th, 1894, the executive committee endorsed the proposed measure.

The annual convention of the association met on Nov. 19th, '94, at the Metropolitan Temple in this city. It was largely attended, 540 delegates being present. For the first time in its history there were outside representations, Montana, Idaho, Utah, Alaska, Washington and other States and Territories having accredited delegates present, in response to an invitation from the executive committee, that body deeming it judicious that as relief was asked from Congress regarding existing mining laws it were well to invite co-operation from other States. The first and second State conventions had been principally devoted to the rehabilitation of hydraulic mining, though the interests of the quartz and drift miners, and the onerous rulings of the Land Department, had engaged some attention. The executive committee on November 7th announced that at the coming convention "the principal subject to be discussed is the revision of the present United States mining laws as applied to locations of claims and the proving up of mineral titles." The convention began its proceedings amid considerable enthusiasm. President Neff congratulated the miners of the State on their improved prospects and the renewed activity everywhere manifest. Gov. Markham delivered an address largely reminiscent and somewhat prophetic; Congressman-elect Barham from the first Congressional district promised in an address to do all in his power in the national legislature to aid the interests represented by the convention; Congressman Hilborn from the third district gave similar assurance; J. M. Wright delivered an address on "Object Lessons in Drift Mining;" State Senator T. L. Ford spoke at length on the question of hydraulic mining and legislation regarding it; U. S. Senator Geo. C. Perkins spoke on the mining interests of the State; A. H. Ricketts delivered an address on "Department Rulings and the Miners;" Gov.-elect James H. Budd pledged himself to co-operate with the miners in all just efforts to secure and maintain their rights; Congressman E. F. Loud did likewise; Congressman Newlands of Nevada spoke at length on the need of favorable legislation at Washington and expressed his desire to heartily aid in the work; Congressman Caminetti spoke of past legislation and future needs, and in the course of his remarks said:

> There is another matter that I think this convention ought to take immediate steps upon; and it is important, for after you pass this law you do not win this fight unless you take other steps. The great trouble, as I have found by correspondence with people who reside in Placer and Nevada, and along the line of the Pacific railroad grant, is that to-day patents are being issued to the railroad for lands that are actually mineral and ought to be given to the miner. Unless you stop that work you will lose the opportunity of getting the valuable mines that are now upon this land and have caused a great deal of trouble. Before leaving Washington, after the adjournment, I called upon the Secretary of the Interior and obtained from him the figures. The total amount of the Southern Pacific land grant in California was about 1,638,000 acres. Up to that date—June 30, 1894—491,000 acres were patented, and on the same date there were pending selections already approved by the officers and only awaiting final decision of the Secretary to be patented by the President of the United States, 414,500 acres, and the balance not as yet located and surveyed, amounting to 732,000 acres. Now, while you people are waiting, while the people throughout the district are doing nothing, the Southern Pacific Railroad, by its army of officers, by its army of perjured witnesses, is going around the district and in the land offices in this State and in Washington robbing, from the people of this State and from the miners, the land that belongs to them. You can do more good upon this question by appointing a committee to take such steps here in this convention as will stop the further issuance of these patents that are now awaiting approval by the Secretary of the Interior. That is important work for you to do, and one-half the battle can be won right here if you do but take hold in earnest and pursue the subject—414,000 acres in the mineral belt now by perjured testimony in one-half of the cases, I have no doubt, awaiting approval in order to be patented; and, once patented, no matter what the rights of the miner may have been, it will be too late then to sue and pass resolutions denouncing this, that or the other. Now is the time to act, and I hope that this convention, holding the interest of the miners of Nevada county, Placer county, and the adjoining country, at heart, will take immediate steps to call upon the Secretary of the Interior, by resolution sent to him by wire, to hold back his decision until the miners of the State can be heard, before these final selections are patented. * * * * Under this departmental made law, against the spirit of our laws, against the spirit of the mining laws, it has been intended to give this corporation lands that do not belong to them—lands that by this decision of the Supreme Court of the United States is plainly said to belong to the people, and any attempt to wrest it from the people by the means that they have resorted to is illegal and a fraud. * * * * The decision is an important one and makes plain our duty, and makes plain what the law is. It might have been declared that way years ago. New light is breaking, and at last the people are coming into their old heritage. The corporations have been notified by the Supreme Court of the United States, not only in this decision but in others, that they must stand upon equal footing with others in the community. This decision here written by Judge Field sets forth all these facts and makes our duty plain.

In accordance with a resolution President Neff appointed a committee for the protection of mineral lands from railroad grants, composed of A. H. Ricketts of Alameda, Chas. G. Yale of San Francisco, Chas. F. Hoffman of Placer, E. C. Loftus of Tuolumne, and Jno. M. Wright of Alameda. Since its appointment the committee has been actively and successfully at work and has accomplished what it was given to do. What further shall be done in this matter is for the convention that meets next Monday to say.

On the second day of the convention the committee on legislation, Messrs. Ford, Belcher and Yale, presented a comprehensive report on "Mineral or Agricultural Character of Land," showing conclusively the necessity of support of that section of the Newlands bill relating to contests between mineral and agricultural claimants of land. The same committee also made its general report, recommending important changes and modifications in existing Federal statutes, notably Sections 2322, 2324, 2325, 2335 and 2337, and recommending an act be presented to Congress appropriating $1,030,000 for construction of restraining dams and impounding works as specified. State Senator C. W. Cross delivered an address upon "Investments in Mines;" Lieut. W. F. C. Hasson read a paper on "The Successful Application of Electricity to the Operation of Mines;" R. H. Campbell delivered an address on "The Hydraulic Gravel Elevator System in Hydraulic Mining;" Congressman Johnson of the Second district pledged himself "to labor for government and to the miner;" A. H. Rose, State Commissioner of Public Works, delivered an address on how to impound debris; J. J. Crawford, State Mineralogist, read a carefully prepared paper, containing mining statistics of the State; Prof. Christy of the State University delivered an address on the mining school connected with that institution, and after several other speeches and the appointment of various standing committees, the former officers were deservedly re-elected and the convention adjourned.

The committee on the protection of mineral lands began its work on the lines of instruction laid down by the '94 convention. The apathy with which its first movements were viewed by the Land Department was changed to hostility by its continued activity. The agent of the California State Miners' Association was denied access to the public Land Office lists of lands selected by the railroad company and not until a protest from the chairman of the committee against such action reached the Secretary of the Interior was the restriction removed. By the first of last March the committee had done considerable in checkmating the efforts of the corporations to swiftly and silently secure title to hundreds of thousands of acres in several mining counties of the State. The nature of some of these selections is illustrated in "clear list 54," published in a Sacramento newspaper, where the selections embraced mineral land in mining towns, and well known gold claims, comprising a section of "the mother lode," taking in such towns as Kelsey, Gold Hill, Colfax; such mines as the Mayflower and West Damascus; such streams as Deer creek, the north and south forks of the American river; such mountain peaks as McKinstry's and Lola; such lakes as Eureka and Meadow lakes—all (according to the railroad claims) "agricultural lands." In April the executive committee sent A. H. Ricketts, chairman of the mineral land committee, to Washington to personally see the President of the United States, the Secretary of the Interior, the Commissioner of the General Land Office, and make such showing as would be fully explanatory of the justice of the position assumed by the California miners, and endeavor to secure suspension of all proceedings in patenting public lands within railroad grant limits in this State till Congress, which meets next December, could take action on the Classification bill introduced in the closing weeks of the 53d Congress. Simultaneous with his departure the Sacramento *Record-Union*, a splenetic newspaper owned and completely controlled by the S. P. Co., began a series of articles and editorial paragraphs opposing the hydraulic mines and daily devoting considerable space to attacking the only paying industry in the State. Its statements were so manifestly false, and its motives so plainly a matter of reprisal on the part of the corporation, that the effect was discounted. It has been asserted that the instigator of the attack, a gentleman prominent in the land department of the company, alleged that in this way he would make the Miners' Association muzzle the mineral land committee. Whether so or not, there shortly appeared a desire in some quarters to repress the zeal of the committee and a suggestion that less ardor in its work would be in order. Chairman Ricketts remained in Washington about a month. He visited all the officials whom it was thought of any use to see, including the President, who wrote him an autograph letter, saying that he had interviewed the Secretary of the Interior on the subject, and had

(Continued on page 234.)

The Effect of Washing with Water Upon the Silver Chloride in Roasted Ore.

By WILLARD S. MORSE, at the Atlanta meeting of the American Institute of Mining Engineers, October, 1895.

In my paper on "The Lixiviation of Silver Ores by the Russell Process at Aspen, Colorado" (Florida meeting, March, 1895), attention was called to the decrease in "chlorination" during the washing of the roasted ore with water, to remove soluble salts, before leaching with hyposulphite and Russell solutions.

This decrease in "chlorination," which is due to conversion of the silver chloride to some other form not soluble in hyposulphite solutions, and which, for the sake of brevity, will be termed the "going back" of chlorination, has been a serious obstacle to the successful operation of several leaching works, and was at Aspen the only difficulty encountered.

I have never seen any explanation of the cause of this failure to extract, in actual practice in the mill, the amount of silver chloride shown by laboratory leachings to be present in the roasted ore; and the purpose of this paper is to record the conclusions arrived at concerning the cause of the phenomenon and the data upon which they are based.

The average decrease in chlorination by washing with water in the Aspen ores for a period of fourteen months was as follows:

	Per Cent.
Silver soluble in a solution of hyposulphite of soda, in the roasted ore, when delivered in leaching vats	78.93
Silver similarly soluble after washing with water for about twelve hours	64.33
Decrease in chlorination, or silver converted from chloride to some other form, not soluble in solution of hyposulphite of soda, by the process of washing with water	14.60

The above calculations are based on results obtained in the treatment of over 30,000 tons of ore, and are computed from the average of several hundred determinations.

Mr. L. D. Godshall, at one time superintendent of the Aspen works, in a "Review of the Russell Process," advances the theory that the "going back" of chlorination is caused by the presence, in the roasted ore, of a reducing agent in the form of sulphurous acid, reducing the silver chloride to metallic silver, insoluble in hyposulphite of soda solutions, and but very slowly soluble in Russell solutions. While superintendent of the works, Mr. Godshall could devise no method to overcome the difficulty, and, in fact, beyond the simple assertion of his opinion, could advance no proof to substantiate his theory.

In the opinion of the writer, the cause of the "going back" of chlorination is principally the presence in the roasted ore of sulphides of the base metals which have escaped oxidation in roasting, and, in the case of the Aspen ores, this result was due to the zinc sulphide, which, during the rapid roasting in the Stetefeldt furnace, did not have sufficient time to decompose. It is well known that zinc blende requires more time and heat for complete oxidation than iron pyrites, and I do not think that in the short time that the ore is subjected to the heat in a Stetefeldt furnace, it is possible to decompose any appreciable percentage of zinc blende present. No difficulty was experienced in roasting in the Stetefeldt furnace charges of ore containing from 16 to 18 per cent of iron pyrites (8 to 9 per cent of sulphur), and completely oxidizing the sulphur; but the table given in this paper shows that, while the raw ore averaged only 1.98 per cent of zinc as sulphide (or 2.95 per cent of blende), the roasted ore contained 1.56 per cent of zinc as sulphide; that is, only about 21 per cent of the zinc blende had been decomposed in the roasting in the Stetefeldt furnace.

The fact that the final apparent extraction of silver in the roasted ore was, by the use of the Russell solution, brought up to 86.74 per cent, or 7.82 per cent more than the amount shown to have been present in the roasted ore as chloride, proved conclusively that, whatever form the chloride had been converted into during the process of washing, it was soluble in the cuprous hyposulphite solutions of the Russell process. This led the writer to the conclusion that the silver chloride had been converted to a sulphide, which is readily soluble in the Russell solution. It was found possible, in mill practice, to extract the silver with the Russell solutions very nearly up to the highest laboratory results.

The experiments of Malagnti and Duroscher, recorded in Percy's *Metallurgy*, showing the reactions between chloride of silver and the sulphides of the base metals, furnished a clue to the cause of the difficulty; and undoubtedly the reason for the "going-back" of chlorinations, in the case of roasted ores containing zinc sulphide, is a double decomposition taking place in the brine solution made by the wash-water and the excess of salt in the roasted ore, expressed by the equation

$$2AgCl+ZnS=Ag_2S+ZnCl_2.$$

The following table shows, I think, beyond doubt, that in the case of the Aspen ores, at least, the zinc sulphide in the roasted ore was responsible for the "going back" of chlorinations.

The determinations given were made by Mr. Stuart Croasdale. In the case of the raw ore the results given are the average of over one thousand separate analyses, made on each lot of ore comprising the run, while the determinations on the roasted ore were made in duplicate on composite samples made up from each charge of about sixty tons. The chlorination tests given are the averages of the tests made on each charge. A few slight discrepancies will be noticed in the table, where the zinc present as sulphide in the roasted ore exceeds that reported in the raw ore. These contradictions can only be accounted for by irregularities in the samples.

A number of experiments made in the laboratory by Mr. C. A. Hoyt, who allowed samples of roasted ore to stand in water in presence of an artificial zinc sulphide, showed conclusively that the silver chloride was decomposed exactly in proportion to the amount of zinc sulphide present.

In March of the present year a very complete laboratory experiment was made for Mr. C. A. Stetefeldt by Mr. Frank A. Bird of Park City, Utah, to ascertain whether the reaction occurred between chloride of silver and natural zinc blende, and thus to confirm or disprove my contention, that the unoxidized zinc sulphide left in the Aspen ores after roasting in a Stetefeldt furnace was responsible for the "going back" of chlorinations.

TABLE I.—SHOWING THE PERCENTAGE OF ZINC AS SULPHIDE IN THE RAW AND ROASTED ORE AND THE PERCENTAGE OF DECREASE IN SILVER CHLORIDE BY WASHING THE ROASTED ORE WITH WATER.

MIXTURE NUMBER.	Raw Ore in Mixture.	Zinc in Raw Ore.	Zinc as Sulphide in Raw Ore.	Zinc as Sulphide in Roasted Ore. 11	3.18	0.68
10	0.51	1.15
14	0.24	0.97

The result of Mr. Bird's experiment shows conclusively that such a reaction occurs, and that it is more pronounced in a brine solution than in a solution of hyposulphite of soda. This would confirm my theory, as the ore roasted with 10 to 12 per cent of salt contains an excess of sodium chloride, and the wash-water becomes, practically, a brine solution.

The following is Mr. Bird's report:

REACTIONS BETWEEN ZINC-BLENDE AND SILVER CHLORIDE.

$$2AgCl+ZnS=Ag_2S+ZnCl_2.$$

"Two samples of zinc blende were used: one of crude ore, the other partially roasted. Crude ore was first ground on an iron plate to pass a 60-mesh screen, and a portion was then roasted 22 minutes, with frequent stirring, in a muffle kept at red heat. After this partial roast, the portion was regrounnd in a porcelain mortar to pass a 60-mesh sereen.

"Analysis of the crude and partially roasted ore gave the following results:

	Crude. *Per cent.*	*Partially Roasted.* *Per cent.*
Zinc	55.30	58.20
Sulphur	37.17	16.47
Lead	6.00	4.70
	Ozs. per Ton.	*Ozs. per Ton.*
Silver	4.4	5.6
Or 2.2 milligrammes in 0.5 A. T.	2.8 milligrammes in 0.5 A. T.	

"Six samples of 0.5 A. T. of each class were taken; to each of three of them was added 100 c. c. of a concentrated solution of sodium chloride containing silver (Solution A, below), and to each of the other three was added 100 c. c. of a concentrated solution of sodium hyposulphite ($Na_2S_2O_3$) containing silver (Solution B, below).

TABLE III.—SHOWING RESULTS IN FOREGOING EXPERIMENTS.

Time in Which Samples Stood in Solution.	Brine Solution, Containing 64.1 Milligrammes of Silver in 100 c. c. Crude. Assay.	Brine Solution, Containing 64.1 Milligrammes of Silver in 100 c. c. Crude. Precipitated.	Brine Solution, Containing 64.1 Milligrammes of Silver in 100 c. c. Crude. Per cent.	Brine Solution, Containing 64.1 Milligrammes of Silver in 100 c. c. Roasted. Assay. Hyposulphite Solution, Containing 100 Milligrammes of Silver in 100 c. c. Roasted. Precipitated.	Hyposulphite Solution, Containing 100 Milligrammes of Silver in 100 c. c. Roasted. Per cent.
Hours.	Mgs	Mgs	Per cent	Mgs	Mgs	Per cent	Mgs	Mgs	Per cent	Mgs	Mgs	Per cent
6	44.78	42.58	66.43	13.42	10.62	16.57	40.42	38.22	38.22	11.1	8.3	8.3
12	40.64	38.44	59.97	17.60	14.80	23.09	45.00	42.80	42.80	12.38	9.58	9.58
24	45.40	43.20	67.39	17.20	14.40	22.46	51.78	49.58	49.58	12.88	10.08	10.08

"After the samples had stood for the time shown in Table III, they were filtered and washed until no reaction was obtained for silver, and a hot 20 per cent solution of sodium chloride was used to wash the samples that had stood in Solution A, and cold water to wash those that had stood in Solution B.

"After washing, the residues were assayed, with the results given under the heading 'Assay,' in Table III, in milligrammes of silver. From the total silver found in the residne the amount contained in the original sample is deducted, and the remainder, being the amount precipitated from the solutions, is given under the heading 'Precipitated.' The percentage thus precipitated was calculated upon the total silver in the solution in which the sample had stood.

"*Solution A: Sodium Chloride (Brine) of 22.6° B at 60° F.*—A saturated solution, made with pure water and commercial sodium chloride, was filtered, heated to boiling, and again passed through a filter upon which was one gramme of silver, freshly precipitated as chloride. After passing it through the filter once, to loosen all particles of silver and wash it down into the filter point, the silver was washed with hot brine into the salt solution, and boiled until it was all in solution, and then the solution was made up with hot brine to exactly one liter. Upon cooling to the normal temperature, some silver chloride precipitated out, and as it was found impossible to make a stable compound, the solution was finally tested for silver, and found to contain 64.1 milligrammes per 100 c. c.

"*Solution B: Sodium Hyposulphite of 1.5° B at 60° F.*—Twenty grammes of commercial sodium hyposulphite were dissolved in pure cold water, and passed repeatedly through a filter, upon which was one gramme of c. p. silver, freshly precipitated as chloride, until it was all in solution. The solution was then diluted exactly to one liter, so that each 100 c. c. contained 100 milligrammes of silver.

"*Note.*—Before either solution was run over the silver chloride, the latter was washed until no reaction was given with silver nitrate.

"All figures are based upon the commercial assay."

Mr. Godshall, in his paper cited above, assumes that the effect produced by zinc sulphide in the roasted ore is due to the production, by the oxidation of the zinc sulphide on the cooling floor, of sulphurous acid, which reduces the silver chloride to metallic silver, and that this metallic silver is afterwards extracted by the Russell solutions. I question the correctness of this theory; since metallic silver is, at best, only slowly soluble, while sulphide of silver is readily soluble in the Russell solutions. In every case the final extraction of silver in the mill by the Russell solution was higher than the best extraction in the laboratory by hypo-solutions, showing that the Russell solution not only extracted the silver that had been changed from a chloride by washing, but also an appreciable percentage that had never been converted to chloride in roasting, and presumably remained in the ore as a sulphide of silver. The examples given in Table IV will illustrate this statement.

TABLE IV.—EXCESS OF EXTRACTION BY RUSSELL SOLUTIONS.

MIXTURE NUMBER.	Highest Laboratory Extraction by Hyposulphite Solutions. Roasted Ore.	Highest Laboratory Extraction by Hyposulphite Solutions. Washed Ore.	Decrease in Chlorination by Washing.	Final Extraction in Mill by Russell Solutions.	Extraction by Russell Solutions over best Extraction by Hyposulphite.
	Per cent.	Per cent.	Per ct.	Per ct.	Per cent.
4	71.16	34.00	37.16	80.8	9.64
12	82.33	79.15	3.18	90.5	8.17

In connection with the subject of the mutual decomposition of the sulphides of the base metals and chloride of silver, the result of turning this reaction to practical account will be of interest. During the operation of washing with water to remove the soluble salts, about 14 per cent of the silver was removed from the roasted ore by reason of the excess of sodium chloride present in it, silver chlorides being dissolved in the brine thus formed. The product from precipitation of the wash water with sodium sulphide was very low in silver (600 to 1000 ounces of silver to the ton) on account of the presence of

lead, which was also precipitated as a sulphide by the sodium sulphide.

The reaction, $2AgCl + PbS = Ag_2S + PbCl_2$, was utilized with splendid results. After a few lots of wash water had been precipitated with sodium sulphide, and a stock of precipitate, consisting mostly of lead sulphide, had been thus obtained, the wash water from the ore was run into the tanks, and the accumulated lead sulphides were thoroughly mixed with the wash water by agitating with compressed air for about two hours. The result was a complete precipitation of the silver chloride in the wash water, and the stock of precipitates first made was constantly increased in grade of silver. The saving effected was not only in the decreased cost of sodium sulphide for precipitation, but also in the decreased cost of refining the product.

In conclusion, I believe that the reactions occurring between chloride of silver and the sulphides of the base metals are of great importance in the leaching of silver ores, either with brine, hyposulphite of soda or the Russell solutions; and, from all the information I can gather, this point seems to have been overlooked by those who have investigated the subject, or at least by those who have published the results of their investigations.

The Gold-Silver Veins of Ophir.

NUMBER II.

By WALDEMAR LINDGREN.

Movement Along the Vein—Relative Age and Genesis of Vein Systems.—The opportunities for examining the junctions of the veins were not so good as would have been desirable. It seems, however, very probable that the veins of the first and second systems were formed at the same time. They do not appear to fault each other to any noticeable extent, and the Saint Lawrence vein, for instance, continues unbroken from the direction of the first vein system to that of the other. According to reliable information, it is frequent to find two veins at their crossing pinch out without faultiug; it is also said to be usual to find two veins when approaching each other simply join without faulting or cutting out. The north-south veins, which are few in uumber, are said to frequently cut off the east-west veins; so, for instauce, it is stated that the Brushfence mine is cut off a few hundred feet beyond the shaft by a heavy north-south vein, though I could not convince myself beyond doubt that such was actually the case. The flat Morning Star vein is certainly cut and faulted a few feet by a nearly perpendicular stringer running north-northeast. In the Plantz mine I aui informed that several smaller cross veins are cut and faulted, sometimes also bent, by the main ledge. The shaft is not now accessible.

Striations and slickensides are very common on the veins, and generally indicate more or less horizontal motion. At the same time it may be said with considerable confidence that no faults of large throw have taken place, for many of the veins cross the granodiorite contact without displacing it to any noticeable extent. Near the principal vein systems it is not uncommon to find the adjoining rock divided in sheets one foot or more in width. Such sheeting of the amphibolite may be noticed in Auburn ravine in the vicinity of the Floyd and the Oro Fino veins, and at several places along the vein system west of Crater hill.

The amphibolite often shows evidence of a movement parallel to the planes of schistosity, which probably in most cases took place before the veins were formed. Aloug these planes chlorite and mirrors of polished pyrites are usually fouud. The striations on the veins sometimes run down parallel with the pitch of the deposit, but it is, as stated above, much more common to find them running more or less horizontally, and they are usually most marked on the hanging wall. On the Gold Blossom vein the striations, which are often coarse, almost appearing as a corrugation of the sides of the vein, dip west from 10° to 20°. In the Conrad tunnel the inclination of the striations were measured on the hanging wall to 58° east, 50° east, and in one place 30° west. On the Hathaway the striations are very marked and dip west constantly at angles of 40° to 50°. They are not only found in the hanging wall, but in many places the whole vein, which is about 2 feet thick, is divided into sheets, produciug the effect of a ribbon structure. The faces of the dividing planes are covered by scales of chlorite and minute crystals of iron pyrites. They have a slightly wavy or curved surface and are rifled by narrow and straight striations. The thickness of the sheets varies from a few millimeters up to several centimeters. It was suggested that this structure might be due not to a sheeting of the quartz vein, but to the replacement of sheeted and striated wall rock by quartz, so that the present striations would be simply the reproduction in quartz of the original slickensides of the country rock. The faces covered with chlorite and separating the sheets might be considered as the only remains of the replaced striated country rock. Such an explanation is, however, wholly untenable. Vugs and cavities lined with crystals are often found in the thicker sheets, as well as other indications of deposition in open fissures. Moreover, many thin sections cut across the sheeted veins indicated beyond doubt that the quartz was not deposited as a mold reproduciug striations; on the contrary, indicatious of extreme pressure were most evident. The dividing planes were found to correspond to lines in the sections along which comminution and crushing had occurred to an extraordinary extent, converting the original coarse grained quartz aggregate, which still remains in many places between the dividing planes, into a fine grained aggregate.

Replacement of country rock by quartz and ores doubtless frequently occurs, but that the Ophir vein systems principally consist of quartz-filled fissures ouce open appears to me beyond doubt. It does not follow that they were open throughout, for it is common enough to find even the heaviest veins occasionally "shutting down" and the fissure narrowing to a seam, thus affording support to the walls. Moreover, it does not seem possible that the country rock could be converted into a pure coarse granular quartz aggregate without some remaining indications of its original structure. In the case of the altered wall rocks it is certain that, however profound the chemical changes, the original structure and grain have to some extent been preserved.

Mr. S. F. Emmons has recently, and with excellent reasons, called attention to the fact that "many so-called fissure veins are formed by percolating water circulating along joints, shrinkage cracks, fault planes, or zones of crushed rock, which have filled the interstitial spaces and replaced the materials of the adjoining country rocks to a greater or less extent by the materials they held in solution, but are not the filling of any considerable open cavities."

In very many cases this view is undoubtedly correct, but I do not think it can be applied to the veins described in this paper. Fissure veins with comb structure and other evidences of filling of preexisting cavities do not seem to me to be quite so rare as Mr. Emmons states, and among the gold quartz veins of Califoruia one does not have to search far to find them.

On the cropping of a quartz vein near the gravel hill two miles north of Auburn, on the Clipper Gap road, an interesting structure is observed. The vein projects for about 16 iuches above ground through the decomposed schists; its hanging appears as a smooth and polished wall. A closer inspection reveals the fact that a part of the apparently uniform surface consists of breccia of quartz fragments several inches or more in diameter, each of which is striated in a different directiou; in another part of the cropping the original striation does not seem to have been disturbed and is nearly horizontal. The explanation of this seems to be that subsequently to the movement to which the origiual striatiou was due another disturbance took place, which brecciated the vein, and that this breccia was soou afterwards pressed together and cemented. A thin section of the quartz from this place shows that it has a fine-grained quartzite structure, and that the individual grains are usually extremely pressed, broken, and crushed.

This quartz vein is at the same level as an adjacent hill of Neocene gravel and volcanic deposits, and consequently cropped out on the surface of the range in Neocene times. Nearly the same is true of the Gold Blossom and Hathaway veins, the striated surface croppings of which can only be a short distance below the Neocene surface.

It seems evident that phenomena such as those described above—sheeting, striating, brecciating, and recementing—could not have taken place except at considerable depth below the surface, and that we are, therefore, justified in believiug that a considerable extent of the vein had been already eroded in Neocene times. Just how deep the croppings on the Neocene surface were below the croppings at the time the veins were formed is not easy to tell; but the amount of the erosion is most probably not less than 1000 or 2000 feet—it may have been very much more.

Concerning the age of the veins, nothing more definite can be said at present than that they are later than the granodiorite, which again is later than the Jurassic or early Cretaceous Mariposa beds. On the other hand, they are older than the Neocene deposits overlying them.

Mr. G. F. Becker has shown that direct pressure applied to a mass presenting great resistance to deformation will induce fractures along the lines of greatest tangential strains, and four systems of fissures may be formed; in the common case, however, that there exists any inequality of resistance in the plane perpendicular to the line of pressure, the rupture will take place only along planes perpendicular to that of the greatest and least of the axes of the strain ellipsoid, aud two systems of fissures will be formed, separating the mass into columns. The direction of the compressive stress is perpendicular to these columns, and in usual cases bisects the obtuse angle between the fissure systems. An experiment by Daubree, an illustration of which is copied in Mr. Becker's paper, confirms these deductions.

These conclusions appear to offer a solution of the problem of the direction of the force which produced the principal fissure systems of Ophir.

Leaving out of consideration for the present the few and unimportant veins which run north and south, there are in the Ophir district two systems of fissures, according to the best evidence, formed and filled at the same time; roughly speaking, they cut each other at an angle of 45° and all dip southeast or southwest at angles ranging from 30° to 70°. The compressive stress that formed the fractures evidently bisected the obtuse angle between the fissure systems, that is, had a north-northwesterly direction about parallel to the trend of the Sierra, and was inclined downward at angles ranging from 30° to 70°. Most prevalent is a dip of 50° or 60°, which would correspoud to an inclinatiou of the force of 30° or 40°. The compressive stress not only produced these fissures, but, continuing to act for some time, or being repeated even after the fissures had been filled, the columns ground against each other, producing slickensides and striations.

As fissure systems with this direction are uncommon in the Sierra Nevada, it is likely that exceptional conditions produced a local compressive stress or intensified it in an uncommon degree.

As soon as the fissures had been formed they offered special faeilities for heated subterranean waters to circulate, and were soon filled with miueral solutions containing silica and carbonates, as well as small quantities of heavy metals, probably dissolved in alkaline sulphides. It is probable that the solutions already contained gold, silver, etc., derived from unkuown sources when ascending, but than encountering ecxeptionally auriferous wall rock in the iron belt a local enriching process took place. Concerning the principal source of the metals nothing definite can be said; more extensive observatiou, and especially more chemical examinations than have been made for this paper, are needed. A certain part of the gold and silver, in all probability, came from the amphibolites, but this is only referring the question one step back, for the accumulations in the amphibolites are themselves of secondary nature.

CONCLUSIONS.

The quartz mines of Ophir are located near the contact of a massif of grauodiorite of late Mesozoic age with older, post-Carboniferous, probably also Mesozoic, amphibolite schists. The latter contain belts or zones impreguated with iron pyrites in part at least auriferous, and which correspoud to the "Fahlband" of German and Swedish authors. The quartz veins principally belong to two systems, one west-northwest and the other northeast in direction; all the fissures dip southeast or southwest at angles ranging from 30° to 80°.

The principal valuable mineral is native gold, usually containing so much silver as to be classed as *electrum;* besides a small amount of sulphurets, such as iron, copper and arsenical pyrites, galena, zinc blende, tethrahedrite, and molybdenite. The gangue is principally quartz, filling the fissures, which are from a few inches to 3 feet wide. Calcite is subordinate in quantity. While practically all the quartz is auriferous, the richer ore is concentrated in pay shoots or chimneys; those in the granodiorite are low grade, rich in silver and very extensive; those in amphibolite are mostly rich, contain less silver and are of small extent in width and depth, sometimes only "pockets." When the quartz veins cross the iron belts the richest pay shoots have been found; all the pay shoots appear to have an easterly dip on the plane of the vein. The adjoining wall rock is both in amphibolite and granodiorite altered to a calcite-sericite aggregate, while there is but little calcite in the veins proper.

The fissure systems have, in all probability, been formed simultaneously by a compressive stress acting in a direction parallel to the trend of the Sierra, and the fissuring was atteuded with considerable horizontal motion. Hot siliceous and carbouated solutions containing heavy metals dissolved in alkaline sulphides ascended the veins, altering the wall rock and depositing the silica and ores iu the largely open fissures. Actiou of percolating surface waters seems out of the question. The auriferous iron pyrites of the iron belt were probably a source of local euriching of the veins, but the derivation of the largest part of the precious metal must as yet be considered an opeu question.

Bones of the "Missing Link."

A good deal of publicity has been given a recent interview with Prof. J. L. Wortman of Columbia College, N. Y., in which the professor related his find of the bones of the "missing link, a being that lived and moved 150,000 years ago." These remains of the original man were carefully wrapped in cotton and transported to the fire-proof museum in New York. The priceless bones were found by the professor and a party of scientific students near the head of the historic Bitter creek, near the Wyoming-Colorado line. The professor's interesting find has caused merriment among the old-time cattlemen of that section, as the bones were the skeleton of a pet monkey owned by cowboys, which died twelve years ago.

A tradepaper advertisement costs less than circulars and postage, is less trouble to circulate, and is sure of being read.

The California Miners' Association.

(*Continued from page 231.*)

referred Mr. Ricketts' statement to him. The executive committee met on June 6, when Mr. Ricketts made a report regarding his mission and its results. Treasurer Sonntag read a report showing that the receipts from Nov. 1st, '94, to June 1st, '95, were $4101.52, and the dishursements for the same period $4071.47. A suggestion that the railroad company was desirous of arhitration or compromise was not acted upon and a motion that the mineral land committee be authorized to continue its work and assured payment of its expenses was unanimously adopted. Suhsequently Land Commissioner Lamoreaux dismissed the protests made hy the committee against issuance of patents to the company, on the ground that they were not specific. The matter was appealed to the Secretary of the Interior.

Meanwhile the legislative committee was not idle. Under instructions from the '94 convention two hills were prepared last June, one amending chapter six of title thirty-two, Revised Statutes; another making provision for appropriation of $1,030,000 to be expended under the direction of the Secretary of War, in accordance with the plans and specifications of the Debris Commission, for the construction of works for the restraining and impounding of mining debris upon the tributaries of the Sacramento and San Joaquin rivers in this State.

The report of the California Debris Commission for the year ending June 30, '95, showed that to that date 139 applications for permits had heen received, of which 69 per cent had been granted. The report estimated that the total amount of material mined under the granted permits for the nine months from October 1st, '94, to June 30th, '95, was 900,000 cuhic yards; that available storage had been provided for 5,000,000 cuhic yards. Regarding the proposition of building permanent dams in river canyons or in the tule land of the Sacramento valley and other projects, the report said: "While the commission does not helieve any of these plans to he economical and practicable, it is unahle from lack of data to state even approximately the cost involved."

At a meeting of the executive committee on August 9th it was decided to take cognizance of the proffer of the railroad company to arhitrate the mineral land question, and that till the Octoher convention the matter he left in the hands of the present committee. A communication to W. H. Mills, representing the land department of the Central Pacific Railroad Company, was sent on the 20th of August, asking him to state the corporation's views in the matter. He replied the following day, stating his desire for concurrent action to have the entire question speedily and definitely settled. He indicated a plan which, after consideration hy the committee, was rejected, in a communication of September 17th, which outlined the terms under which the committee would he willing to treat with the company. On the 25th Mr. Mills replied, suggesting that he was empowered to act only for the Central Pacific Company. The same day the committee answered him, accepting the amendment. It was not helieved that anything would come of the negotiations. The demands made hy the corporation would not be a compromise, hut a surrender, if agreed to hy the committee, and the suggestions of the committee, while just to hoth sides, were too impartial to suit the purposes of the corporation. On October 1st Mr. Mills addressed another communication to the committee, enclosing a draft of a proposed basis of compromise, which received the earnest attention of the committee, and after consultation was, on the afternoon of the 3rd, declined affirmative consideration. The chief reason for its rejection by the committee was because of its amhiguity and indefinite construction. In a letter to the railroad representative, dated Oct. 7th, the committee sets forth in detail its reasons for such rejection. The matter was left open, and any time that the terms as proposed by the committee can he acceded to hy the corporations their overtures will receive favorahle consideration. It is not a matter of antagonism to anything or anyhody on the part of the committee, hut a desire to protect the interests of the miner and faithfully fill the trust delegated to its members at the last annual convention.

In the foregoing is briefly set forth much that has been done from the inception of the movement. That the same zeal, justice, intelligence, efficiency and harmony that have hitherto characterized the acts of the association will continue to guide its deliberatious is the sincere wish of all interested in the mining interests of our State and all the many interests connected therewith.

Concentrates.

G. W. Grayson, Jr., has bonded the Horsehead mine, Josephine county, Or.

The new 100-stamp mill of the Golden Cross Mining Co., at Hedges, Cal., hegan work last Monday.

The new 5-stamps at the Uncle Sam mine, Shasta Co., making 35 in all, hegan dropping this week.

Six more Nevada county miners leave this week for South Africa, where they have heen proffered positions.

Leigh Harnett is completing a series of well-written articles on the hydraulic mines of southern Oregon.

Sixty additional stamps and twenty-four concentrators are contemplated hy the Alaska-Mexican Co. early in '96.

Lane & Hobart, owners of the Utica mine, have bought for $50,000 the Santa Rosa mine from Cox & Stockton of Madera.

Electricity, of Octoher 2, devotes a paragraph to the absurdity of Geo. D. Burton's "refractory ore smelting electric furnace."

R. A. Davis is opening up the Sailor gravel claim in Sailor canyon, Placer Co., and expects to do considerable work next winter.

The new town at the Bulldog mine in Pinal county, Arizona, has heen named Hirschfeld, after one of the owners of the Bulldog.

Pittsburg people have bought a controlling interest in the Rosedale mine, San Marcial, Arizona, and will put up a 5-stamp mill.

H. D. Ranlett is opening up his copper mine near Ione, Amador Co. A new postoffice—Ranlett—has been established at the mine.

Articles of incorporation of the Iron Springs Gold Mining and Milling Company have heen filed in Prescott, Ariz.; capital stock, $1,000,000.

About sixty men are now employed at the Enterprise mine, Johnsville, Plumas county, mostly in preparatory work for next winter's operations.

St. Louis men have an option on the gold properties of the Bald Mountain Mining Company, located in Sevier county, Utah, the consideration heing $100.000.

Last month the Arizona Copper Company paid a dividend—the first in its history. With improved processes, the *Oasis* says, it profitably reduces 3 per cent ores.

Two steam arrastras at the Catskill gravel mine, Bangor, Cal., each grind 35 carloads of 1200 pounds each every twenty-four hours. Twenty-five men are employed.

The *Miner* figures that there are 2500 men at work in the 163 shipping mines of Cripple Creek, and that the gold output of the district is nearly one million dollars per month.

The *Democrat* thinks that ninety per cent of the people of Marysville and Yuha county are in favor of the construction of a restraining wall on the Yuba river at the foothills.

In the vicinity of French Gulch, Shasta Co., ahout sixty men are employed at the Gladstone and forty-five at the Niagara, and other mines give employment to as many more.

In the New Treasure mine, near Sunny South, Placer Co., J. B. Sellier proposes to run ahout 3000 fbet of tunnel westerly to tap the Golden river channel, now being worked from Red Point.

The Northwest Miners' Association, of Spokane, sends W. E. Everett, W. C. Butler and Duncan Ross as delegates to attend the meeting of the California Miners' Association next Monday.

A 5-stamp mill is to he huilt at the Crystal Hill mine, Butte Co., to he run by water power from the Mooretown ditch under a 235-foot pressure. G. W. Price of Forbestown is superintendent.

The Colorado men who recently purchased a controlling interest in the Sevier, Utah, gold mine for $98,000 are preparing to erect a 200-ton mill, a combination stamp and eyanide process, to cost $100,000.

Considerable Eastern capital is finding present profitable investment in El Dorado county. The Pocahontas mine, formerly a good producer, is to be reworked, and other adjoining properties are to be acquired.

The hig stack at the matte furnace of the Anaconda, Mont., company lacks a few inches of being 200 feet high; it is 60 feet in diameter at the base and 22 at the top; 2,250,000 hricks were used in its construction.

The Silver Rule group of mines have heen sold hy Laughlin Bros. to W. A. Clark of Butte, Mont., for $20,000. They are five in numher, situated four miles from Argenta, Mont., are rich in silver and carry a little copper and lead.

The South Paloma Gold Mining Company has incorporated here; directors, J. A. Wright, J. M. Cunningham, S. V. Smith, E. C. Voorhies, M. B. Kerr; capital stock, $15,000, all subscribed. The company will operate in Amador county.

Messrs. Bell, Urquhart, Harrison, Russ and Phillips of this city have organized a company to open up the Mayhell hydraulic claims near Kerby, Curry county, Or. A ditch and flume are to he huilt, pipe laid and three giants put in.

The Styne Creek Consolidated Gold Gravel Company, limited, of Vancouver, B. C., has been incorporated, capital $250,000, to acquire the property and interests at Van Winkle bar on the Fraser river in the Yale district, and consolidate.

The Tellurium group of mines on Admiralty Island, Alaska, which have heen sold for $50,000, average $15 in free gold and $110 in sulphurets. The Alaska-Willoughby Co., recently incorporated, will put up a 10-stamp mill and complete outfit.

A treaty has been signed hy the Blackfoot Indians to cede to the Government a large section of tho Blackfoot Indian reservation. The consideration is $1,000,000. The ceded portion includes some of the most valuahle mineral land in Montana.

The Carson Creek Extension mine is sold to tbe Carson Creek Mining Co. The Extension adjoins the Carson Creek on the south and extends from Carson creek to and across the Stanislaus river to Tuclumne. The mine is peculiar in tbis, that it is a solid body of limestone, through which courses the west hranch of the mother lode. It is to the close proximity of the lime that the Carson Creek mine owes its high per cent of silver values.

There is a temporary check in the financial craze in London in South African mining shares, irreverently known as the "Kaffir circus," hut the mania has not yet run its course, and not till the knowing ones hegin to unload will the inevitable crash come.

The commercial aspect of Witwatersrand mining journalism is exemplified by a ten-page advertisement of one concern, in the South African *Mining Journal* of August 31st, setting forth its status, advantages of a certain process, statistics of production, etc.

California is supplying the South Africa gold mines with experienced miners, mine foremen and superintendents, and, with other parts of the United States, machinery and apparatus. Oregon and Washington furnish timher for buildings and mine work.

The Squaw Lakes Water and Mining Company has incorporated here; capital stock, $1,152,000—J. W. Northup, $444,600; J. Knox, $444,600; W. Knox, $222,400; W. W. Thayer, $40,000; C. T. Dennis, D. Sutro, W. Gregory and A. N. Hungerford, $100 each.

The Nevada *Transcript* says the flood that occurred in the Harmony mine a short time ago has spoiled the chances of the underground ball taking place there, at least for quite awhile, as the big chamber selected for the ball-room is now very muddy and will he for some time.

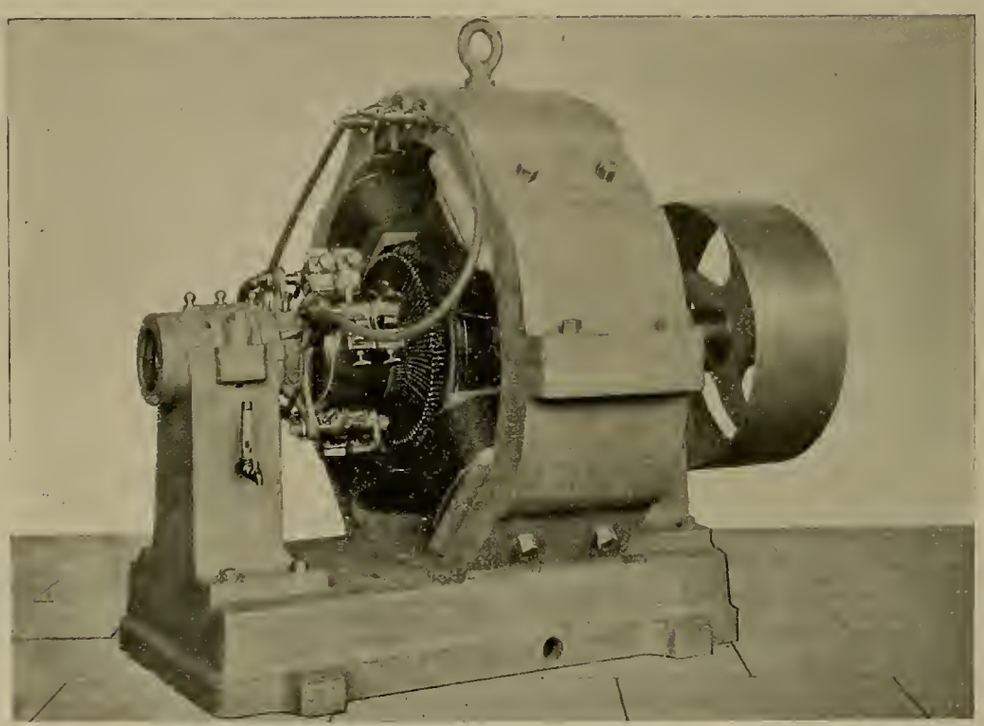
Work on the Mammoth-Collins group, north of Tucson, Arizona, will be hegun November 1st. The delay was due to the illness of the new superintendent, Mr. Goodyear of London. The new Mammoth Company is now all English, the foreign stockholders having hought out the American interests.

This journal is informed that "Yuma capitalists will soon hegin the erection of a large smelting plant at Castle Dome for the reduction of lead and silver ores from the mines near that place," and that "electricity for the works will he furnished hy water power taken from the Yuma irrigating canal," hut it doesn't helieve a word of it.

Mr. John Davidson, recently connected with South American hydraulic mines, has patented a river mining apparatus and thinks his river boat can he made to pay handsomely on the Feather river. If the owners of land on that river will grant him the privilege of mining he will furnisb the machinery and labor and pay for the use of the ground out of the earnings.

Since '86, when operations hegan in the Broken Hill mine in Australia, it has yielded over 70,000,000 ounces of silver and 300,000 tons of lead. For the past six years it has paid £6,000,000 in dividends. In the first three years it paid about $500,000 a month in dividends; but since the fall in the price of silver, it has been paying ahout $250,000 a month. There are about 16,000 stockholders in the concern.

The best paying hlack sand heach mine that bas heen discovered on this coast is near Port Orford lighthouse. The claim, when first discovered nearly forty years ago, was yellow with gold for over twenty feet in width and three feet in depth, and paid $200 a day to the man. This claim is being worked this year for the fourth time hy leasers. The sand is thrown on a grizzly, carried over amalgamated plates to catch the gold and over moha'r clotb to catch the platinum. The platinum is worth $4.50 an ounce.



The Northwest Mining Association organized at Spokane, Wash., last week hy the election of G. E. Dennis, president; A. P. Curry, vice-president; L. K. Armstrong, secretary, and W. J. C. Wakefield, treasurer. One hundred delegates were present from all parts of the Northwest. Senator Duhois of Idaho addressed the convention on the silver question and government sampling of lead ores and F. Ganahl on mining laws. The convention was also addressed hy Congressmen Doolittle and Hyde of Washington; W. D. Gallagher of Salt Lake; C. F. Fishback of Tacoma and Governor McConnell of Idaho.

J. T. Smith of Montana, J. D. Bancroft and R. M. Green have sued John W. Mackay, E. Bind, L. Reeg and A. Head for $200,000 damages. The plaintiffs claim that last May Smith agreed, with two of the defendants, to buy a group of mines in Pleasant Valley district, El Dorado county, for $60,000 and got an option on the property. Then he offered the property to Mackay for $250,000, who sent experts to look at it. Now plaintiffs claim that Reeg and Bind ignore the terms of the option and are trying to sell the mines to Mackay; that they are injured to the extent of $200,000 and want judgment for that amount. Reeg and Bind say that the option expired September 1st; that they refused to renew it, and have a right to make such disposition of the property as they see fit.

The interest felt in Montana over the same question that the committee on protection to mineral lands of the California State Miners' Association has in charge was shown at Helena last week, when the meeting of the mineral land commission was atteuded hy the Governor, hoth U. S. Senators and many of the prominent men of the State. The commission has examined 219,690 acres, 59,250 of which are classed as mineral and 160,400 as agricultural lands. Counting every expense to the government, the cost per acre to classify bas heen 2½ cents. Excluding the cost of advertising, which under any system of classification would he necessary, the cost per acre has heen 1.8 cents. Excluding the expense of getting ready to take the field, and hasing the other expenses on the experience of the past, the actual prospective cost of classification per acre will he 1.3 cents. T. G. Merrill says: "We have sent out some 8000 hlank affidavits giving the exact location of mining claims upon each 40 acres. These specific affidavits, which have heen returned to the commission for use, cover over 10,000 acres of our mineral lands. We have also received about 300 affidavits from the owners of mining claims in unsurveyed lands giving as near the exact location of their claims as was possihle. These affidavits are placed in the hands of the United States commissioners when they are ahout to examine the lands upon which these mining claims are situated. A perfect copy of these affidavits has heen kept, in order to have them for future use if necessary. Several thousand letters have heen written to us in answer to those seeking information as to the necessary steps to he taken to secure the correct classification of the lands upon which the mining claims are located."

Scientific Progress.

Gold Ores of Mercur, Utah.

The theory of the sedimentary origin of the gold ores of the Mercur, Utah, district is opposed by J. H. Lane, who, after a second visit to the district, has a different idea as to their origin. He claims that it is a contact vein, but does not lie as far below the surface as most veins of that character, and holds that every hill in the district has at one time carried its portion of that vein, and would to-day had it not been scoured away by the action of the elements. Another feature is that the vein is badly faulted, and it is possible for a claim to have more than one apex within its boundaries, and this idea has been demonstrated in several of the locations, some of which exhibit as many as three apexes—that is, every fault has its own apex somewhere, and several of these may occur on one location. The district, he thinks, resembles the Johannesburg, South Africa, country. In Johannesburg is a large porphyry dyke cutting the formation from east to west, and it is in the overflow or offshoots from the porphyry that are found the values—that is, in the channels from the porphyry. These channels are, or were, the channels of hot sulpho-saline and alco-saline water that formerly contained the gold in solution, which accounts for the mineralization of the lime in some places, which may penetrate to a great depth. This should aways occur on the footwall and near the porphyry dyke, where in South Africa is found the highest values. Where the values are distant from the dyke, it is nearly always on the same feeders that ultimately lead to the porphyry. His observations in Mercur lead him to the conclusion that the conditions are almost identical. The slates and talcs are similar, and in the Mercur are the same oxidized arsenical ores that are in South Africa. The channels and the general ore zone are longer and wider than in Johannesburg. The upper part of the vein is porphyry and talc, the ore lying below the porphyry, and in many instances being mineralized to an extent equalling the values in the true ores.

On the same subject, Henry Rives Ellis of this city writes us as follows:

"There has been a great deal said in relation to the Camp Floyd mining district, Utah, concerning the condition of the gold and also of the deposition of the calcareous quartz vein in which it is found. I had occasion to visit the district in the neighborhood of the town of Mercur for a limited time, and observations made under and above ground in that vicinity lead me to the conclusion that the vein is one of replacement, and not of sedimentary deposit, as claimed by some.

"The ore, or ore zone, if I may so call it—as there are two veins separated by a few feet of mineralized lime—is overlaid by a shaly rock and underlaid by lime, causing a waterway through the country through which the alkaline sulphide solutions passed, carrying the silica and metallic sulphides, depositing them *pari passu* with the taking into solution a portion of the limestone.

"The fossils, which were enveloped originally in the lime, and now in the ore, which have lead some to think that the ore was deposited by sedimentation, are merely evidences of replacement; for, as the lime enclosing the fossils was dissolved, it was immediately replaced by the ore without changing the position of the fossils, and appearing to the eye as though nothing had taken place.

"The vein is of the bedded type and was formed probably while the country was flat, or nearly so, and subsequently tilted, broken and eroded.

"It has been said very often that the gold in the ores of this district was a chloride or some other form soluble in water, the alkalies or their sulphides. This I have proved to be erroneous, and that the gold is chemically uncombined, but is in a metallic state."

The Telephone Newspaper.

The Buda Pesth telegraph newspaper was founded by Theodore Puskas, and has turned out an extraordinary success. The paper is available everywhere in the city, in places of amusement, doctors' waiting rooms, restaurants, stores of all kinds, offices of merchants, bankers and lawyers, in hospitals and in private houses, for the use of aged people to whom reading is fatiguing. Although the paper speaks all day, the information is carefully classified, and each subscriber has a programme, by which he can tell what kind of news is about to be given at any period of the day. At half past eight the day's work is begun by the reading, in a clear, sonorous voice, quite free from the nasal twang of many telephoues, of the telegrams received in the night from America and the different parts of Europe. At a quarter to nine follows the daily calendar with metropolitan news and the list of strangers that have arrived in the city up to the previous night. Then comes official news, contents of the official gazette, etc., and at specified hours are heard in turn reports on the opening of the stock and corn exchanges, local and ecclesiastical news, theatricals, art and science notices. From a quarter past eleven to half past eleven information is given on foreign, provincial and sporting matters, and then to a quarter to twelve reports arrive from the Vienna stock and corn exchange, with all sorts of military, court and political items. Early in the afternoon, when the sitting of the Reichstag begins, the parliamentary report is supplied every ten minutes. The office is in telephonic communication with the Reichstag, and it often happens that important speeches from ministers and members are known to the public while the speaker is still addressing the house. A short summary of all important items is given at noon and again in the evening for those who may have missed auy of them. Towards evening, when news is growing scarce, the subscribers are entertained with vocal and instrumental concerts, quartettes and solos, the latter being given by the most talented artists of the capital. Literary articles are often spoken into the telephone by the authors themselves. All this is given to the subscriber for one penny a day, and both wire and apparatus are conveyed to his house free of expense. There are 6000 subscribers. The organization of the staff resembles that of any other big paper. Ten men with strong voices and clear articulation act as speakers and take their turn in shifts of two at a time. When any important event is about to be read, a shrill warning blast is sounded.

Mechanical Progress.

A SUCCESSFUL PROCESS for coloring iron and steel a dead black depends upon the employment of a particular description of fluid, the formula for which is as follows: One part bismuth chloride, six parts hydrochloric acid, five parts alcohol and fifty parts water, mixed thoroughly. The article to be treated being first made clean in every respect and free from grease, the preparation is applied with a swab or brush, or the object may be dipped into it, the liquid being allowed to dry on the metal and the latter then placed in boiling water and the temperature maintained for half an hour. If the color is not so dark as may be desired, the operation is repeated, and after obtaining the desired degree of color the latter is fixed as well as improved generally by placing for a few moments in a bath of boiling oil and heating the object until the oil is completely driven off.

OXALIC ACID is now derived from sawdust. A familiar process is that in which the nitric acid and sugar are boiled for some time, then evaporated to dryness, the oxalic acid thus formed being purified by crystallization from water. A cheaper material than sugar is sawdust, an alkali being employed instead of an acid, as well as at a higher temperature. The operation is conducted in an iron vessel of proper size and shape, and either caustic soda or potash is employed, the yield beiug greater with the latter.

THE oldest industry in Great Britain—older it could hardly be, for its history has been traced back to the prehistoric Stone age—is being carried on at a village of Brandon, on the border of Norfolk and Suffolk, and is reported to be in a flourishing condition. It is a manufactory of gun and tinder box flints. The work is done in little sheds, often at the back of town-folks' cottages. It will naturally be asked, "Who wants tinder box flints and gun flints in these days of phosphorus matches aud Martini-Henrys?" The answer to the first question is that there is a good trade in tinder box flints with Spain and Italy, where the tinder box still keeps its ground in every rural district. Travelers in uncivilized regions moreover, find flint and steel more trustworthy than matches, which are useless after they have absorbed moisture. Gun flints, on the other hand, go mostly to the wild parts of Africa, where our old friend "Brown Bess," sold by auction long ago for what flint muskets would fetch, has found, it seems, her last refuge.—London News.

A DEVICE has lately been put on the market which is claimed to be a great improvement in the way of pulleys. The new pulley obviates the necessity of cutting keyways on the boss of the pulley or on the shafting, it being arranged to automatically fix itself on the shaft. In the new pulley the boss is hollowed out at one part, the bottom of the recess being semi-circular in form, eccentrically to the shaft. A steel pin is placed in this recess, and, by reason of the eccentricity of the latter, when the belt is given a slight movement the pin becomes tightly wedged, thus automatically fixing the pulley. Several advantages are claimed for the new pulley, which is stated to be in successful operation at several works in France.

SOME blacksmiths seem to think that nothing will answer for welding purposes for use as a flux except borax. This is a mistake; there is a certain flux for each metal which works better than any other flux for that particular metal. Some fluxes, however, as is the case with borax, seem to work well with a variety of metals, particularly with iron, steel, copper, lead, tin, zinc, etc. Borax is a very good flux for steel, but ordinary lime will answer equally as well. It may be stated that lime is the natural flux for steel just as fine sand (silex) is the natural flux for iron; for copper, sal ammoniac is the best flux, while for lead, tallow fills the bill.—The Tradesman.

THE failure of a grate bar is due mainly to two causes, warping and burning off at ends. To overcome warping, the bar should be made with the least amount of metal, arranged to give the required strength. Water should also be kept in the ash pit. To prevent the bar from burning off at the end it should have openings for air at the end the same as in any other part of the bar, and an open bearing bar should be used instead of a solid plate, and should be set back from end of bars so as to allow the end of the grate bar to admit air freely.

IN the Danbury, Conn., gas works are a number of very large gas engines used to generate electricity. Recently a large number of tests have been made to determine the actual amount of power being developed and the gas consumed. It was found that the average indicated horse power was 95.29, the average brake power being 83.3, thus giving an efficiency of 87 per cent. This is a much better showing than some engineers think the engines can make.

Electrical Progress.

Electrical Heating Efficiency.

The following by H. Ward Leonard gives figures that are often asked for, in a condensed and easily understood form:

UNITS.	EQUIVALENT VALUE IN OTHER UNITS.
1 K. W. Hour=	1,000 Watt hours. 1.34 H. P. hours. 2,365,400 foot pounds. 3,600,000 joules. 3.440 heat units. 366,848 Kg. m. 0.229 lbs. coal oxidized with perfect efficiency. 3 lbs. water evaporated at 212 deg. F. 22.9 lbs. water raised from 62 deg. to 212 deg. F. 8 cents at usual rates for electric heating.
1 H. P. Hour=	0.746 K. W. hour. 1,980,000 foot pounds. 2,580 heat units. 273,740 Kg. m. 0.172 lbs. coal oxidized with perfect efficiency. 2.25 lbs. water evaporated at 212 deg. F. 17.2 lbs. water raised from 62 deg. to 212 deg. F. 6 cents at usual rates for electric heating.
1 K. W.=	1,000 Watts. 1.34 H. P. 2,656,400 foot pounds per hour. 4,424 foot pounds per min. 73.73 foot pounds per sec. 3,440 heat units per hour. 573 heat units per min. 9.55 heat units per sec. 0.229 lbs. coal oxidized per hour. 3 lbs. of water evaporated per hour at 212 deg. F.
1 H. P.=	746 Watts. 0.746 K. W. 33,000 foot pounds per min. 550 pounds per sec. 2,580 heat units per hour. 43 heat units per min. 0.71 heat units per sec. 0.172 lb. coal oxidized per hour. 2.25 lbs. water evaporated per hour at 212 deg. F.
1 Joule=	1 Watt second. 0.00000278 K. W. hour. 0.102 Kg. m. 0.00094 heat unit. 0.73 foot pound.
1 Foot Pound=	1.36 joules. 0.1383 Kg. m. 0.000000377 K. W. hour. 0.000291 heat unit. 0.00000035 H. P. hour.
1 Watt=	1 joule per sec. 0.00134 H. P. 0.001 K. W. 3.44 heat units per hour. 0.73 foot pound per sec. 0.003 lb. of water evaporated per hour. 44.24 foot pounds per min.
1 Watt per. sq. in.=	8.26 thermal units per square foot per min. 120 deg. F. above surrounding air (japanned cast iron surface). 66 deg. C. above surrounding air (japanned cast iron surface).
1 Heat Unit=	1,048 Watt seconds. 772 foot pounds. 0.252 calorie (Kg.-d.). 108 Kg. m. 0.00291 K. W. hour. 0.000388 H. P. hour. 0.0000667 lb. coal oxidized. 0.00087 lb. water evaporated at 212 deg. F.
1 Heat Unit per sq. ft. per min.=	0.021 Watt per sq. ft. 0.0174 K. W. 0.0232 H. P.
1 Kg. m.=	7.23 foot pounds. 0.00000366 H. P. hour. 0.00000272 K. W. hour. 0.0092 heat unit.
1 lb. Bituminous coal oxidized with perfect efficiency.	15,000 heat units. 0.98 lb. anthracite coal oxidized. 2.1 lbs. dry wood oxidized. 15 cubic feet illuminating gas. 4.37 K. W. hours (theoretical value). 5.81 H. P. hours (theoretical value). 11,590,000 foot pounds (theoretical value). 13.1 lbs. water evaporated at 212 deg. F.
	0.33 K. W. hour. 0.44 H. P. hour. 1,148 heat units. 124,200 Kg. m. 1,210,000 joules. 887,800 foot pounds. 0.076 lb. coal oxidized.

Cum Grano Salis.

The New York *Tribune* tells a fairy story which is good enough to be true regarding the wonderful uses of the phonograph. According to the veracious journal founded by Horace Greeley, a pump works had put up one of their large pumps for the Ricks Water Company at the Elk River pumping station in California. The pump was in constant use for some

years and the makers heard no complaint until a few weeks ago, when they received a novel communication from H. L. Ricks, the manager of the pumping station. There was no doubt in the minds of those at the station who were best acquainted with the mechanism that something was wrong with the pump, but they were unable to fix on the defect; and as the dismemberment of the pump would involve much loss of time, and as a visit by an expert would mean a considerable expense, the phonograph was resorted to. The manager spoke into the receiver, describing the symptoms of the ailing pump, and further, to indicate the case, he placed the receiver so that the pulsations of the pump would be recorded on the cylinder. Just as a physician listens to the action of the heart or lungs in the human body by means of a stethoscope, so the pump doctor listened by means of a phonograph to the throbs and pulsations of the pump thousands of miles away, and was enabled by that means to diagnose the disease. A *Tribune* reporter listened to the strange communication at the New York office of the Knowles Company. The voice of the Californian is heard first giving in a clear, precise and distinct way the symptoms of the pump, and then he asks the listener to pay attention to the pump's action. Then one hears the h-r-r-r-bang! h-r-r-r-bang! of the pump and an occasional wheezing sound which might be made by escaping steam.

The engineer to whom the phonograph was submitted said that the whole record was so perfect and the speaking so plain that he felt tempted sometimes to interrupt and ask additional questions.

The experiment proved absolutely successful, and by means of the roll the disease was diagnosed. The proper remedy was suggested, and the pump is running once more "good as new."

The *Tribune* tells the story in a serious way and appears to credit it as the narration of an actual fact.

Practical Information.

In times past it has been the custom of many owners of gold mines in this State to run all their ore through a mill, regardless of its character or value. In many cases no assays are made of the rock, and its value is determined only by what is caught on the plates and concentrators. It is a well known fact that frequently high grade or rebellious ores have, by such treatment, yielded only a small fraction of their values, thus involving large losses to their owners. It is noteworthy, however, that miners are realizing the fact that, notwithstanding the higher cost of treatment, and freight, it is more profitable, on account of the high percentage of gold obtained, to sort out and ship such ores to the nearest smelter for treatment. The Selby Smelting & Lead Co., whose works are located at Vallejo Junction, have recently been making extensive improvements in their plant, thereby increasing their capacity and reducing cost of smelting, and are now offering special inducements to shippers of gold ores. Their rates will now allow shipment of those ores which previously could only be treated at the mine, or left on the dump. In this regard it is suggested that mine owners in general might find it advantageous to communicate with the Selby Co., and obtain their rates.

A CHEAP belt is always costly and will never fail to give trouble, while a first-class short-lap belt will run for a long time without any signs of crankiness. The grain or hair side of the belt is the weakest; it cracks more readily than the flesh side. It should be placed next to the pulleys for the above reasons and because it clings more tenaciously to the pulleys, due to its smooth, close surface.

CROSSED belts give the best results in driving, because of the increase in the arc of contact. The belt rubbing in passing at the cross would take from this efficiency, but with pulleys of equal, or ucarly equal, diameter this friction really amounts to nothing. Where there is considerable difference in the size of driver and driven pulley, it may make considerable difference.

NEW FACTS in welding by pressure at temperatures below the melting points of the metals have been reported by the Royal Society of Belgium. Pressed together by hand-screws, cylinders of gold, lead and tin were well united in a heat of 200 to 400 degrees for three to twelve hours, bismuth and autimouy less perfectly so. The more crystalline the metal the less was the softening.

WANTED!

A PRACTICAL PLACER MINER,

Capable of taking charge of hydraulic plant.

Address, stating salary expected, TEMPLE BAR, Kingman, Arizona.

ANCHOR COAL AND DEVELOPMENT COMPANY.

NOTICE OF ANNUAL MEETINO.

The annual meeting of the shareholders of the Anchor Coal and Development Company will be held at the office of the Company, No. 632 Market Street, Room 5, San Francisco, California, on MONDAY, the 21st day of October, 1895, at 11 o'clock A. M., for the purpose of electing a Board of Directors for the ensuing year and the transaction of such other business as may come before the meeting. E. D. FARISH, Secretary.

OFFICE.

The shareholders of the Anchor Coal and Development Company will please take notice that the office of the said Company has been removed from 19 Montgomery Street to 632 Market Street, Room 5, as per resolution of the Board of Directors.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from E. C. Hard, in the Terry Hill Mine, near Spanish Ranch, Plumas Co., to impound tailings in an old pit; from Will De Vinny, in the Lone Star Placer Mine, Cromberg, Plumas Co., to impound tailings in Jackson Creek; from Charles Jordan, in the Poor Man's Hydraulic Mine, near Placerville, El Dorado Co., to impound tailings in Taylor's Ravine; and from L. Canato and G. Oneto, in the Eagle Mining Claim, on Dry Creek, Amador Co., to impound tailings below the mine, gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Oct. 14, 1895, at 1:30 P. M.

1000 FEET FOR $1000.

This can be done with the

CHAMPION DIAMOND CORE DRILL

That we own and desire to sell, having completed prospecting our mine. The plant is complete in every detail, including every tool and diamonds, and is practically new. The 1¼-inch core can be taken out 1000 feet in depth at any angle at the rate of 20 to 50 feet a day. Why sink shafts, drive drifts and fight water to know your mine?

Mining Summary.

CALIFORNIA.

Amador.

CENTRAL EUREKA.—C. W. Randell of this city has secured an option on the Summit mine, incorporated under the name of the Central Eureka. W. R. Thomas is reopening the mine. Nearly all the former improvements have been destroyed and work has been begun on the 700-foot shaft. Mr. Thomas believes that at the depth of 100 feet he will encounter the old shaft, in good condition and the timbers sound.

THE KENNEDY.—Amador's largest gold producer reports pay rock found in the east crosscut on the 1950-foot level. Ground in that vicinity has been acquired and indications favor an increase in the output.

Butte.

THE BANNER GOLD MINE.—In the London *Mining Journal* of Sept. 21 in as account of the general meeting of the Banner gold mine. The Chairman said:—The meeting, as you all know, is held to comply with the law, which demands that the shareholders shall be called together within four months of the formation of any company. Very little news, as a rule, is put before the shareholders at such meetings, but I propose to give you a brief description of the property we own, and to tell you what the policy is that your directors propose to pursue. This course will, I think, be appreciated; because, owing to the fact that all the sbares were taken up privately, there was no need for the issue of a prospectus. Our mines are situated in one of the greatest gold-producing countries in the world, and everybody knows what enormous wealth has been extracted from California. Writers appear to differ as to whether Calfornia or South Africa carried the palm for gold production last year; but I think I am right in saying that no gold mine exists in South Africa which is producing anything approaching the yield of the great Utica mine, in California, which, I am informed, pays its lucky owners a monthly profit of £170,000. Still, there can be no doubt that California will have to do her utmost if she wishes to keep pace with South Africa. Now, I do not want anybody to infer from what I have said that I consider all gold mines in California are rich, or even good, merely because they are situated in that great gold-producing country. We all know there are failures there as everywhere else, and tbat great discrimination is needed before anyone embarks his capital in mining shares. Before I accepted the position I occupy in this company I took pains to thoroughly satisfy myself tbat the mines it owns, and its prospects, were exceptionally good. The company possesses two mines—the Banner and the Amosky—which adjoin each other, but it is to the former of these that my remarks apply, because until further development work is done upon the latter I can only tell you that the Amosky ledge has been found to be about 14 or 15 feet wide, carrying low-grade ore. It is not the intention of your directors to work upon this ledge at present, but to devote all energy to the Banner, as I shall shortly explain to you.

The mine is situated on the south-east side of Table mountain, about four miles from the terminus of the California Northern Railroad, and about five hours' run from San Francisco. We have two reports upon it, one of them being from an expert who for ability and integrity ranks, I believe, second to none. I refer to Mr. J. B. Low, of San Francisco, who, I understand, has for many years been adviser in mining matters to Mr. John W. Mackay and other mining magnates of America. I mention this because Mr. Low's report carries very great weight with us, and it is as well that I should explain the reason. The mine has had a remarkable history which Mr. Low, in his report, sums up both concisely and clearly. He says:—"The mine was located and worked by Messrs. McSmith and Sparks about 1857, and is reported to have produced $60,000 from rock, the greater quantity of which was worked by arrastras. At or immediately below the 200 level, the mine, owing to poor and insufficient timbering, caved badly, and was allowed to lie idle through a misconception of the extent of this cave. After considerable desultory efforts to open up the mine by different parties, a New York company purchased the property, and carried the shaft to the 300 level, at which point further work on the Banner was suspended, owing to the broken country encountered, and to an erroneous opinion as to the value of the Amosky vein to the east. The company after carrying out some very expensive and useless development work on the Amosky, suspended, and the mine was added to those, the reopening of which by competent men is greatly increasing the gold production of this State."

He then goes on to show what has been done since the property passed into the hands of those now interested in it, and says:—"The mine passed into your possession, and the shaft was carried below the disturbed strata to the 500 level, where a crosscut was driven west. After considerable exploration work on this level the true fissure was struck, and a rich ore body encountered in it a short distance north of the crosscut. On the 600 level the fissure is found even more perfect than it is on the 500 level, the walls carrying a heavy graphite 'putty' gouge, the vein matter filling the fissure and the blue laminated ribbon quartz showing up well: in fact, all favorable signs are present, and on this level the fissure has widened out to about eight feet between walls, an increase of about four feet in width as compared with the 300 level. The continuance in depth of such a fissure in this formation admits of no doubt, and the development of the mine shows that pay ore extends throughout the shoot from the surface to the lowest level, on the floor of which the richest rock yet taken out of the mine is found. As I have stated, the 600 level is very near the unbroken formation, and sinking will find a perfect pay-shoot, the upper and broken apex of which produced under your management $65,000. The thorough opening of the mine should be pushed by sinking the main shaft to the 1000 level, opening the fissure by crosscuts, and by steady exploration on the 500 level. I have known the Banner mine for many years, baving visited it first at the time it was being worked by its original owners; and even at that distant day I was impressed with the probability of the permanence and richness of the mine. The ledge is carried in as promising a fissure as I ever saw, and there is no doubt in my mind that it contains rich ore shoots to the south and north of the one now being worked, and that the northwest feeders encountered on the 500 and 600 levels come to the fissure from a rich and unknown ledge in that direction.

"In my judgement, from the known dip of the diabase forming the western boundary of the slate, a ledge will be found on the contact of the slate and diabase, and the mine will then take rank among the foremost producers of this State. In an experience of 46 years I have seldom been upon a more perfectly-equipped mine than the Banner; all the works are evidence of the thoroughness, skill, and economy of the management. The electric machinery runs with absolute precision, giving the very best results, and I note that arrangements are made so that steam can be coupled on should the electric power fail. I expected to find a well-equipped, well-opened, and well-managed property, but the conditions at Banner far exceed my expectations, so much so that I cannot advance a single suggestion that would in any way add to the good of the mine. With the admirable system of maps and surveys now in your possession, the future development of the mine will be an easy task. You own a most valuable property, and no time should be lost in opening it up in depth." When such an authority as Mr. Low says that we have struck the true fissure, that the continuance in depth of this fissure admits of no doubt, that the greater the depth the richer the ore, and that immediately we have sunk 300 feet or 400 feet deeper, and reach the point where the slate and the diabase come into contact, the mine will rank among the foremost gold producers in California—when he says all tbis, and in no equivocal manner, I feel that we are justified in fully believing, as we do, that we have got hold of one of California's bonanzas.

For upwards of three years development work has been pushed ahead vigorously at a cost approximating £50,000, and during this development work the ore that has been extracted and milled has yielded, up to the end of last month, nearly $80,000, the average having been £7 per ton, which everyone will admit is a remarkably good indication of what we shall find when the workings are at a deeper level. What we now propose to do is to follow the recommendation of both Mr. Low and our mine manager, Mr. W. H. Rodda, by sinking as quickly as possible to the 1000 foot level, so as to tap the rich "mother lode" there; and we propose to provide at least thirty more stamps for handling tbe ore when we reach that point, as at present we have only ten stamps running. When this work has been accomplished we have every reason to hope that the dividends will be very large, and for this reason—during the development work I have referred to—the ore encountered yielded $35 per ton, and as its richness is found to increase in depth, we may fairly calculate on getting $50 rock at the 1000 foot level, if not before we reach that point, and then with forty stamps running, the profits would admit of more than 100 per cent per annum. I am aware that this sounds very big, but when we bear in mind that various assays taken from many parts of the mine during development work ranged from $142 to $1500 per ton, I do not think we are expecting too much when we estimate on $50 per ton on reaching tbe depth I have mentioned. Mr. Rodda's report entirely coincides with Mr. Low's, both of them being agreed that the mine should be carried to greater depth without delay, and large as is the amount of gold that has been taken from the mine—about $800,000—Mr. Rodda describes the fissure from which it was taken as "merely a mineral vent for the great mother lode existing below." Our object is to attack this mother lode as quickly as possible. Our entire plant is run by electricity, which, as compared with steam, effects a very great saving. In fuel alone we estimate we save over £2000 a year. The mine is, however, provided with steam-power also, which can be coupled on very quickly should it ever be needed. This morning the following cablegram was received from the mine:—"The shaft has reached the depth of 43 feet below 600 foot level. Winze is down 41 feet below 600 foot level. Work going ahead rapidly and well. Winze is in good ore, which continues to improve with depth. Mill has been running half-time on reserve ore. The mill battery plates look very well. Everything going on well." We consider that very good news.

In the absence of questions, the Chairman concluded the proceedings by expressing the hope that at the next meeting the directors would have a good report to give the shareholders, and also a good dividend.

Mariposa.

GENERAL NOTES. — *Miner:* McKenzie & Donohoe of the Virginia mine will put in additional machinery, the tunnel will be reopened and the shaft deepened.

J. Buttgenback, owner of the Tyro mine, is supervising the opening of the lower levels.

At the Merced Gold Mining Co's property forty men are at work on the Black Creek dam. As soon as the dam is finished the erection of their new mill will be commenced. The building to be erected will be large enough to contain 210 stamps but for the present but forty stamps will be put in position. The Tuolumne ditch to convey the water for mining purposes is at present at a standstill, as the final surveys have not yet been completed.

H. M. MacLymont of Fresno is at Coulterville to take a personal supervision of the mine. The present arrastra is found to be inadequate and a mill is to be built. A fine body of ore has been met with in the tunnel which is being run to connect with the shaft. Work in the tunnel is being pushed night and day and about ninety feet more will make the connection, which will drain the shaft and make an exit for the ore through the tunnel.

Philip Corcoran, who has a bond on the eight mines of Messrs. Lindsay, Downey and Martinez, located in the Flyaway section, is about to begin active operations.

Isaac Salhinger of the Red Banks Mining Company reports work in the mine is going abead with unabated energy. The drifts and raises are being pushed along to open up and uncover the ore bodies and new work is under way.

O. F. Paulsell of Gentry Gulch, who is interested with L. N. Wilson says the five-stamp mill will be there this week.

SALE OF THE SANTA ROSA.—The Santa Rosa mine has been sold by Cox, Roberts, Stockton and Beyfogle of Madera to Lane, Hayward & Co. Theodore Allen will be the superintendent. The mine is on Little Bear creek, seven miles north of the town of Mariposa. There is a 10-stamp mill on the property.

Kern.

AMALIE DISTRICT.—The Amalie Mining Co. has struck a new shoot of ruby silver on the 200-foot level.

The country is overrun with prospectors, and all the ground for miles around the first discovery is being thoroughly prospected. Under the rules of this district there must be ten feet of work done and all monuments upon each claim prior to recording. The ore is of a concentrating character, carrying considerable free gold. The leads are usually large, in some instances being from ten to thirty feet in width.

Nevada.

THE LA BELLE SOLD.—The La Belle quartz mine, in Willow Valley district, is sold to H. B. Tomkin of tbis city, who will put up machinery without delay and open the same in a systematic manner.

TO MINE THE RIVER BED.—The *Transcript* says it is the intention of the Electric Power Co., who are now installing an extensive plant on the South Yuba river, to mine the river bed next spring and summer. The large flume that is being put in will carry nearly all the water in the river during the dry season, and by diverting this water the river can be worked for about three miles. There are a number of long stretches that have not been worked in thirty years or more, and it is believed that the tailings will pay well the entire distance. In the neighborhood of a hundred men will be employed, and the river will be worked to bedrock. The company anticipate realizing a sufficient profit from this proposed venture to offset the cost of construction of the electric plant.

Placer.

THE PIONEER MINE.—The administrators of the estate of the late Jas. G. Fair bave made a return of the sale of the estate's half-interest in the Pioneer mining property. The sale of the entire property was made to J. M. Cox and S. F. Bickford for $151,250. From this was deducted $1244.65, the expense of the sale, leaving a balance of $150,000.35, of whicb latter sum $75,002.70 was paid to the Fair estate. The administrators have since paid out of the estate's share $2500 to J. M. Brazell as a commission for making the sale.

TAKES CARE OF ITSELF.—At the Lady Bedford mine, in eastern Placer, a two-stamp mill has been used for the past two years and pays the owners. This is, perhaps, about the only mill in the county that takes care of itself. The *Sentinel* says the owners of the mine do their own work, and while they are driving ahead their tunnel or getting out ore the little mill hammers away by itself. Before going home at night the ore bin is filled and the mill hammers away all night to perfection.

AT DUTCH FLAT.—*Sentinel:* E. Mallows has completed his eight-stamp mill at the Golden Shaft and next week Dutch Flat will hear the first stamp mill that its people have heard for many years. The mine is being put in shape and in a few days the work of taking out gravel will commence. At present Mr. Mallows has seven men at work.

Plumas.

GENERAL NOTES.—Retimbering of the Thistle shaft 400 feet deep has been completed.

The Squires Bros. are sinking shafts for some San Jose men, northeast of Gibsonville, to strike the extension of the Thistle shaft channel. A steam pump is being put in place and bedrock is expected about 300 feet from the surface.

Gould and Spencer, of Gibsonville, have taken out about $6000 from their hydraulic claim at Hopkins creek, and are preparing for another season's work.

It is thought about 600 feet more of tunnel will be needed to reach pay gravel in the Tabor drift.

Sacramento.

ASSOCIATION FORMED. — The Sacramento County Miners' Association was organized in Folsom last Monday with 131 charter members. James H. Burnham was elected president and James P. Cox secretary. Sixteen delegates were chosen to attend the Miners' Convention, which meets at Pioneer Hall in this city at 10 A. M., next Monday.

San Diego.

INTERESTS TRANSFERRED. — The interests of D. C. Lane and Col. Rhorer in the Gold King and Gold Queen mines, as well as in the Cincinnati Belle, and the stamp mill at Banner, have been bougbt by Gunol Bros. of Los Angeles. Work will soon commence on all three mines.

An option on the Ranchita mine has been secured by Senora Louisa Garfilas of the city of Mexico. The purchase price of the Ranchita is $15,000 and the sale will be closed at once if the report of the expert now there is favorable.

Sierra.

THE GOLDEN STAR.—*Messenger:* The Golden Star Mining Company, recently incorporated, have just started in to work. They have begun a tunnel to crosscut their small blanket ledge, out of which the Wilson Bros. last year took $1800 in a sbort time. C. M. Wilson, the general manager, when he reaches the blanket ledge will drift on it until he reaches the main ledge, which is some eight or ten feet wide.

NEVADA.

LINCOLN COUNTY.

A MINING SALE.—The De Lamar *Lode* says: The most important transfer of mining property that has been made in Ferguson district since the purchase of the Monitor-Jim Crow group of mines by Captain J. R. De Lamar, was that concluded by Frank Wilson last week. The purchase price is not definitely known, but tbe property changed hands at a big bargain. That purchased was all of A. W. Ellis' interest, which consisted of three-twelfths of the April Fool, one-third of tbe Jumbo, one-third of the Dablin, one-third of the Lookout, one-fifth of the Swifter and one-third of the Cliff No. 2.

OREGON.

LINN COUNTY.

THE LAWLER GOLD MINES.—W. B. Lawler, managing director of the Lawler Gold Mines, Limited, an English company developing gold mines in Linn county, says the sinking of a winze in the Red Bull mine has exposed an ore vein five feet in width, without sign of hanging or foot walls, the assay value of which is $47 per ton in gold, and also carrying some silver.

The forty-stamp mill building is under construction. The extensive work being done by this company has given an impetus to mining in Linn county, and a score or more of prospectors are out in the hills of the Santiam in quest of indications. Some weeks ago the New York *Banker*, referring to the mines now under control of the English company, stated that tbe property had been sold for $500,000, which is an error. The property is not for sale, but $500,000 has been subscribed in London as a working capital, which will be used to thoroughly prospect the several claims, provide the requisite machinery and meet the preliminary demands incident to the practical development of such an enterprise.

JOSEPHINE COUNTY.

Tidings: The Farmer's Flat mines, which were sold by Mrs. M. Miller to Portland parties during 1894, are in the hands of the sheriff. The sale will take place on October 28th, to satisfy a lien of $6700 and costs.

The Donaldson-Ficke mine in Bishop Creek district, owned by Gill, Briggs & Eggert, together with the mill, etc., will be sold on October 26th, to satisfy the liens of the laborers filed against it.

Simmons, Cameron & Co., of Waldo precinct, have invested in 2000 feet of new hydraulic pipe, and will operate their mines on a larger scale than ever next season.

A three-foot vein of rich ore has been struck in the Hammersly mine, on Jump-off-Joe, at a depth of 115 feet.

WASHINGTON.

Work on the Little Chief mine, in Sultan basin, will be resumed in the spring. The principal stockholders in the company were recently there. The mine, owing to bad management, was closed down some time since.

BRITISH COLUMBIA.

THE BLUE BELL.—About forty men are employed in the Blue Bell mine, the property of the Kootenai Mining and Smelting Company. The output is about 200 tons per day. A vein of copper ore in tbe same property, which on the surface was only a narrow stringer, at 15 feet was one foot wide, and at 135 feet is seven feet in width. The property is not a mine in the general acceptance of the term, but a mountain of ore, and is quarried out. One shot will dislodge forty or fifty tons and it costs only 78 cents a ton to mine and put into the concentrator at Pilot Bay, ten miles from the mine.

WAR EAGLE.—Up to October 1st, the War Eagle mine at Trail Creek bad shipped 7025 tons of ore. The shipments averaged $48.30 per ton. From this must be deducted $10.50 for freight and treatment, $2 per ton haulage to Trail, and $4 for mining, leaving a net profit of $31.30 per ton. A new tunnel is now being run in from below to tap the vein, which it is expected to reach in 1800 feet.

THE ALBERNI.—It is doubted whether the Alberni country in British Columbia is worthy of the boom which has been inaugurated. A gentleman who is in a position to know says: "There may be something there, but the fact of its nearness to Victoria and the knowledge that twenty years ago this district was known, and nothing having been done in all that time, leads to the conclusion that there is not much there."

At the Cinnabar mine, in British Columbia, retorting has begun, and on the 28th ultimo 250 flasks had been filled and a stock of empty flasks had come in. The owners expect to find a sale among the gold mines of the province for part of the product. These properties are located at Savona.

SLOCAN. — E. J. Mathews, representing Braden Bros., agents for the Omaha and Grant smelter, has secured a bond on the Ruby Silver from W. P. Russell of Spokane;

$7500, it is said, being the purchase price. The same parties have also secured a bond on the Ajax and Treasure Vault, on Noble Five mountain.

The Gallup group of mines, on Howser creek, have been bonded to W. J. McCune of Salt Lake City. Twenty thousand dollars is the reported figure. The deal was concluded on the 23d ultimo. A contract has been let to run 300 feet of tunnel. The President is the principal claim in the group.

ALASKA.

Sum Dum, Alaska, is said to show a very rich gold mine. The Bald Eagle vein runs from 4 to 12 feet in width. A thousand dollars a day is the reported profit that a five-stamp mill is turning out.

IDAHO.

THE POORMAN.—The new ten-stamp mill of the Poorman mine in Silver City, Idaho, is completed and in operation. With the mill is a tramway 8000 feet in length, which will bring the ores to the mill. The tramway has a 10 per cent grade.

UTAH.

THE MAMMOTH.—*Tribune:* The Mammoth Company in Tintic is fast paying off its debts, and is likely to soon be again in the list of dividend payers. The approach to the big cave is rapidly being timbered up, and when it is in shape to be worked in the superintendent tells the directors that, commencing with the month of October, the ore shipments will amount to $40,000 per month. Five cars of ore taken from the cave are now on the market, and careful samples made of the interior show an average value of 40 ounces silver, 35 per cent lead and $6 in gold per ton. The cave is about sixty feet high and forty wide, but its length has not been ascertained, as it pitches into the formation at an angle of about twenty degrees.

NEW INCORPORATION. — The Black Eagle Mining and Reduction Company has incorporated in Salt Lake City; capital stock $100,000. The property of the company, which is located between Rush valley and Doremus on the Union Pacific Railway, consists of the Black Eagle, Sutro and American No. 1 and 2, in Rush valley. The properties are accepted by the company for a price representing 80 per cent of the capital stock.

MONTANA.

The Daisy mine at Cook City was purchased recently by Aaron P. Bless of Saginaw, Mich. The property was bonded by Bless a year ago.

The Florence Mining Company of Neihart, Mont., recently declared a dividend.

IN TETON CO.—Gold bearing ore has been discovered in Teton county, Montana, on Burcb creek, about 15 miles from Dupuyer. It is thought that the surface ore will run $10 per ton. About fifty men have already gone to that section.

LIBBY CREEK DISTRICT.—The development work on the Silver Cable group in the Libby creek district, consists of 900 feet of tunnels and shafts. The product of this property is free milling gold, the concentrates of which will run $100 to the ton.

THE GREAT FALLS SMELTER.—The silver smelter at Great Falls will before many days be in operation once more. A large quantity of ore is now on hand and the amount is being increased by shipments from Barker, Neihart and other points. Upon the resumption of work 120 men will be employed and the pay roll will be about $20,000 per month.

SOUTH DAKOTA.

THE MOFFATT PROCESS.—*Times:* The Moffatt Mining and Milling Company are having a revolving dryer made at the Homestake shop in Lead. As soon as it is finished the oxidizing furnace now at the Golden Star mill and the dryer will be moved to Pluma and put in place in the building prepared for them. The new process will be in operation early in November. Members of the company are fully sanguine of the success of the method in the treatment of Black Hills ores.

COLORADO.

BRECKENRIDGE MINES.—Breckenridge, which in the early sixties was a prolific camp and has produced between $30,000,000 and $35,000,000 of gold, mostly from its extensive placer deposits, has a number of mines which are, as yet, less remarkable for the extent of their development than for the variety of their gold occurrence. At the head of the Blue river there are mines working on the contact between the crsytalline schists and the overlying Cambrian quartzite. The enrichment along the contact occurs in places where small veins come up through the schists, feeding the contact, which then becomes notably gold bearing along the strike of such veins and for a limited distance on the down slope of the bedding of the quartizite. The misunderstanding of this geological structure has led to these deposits being erroneously termed "gash veins," and the failure to appreciate the relations between the limited ore measures on the contact and the fissure veins which penetrate the underlying older rocks has caused much misdirected tunnel driving.

The gold belt, of which Farncomb hill is the richest point, extends northeastward through Gibson hill, Gold run and the lateral canons which feed the Swan river. Everywhere the ore deposits are associated with porphyry intrusions which, as sheets and dykes, traverse the quartzites, shales and limestones. Sometimes the ore of a mine is found to be part of a dyke or porphyry and then there is a tendency for the miner to consider the first smooth fracture plane he meets as a wall or limit of his workable vein. There is too little cross-cutting. Often while a contact plane with lime or shale may indeed (as in the Cashier mine) be the limit of his ore, he will find that on the other side there is no true well-defined limit, but that the porphyry simply becomes less mineralized, so that the limit of his pay ore is dependent more upon the cost of working than upon any structural distinction between what is ore and what is rock. In some of the mines (as in the Double Extension) the ore occurs in floors which conform to the bedding of the sedimentary rocks, and it will be found that extreme variations in the hardness and richness of the material are due to the alteration of beds of quartzite and intruded sheets of porphyry, both of which are intersected by the main line of fissuring, called the vein. In such cases the work of opening up the mine will be made much more intelligent and successful by a careful noting of the relation between the bedding of the country, the succession of porphyry intrusions and the main dyke whose course is across them. It is unfortunately not illegal to work mines without the keeping of proper maps founded on accurate surveys, but in default of such a regulation I would emphasize the the fact that the intelligent development of a mine in such a formation without such work is a mere groping in the dark, a sailing over unknown seas without a compass, and that ordinary business sense, apart from any scientific ideas, demands the use of maps and cross sections.

T. A. RICKARD, State Geologist.

October 1, 1895.

ARIZONA.

JONES-SWANSY CLAIMS.—At Briggs, in the Castle Creek mining district, are the Jones and Swansy mining claims, situated in Yavapai county, about 100 miles south of Jerome, the property of Hill and Nortoa, of Kaasas City. A tunnel is now being run through a body of ore which runs some in gold and carries from 18 to 20 per cent copper. The ore will be reduced at the mines, there being a large smelter on the grounds, which was put in some years ago by the Copperopolis Mining Company, and is now in good shape for working.

NEW SMELTER.—George O. Bradley, who was the designer of the copper plant works in Salt Lake City, is at Clifton to design a large four-stack smelter and refinery, to be erected by the Detroit Copper Company.

A GOOD SHOWING.—Arizona's contribution of gold, silver and copper during the last eighteen years, ending June 30, 1895, was of a total value of $113,739,128. The output last year was, gold $4,260,000; silver 1,750,000 ounces at 65 cents, $1,137,500, a decrease of $563,560 from the preceding year; copper 49,661,288 pounds, an increase of 1,390,798 pounds, value $6,207,611.

Coast Industrial Notes.

—The Sacramento Industrial Improvement Association has the Ostrander gun factory for Sacramento. The offer embraces concessions for the use of electricity from Folsom at low rates.

—Joseph H. Choate of New York and Senator Stewart of Nevada have been retained by the defense associations of the State to fight the Wright law when it comes up in the United States Supreme Court on appeal from Judge Ross' decision.

—The big blast at the Otay dam, San Diego, was exploded last Sunday afternoon. At 2 o'clock 30,000 pounds of powder were touched off. It was entirely successful. The face of the hill was shattered and enough rock dislodged to afford ample material to complete the dam.

—The Manufacturers' and Producers' Association is now a regularly incorporated body. H. T. Scott is president; Julian Sonntag, first vice-pres't; W. F. Bowers, second vice-pres't; M. J. Keller, third vice-pres't; L. R. Mead, secretary; F. H. Dingle, assistant secretary; A. Sharboro, treasurer.

—The Bakersfield Gaslight Company will put in a complete gas plant to cost $20,000, including engines, boilers, buildings, purifiers, etc. The present coal system furnishes twenty-candle gas. Wallsend coal from Australia is now used, costing $15 per ton at Bakersfield. By the new system Los Angeles oil will be used.

—Articles of incorporation have been filed at Cheyenne, Wyoming, for the California, Idaho and Montana Railroad Company, which proposes to construct and operate a railroad from Butte City, Mont., to San Francisco; capital stock, $30,000,000. Incorporators—M. Lipman, New York; T. Voorhees, Philadelphia; H. M. Dickey, Chicago, and Denver and Boise City parties.

—In the past six months five large steamships, each carrying over 2,000,000 feet of lumber, have sailed from Puget sound for Delagoa bay, South Africa. In addition they have taken miscellaneous cargoes of Washington manufactured products. Three of the five steamers have loaded at Tacoma, and the sixth one of the line, the Straits of Sunda, is this week loading 2,000,000 feet of lumber for Delagoa bay.

—The J. Hammond & Co. California Car Works are building 100 flat cars, 50 box cars, 3 water-tank cars, 1 hoarding car, 1 sleeping car and 3 track-laying cars for the San Francisco and San Joaquin Valley Railroad Company, 15 electric street railway cars for the Seattle Consolidated Street Railway Company of Seattle, Wash., and 155 electric street cars for the Market Street Railway Company of San Francisco.

—At a recent joint meeting of the Board of Prison Directors and the Bureau of Highways in Folsom, to examine bids for machinery for the rock-crushing plant, the Union Iron Works submitted five bids, two of which were for $19,250. The others were for $16,000, $18,000 and $15,500. The Pelton Water Wheel Company put in two bids, one for $16,000 and another for $16,450. The Risdon Iron Works submitted a bid of $7693, and the American Road Machine Company, a Pennsylvania firm, a bid of $11,630. The $15,500 bid of the Unioa Iron Works was accepted.

—The Los Angeles Oil Exchange has agreed to San Francisco propositions and a contract has been signed providing for a freight steamer to ply between San Pedro and San Francisco. Oil shipments will be made by rail from Los Angeles to San Pedro, but a pipe line will ultimately be built. The exchange guarantees sufficient oil to keep the vessel busy. There is a demand here for 1000 barrels daily. The contract will be three years.

—By damming Cedar river, Wash., and raising the level of the water in Swan lake twenty feet, the Cedar River Power Co., of Seattle, Wash., expects to generate sufficient electrical power to run all the Seattle and Tacoma machinery, light both cities, and, incidentally, supply water. The longest transmission is eighteen miles. The company's capital stock is $500,000. Incorporators—E. H. Ammidown, M. McMicken and T. A. Noble, of Seattle.

—A new coal field in Arizona is under exploration and development, in the Whetstone mountains, fifteen miles from the railroad. The ledge is twenty-five feet thick and five miles long. Eleven claims have been taken out along the vein. One shaft will be put down seventy feet deep, to tap the vein from below. The owners are R. R. Richardson, J. Woodrum and nine others. The Southern Pacific has expended considerable money at Solomonville exploring for coal.

—Dr. Chas. Van Orden, representing the South Yuba Canal Company, has asked the Sacramento Board of Supervisors for a franchise for the Central California Electric Company to enable it to bring electric power through the county to the city of Sacramento. He says they have from 1700 to 2000 horse power at this time which they desired to bring into the Capital City. The power-house is only twenty-nine miles from the State Capital. Their pole line now extends to Rocklin, twenty-one miles from Sacramento. The matter has been taken under advisement.

—The Pacific Transmission Co. has incorporated: capital stock, $3,000,000: object, to generate electricity and electric power, and their transmission to the county of Alameda, the cities of Stockton, San Jose and other cities and towns of the State. The Treadwells are credited with owning three-fifths of the stock. They are the owners of the Corral Hollow coal mines, the Alameda & San Joaquin Railway Co., and the stated intention is to put up an $800,000 electric plant at the mine, utilize the "slack," or waste coal, and generate 6400 H. P., build pottery and cement works and supply power to a region seventy-five miles round about. The scheme is a very comprehensive one. It is probable this power business may be a little overdone after awhile. It might be well to devote more attention to creating new or increased demand for power.

—It is now proposed to transmit electrical power from the Kern river to Los Angeles, there to be used for lighting and power purposes. The distance from the headworks near Kernville to Los Angeles is 108 miles. The power is to be carried by wire this entire distance. It is claimed that, even with the enormous expense incurred in the construction of the line, which will amount to about $1 a foot, power can be furnished there cheaper than it can be produced by coal or oil. Enormous capital is required for the construction of such a plant and line, and the men who are manipulating the financial end of the scheme will endeavor to float not less than $2,000,000. Surveys are being made for the canal, into which it is proposed to divert the waters of the Kern river. The canal is to be twelve miles long, with a fall of twenty feet to the mile. The proposed route of the line is to be over the Tehachapi mountains, through Antelope valley, near Elizabeth lake, through Soledad canyon, near Lang's station, approaching the city by way of San Fernando valley. The idea appears visionary, but nothing in these days is to be considered impracticable.

Publications Received.

"*Handbook of British Columbia Mining Laws*;" a very complete compendium of legal requirements for the working and ownership of quartz or placer claims in that province. Sold by J. H. Brownlee, Box 815, Victoria, B. C.; price 25 cents.

"*Year Book of the Society of Engineers, University of Minnesota, Minneapolis, Minn.*;" technical articles in engineering, metallurgy, railroading, electricity, etc.; 137 pp.; price 60 cents.

"*The Journal of the Franklin Institute for October*," containing an article on "Irrigation, with an example of its application to the arid region of western America," by A. B. Wyckoff; "Engineering Education and the State University," by W. S. Aldrich, University of West Virginia; "An account of the Gardiner Lyceum, the first trade school established in the United States," by J. H. Cooper; "Electro-Metallurgy as applied to Silver Refining and, incidentally, to other Metals," by Geo. Faunce, B. A. S., superintendent Pennsylvania Lead Co.; with the usual interesting "Notes and Comments."

"*Cantor Lectures on Recent American Methods and Appliances Employed in the Metallurgy of Copper, Lead, Gold and Silver*," by Jas. Douglas, delivered in London last April and May before the Society for the Encouragement of Arts, Manufactures and Commerce.

The "GOLD KING."

THE GOLD KING AMALGAMATOR

Has been tested, proven, endorsed and already adopted by many of the LEADING MINING MEN of the Coast, and is acknowledged to be

The Monarch of Gold Saving Devices.

For Stamp Mills, Beach or River Sands they are without a peer. The "GOLD KING" saves all the fine or float gold and flonred mercury.

The "GOLD KING" is superior to horizontal plates in every particular. The plates in the "GOLD KING" will not foul nor scour.

The "GOLD KING" accomplishes the two essentials in plate amalgamation, viz., repeated contact WITHOUT SCOURING and ignoring SPECIFIC GRAVITY.

No Gold So Fine that it Cannot Be Saved by the "Gold King."

The amalgam is under lock and key. They occupy but small space and each No. 1 machine is equivalent to 450 feet of horizontal plate.

NO STAMP MILL COMPLETE WITHOUT THEM. Will save their cost in from 30 to 90 days.

We invite all live mine owners and mill men to investigate. The "GOLD KING" is no experiment but a PROVEN SUCCESS.

Send for Catalogue, Price List and References. Manufactured by the

Midas Gold Saving Machinery Co.,

Office and Exhibition Rooms:

Miners, Attention!

OUR works at Shell Mound are now ready to demonstrate to owners of mining properties (in carload lots or less) the quick and cheap reduction of refractory ores, by the "Holland Patent Blow Pipe Furnace." Refractory gold and silver ores are made free milling. The furnace is constructed to save all volatiles, no values allowed to escape. Complete plants in sizes to handle 10 tons per day up, built at reasonable cost, in comparison to all other methods. We would be pleased to have you call or write.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WATER BANDAGE.—Benjamin F. Springsteen, San Francisco, Cal. No. 546,436. Dated September 17, 1895. The object of this invention is to provide a water-containing flexible vest, with means whereby the water is retained evenly in all compartments of the vest, and also to provide a means by which the water in any one or more of the compartments may be maintained at any desired temperature. It consists of a water-tight fabric adapted to surround the body of the patient, separable at the side and consisting of an inner and outer wall of flexible imperforate material, partitions or diaphragms extending in the direction of the length of the vest in parallel series and arranged on edge so that they may be connected directly with the inner and outer walls, to hold the same separated and to form independent water chambers. These diaphragms have openings made transversely, so that the chambers may be connected with each other, and pipes enter the space between the walls at different levels, and are connected with a heating coil, which is fixed in a furnace or apparatus, whereby the water may be heated and circulated through the vest. A spring-actuated safety valve is attached to the delivery pipe of the heater having a tension such that a slight increase of the pressure will open the valve and allow the water to escape, thus checking the circulation, or, if a sufficient quantity escapes, it will flow down and extinguish the lamp.

FLOWER PIN.—Edward E. Park, San Francisco, Cal., assignor of one-half to Joun W. Davis, of same place. No. 547,181. Dated Oct. 1, 1895. This invention relates to a device which is designed to secure flowers and boutonnieres to a garment, and for other purposes for which it may be useful. It consists of a slender flexible wire having one end sufficiently pointed so that it may be inserted through the stem or through the base of the flower, close up to the flower itself, and then bent so as to prevent its being pulled out. The wire is then wound around the stem as many times as may be desired and the opposite end has a yoke formed upon it of sufficient stiffness so that it can be hooked into the fabric and thus retain the flower in place. This wire serves to strengthen the stem and prevent its being broken, or if broken it takes the place of the stem and retains the flower in position.

DOOR BELLS.—Isaac E. Shaw, Cloverdale, Cal. No. 547,186. Dated Oct. 1, 1895. The object of this invention is to provide a bell with freely movable hammers, adapted to rebound immediately after striking the bell so as to leave the latter free to vibrate and produce a clear unimpeded tone. The bell or gong is suitably fixed upon a horizontal axis, and a slotted tube is arranged within it, supported independently of the ground, with the outer ends inclining upwardly from the center in each direction toward the interior periphery of the bell. Within this tube are two balls, adapted to roll in any direction from the center. A spring arm extends upwardly between the two balls, and by means of a cam and turning device this arm may be withdrawn to either side of its central position. When released it will return and strike the ball upon the opposite side and force the latter against the bell to produce a sound, the ball immediately recoiling and rolling back to the center by gravitation.

EXPANDING LATHE ARBOR.—John P. Simmons, San Francisco, Cal. No. 547,188. Dated Oct. 1, 1895. This invention relates to a lathe arbor or mandrel, and an expansible mechanism connected therewith, and adapted to receive and hold any articles, such as pulleys, etc., which are to be turned. It consists of a mandrel or arbor made cylindrical and of essentially the same size from end to end, longitudinal key-ways formed therein increasing in depth from one end to the other, keys or feathers fitting and slidable within the key-ways having head portions, the sides of which are channelled to form radial grooves and tongues, a non-rotary collar slidable longitudinally upon the mandrel having its inner portion slotted radially to form tongues, and grooves adapted to engage the radial grooved sides of the heads so that the keys are movable with the collar and are at the same time allowed a radial motion. A nut is adapted to be screwed upon the arbor, and has a supplemental flanged two-part ring screwed into one end, with a flange fitting a corresponding groove or channel in the collar so that the rotation of the nut will advance the collar and feathers or keys in either direction, a stop pin extending through the collar into one of the key-ways, so that its point will strike the bottom near the shallow end to prevent the collar from being removed from the mandrel.

LETTER AND MESSAGE RECEIVERS.—Isaac E. Shaw, Cloverdale, Cal. No. 547,187. Dated Oct. 1, 1895. This invention relates to a device for receiving letters and temporary written messages and information memoranda. It consists of a fixed box, having a hinge-door opening outwardly from the front, with a means for securing it in a closed position, guides and vertically moving tablets having information printed thereon and slidable in the guides upon the door; a drum journaled in elastic standards, adapted to receive a roll of paper; an opening in the door and a table sunken below said opening, over which table the paper passes from the containing roll; a second drum upon the opposite side of the opening and table upon which the paper is rolled after the message has been written; a pawl and ratchet-wheel, the shaft of which extends through the side of the box, with a knob upon the outside whereby it may be rotated in one direction, and a lug or stop which prevents its being rotated in the opposite direction whereby the message may be written upon the exposed part of the pad and then rolled upon the drum concealed within the case, where it will remain until removed by the proper person without being exposed to any one else. Any number of such messages may be written upon the exposed surface of the pad, each one being in turn coiled upon the concealed drum. The illustration which accompanies this gives a good idea of the appearance of the device as it is constructed in readiness to be fixed upon an office door or other convenient point.

New Machine Works.

As an evidence of the improved condition of business, new enterprises are springing up in the city almost daily. One of the latest of these is the new machine shop just started by A. J. Van Drake at 143 First street. After an absence of more than a year, Mr. Van Drake returns to his old field of labor—fine machine work—wherein he has worked with success for so many years. Among machinery workers in the city, and over the coast generally, Mr. Van Drake is known as one of the most skilled men in his line. His new works are complete, with every modern appliance for turning out fine work quickly, including a Brown & Sharpe gear cutter of the latest pattern and large capacity—the only one of the kind in the city. This thorough equipment, supplemented by experienced and skillful assistants, will enable the new shop to sustain the reputation so long enjoyed by the old and to meet the increasing demands of the better times. *

Delegates, Attention!

There will be found on another page of the PRESS a general invitation to delegates to the Miners' Convention and all mining men, issued by the National Base Ore Reduction Company, to visit its works, near Shell Mound, Oakland, and investigate its new and cheap process for handling all refractory ores. Mr. A. J. Robinson, the general manager, will be pleased to see those who are interested, at the company's principal office, room 170, Crocker building. *

The Improved Huntington Roller Mill.

Those interested in working ores who are not already familiar with the above mill will benefit themselves by becoming acquainted with its merits at an early day. The cut of the improved mill to be seen elsewhere in the PRESS gives a very good idea of the mechanical principle involved. *

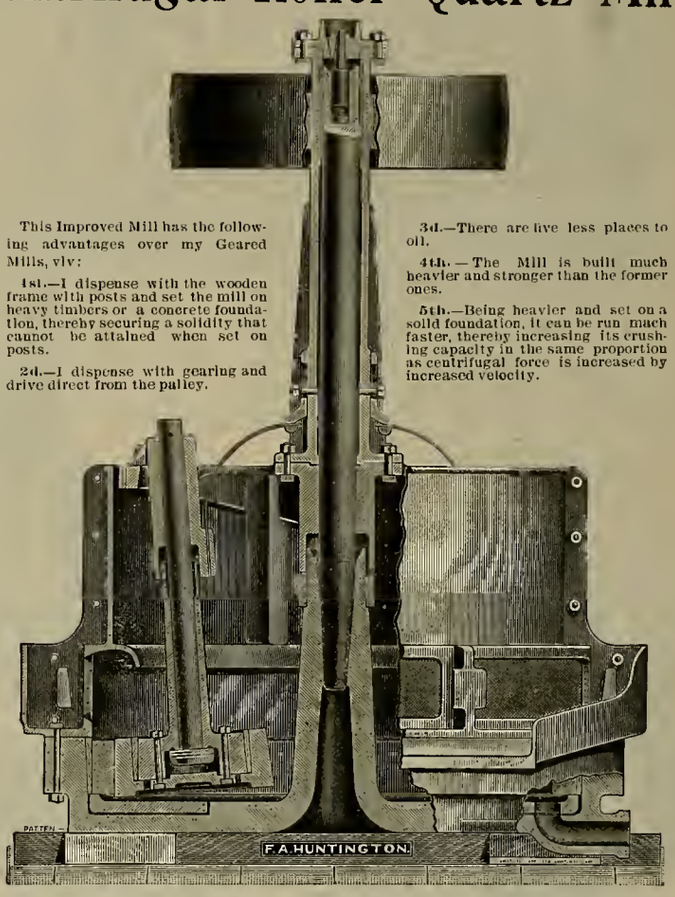
The Krogh Manufacturing Co.

The attention of mining men is called to the advertisement of this well known manufacturing company, to be found on another page. The Krogh pumps and mine hoists are in extensive use and are well worth the close investigation of visiting miners at this time. *

Electricity for Mines.

The utility of electrical mining apparatus is now generally recognized in California, as well as elsewhere, and some of the leading mines of the State are equipped with complete electrical plants, furnishing light and power, cleanly, efficiently and economically. Those interested in this important matter are invited to call at the headquarters of the Electrical Engineering Co., 34 and 36 Main street, where electric power apparatus for all departments of mining work is made a specialty. *

Save the Gold? Yes!



The present is a good time for practical miners to look into the merits of the new "Gold King" amalgamator. The works are at 114 First street, where every facility is afforded for a thorough investigation of what is claimed to be the best gold-saving device yet invented. Mr. A. C. Rumble, general manager for the Midas Gold Saving Machinery Co., will explain the amalgamator to those who may call. The company's announcement will be seen on another page. *

Wire Rope.

The old house of John A. Roebling's Sons Co. at 25 and 27 Fremont street, whose business announcement appears on another page of the PRESS, are prepared to meet every requirement of the mining interests for iron, steel and copper wire for tramway, hoisting, electrical or any other purpose. Get their catalogue. *

F. A. HUNTINGTON'S NEW IMPROVED

Centrifugal Roller Quartz Mill.

This Improved Mill has the following advantages over my Geared Mills, viz:

1st.—I dispense with the wooden frame with posts and set the mill on heavy timbers or a concrete foundation, thereby securing a solidity that cannot be attained when set on posts.

2d.—I dispense with gearing and drive direct from the pulley.

3d.—There are five less places to oil.

4th.—The Mill is built much heavier and stronger than the former ones.

5th.—Being heavier and set on a solid foundation, it can be run much faster, thereby increasing its crushing capacity in the same proportion as centrifugal force is increased by increased velocity.

Manufactured by F. A. HUNTINGTON,

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully
E. L. BALLOU, Propr. Ballou Reduction Works.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 10. 1895.

The appreciation in silver is the feature of the week: from 59⅞ to 68¼ is a most notable advance. A New York dispatch says it is due to silver accumulation at London, preparatory to another issue of honds hy the Chinese Government in settlement of the indemnity to Japan. For months London has heen accumulating silver. The production in the United States has not increased, while that of Mexico has fallen off.

The New York *Financial Record* of the 3rd inst. says: "There has been so much howling against silver that some people have all hut made themselves think it is valueless, hut there is a big, world-wide demand for it that will soon set it starting up toward a dollar an ounce. Silver to-day is the hest and safest investment in the market."

There is a general upward movement in all the metals.

Mining Share Market.

SAN FRANCISCO, October 10, 1895.

The market hung around the low prices published in last week's issue up to Tuesday afternoon, when there was stronger buying which caused a slight advance along the line. Prices were not only maintained on Wednesday, but still hetter figures reached for shares in the north end, which created a firmer feeling in hoth the middle and Gold Hill groups; even Alta and Bodie showed a slight improvement. There is no denying that during the two weeks' depression there was a weeding out of weak holders, which brought the holdings of commission brokers down to a low point. Not only did margin traders sell, hut quite a number of cash holders let go under the scare produced hy the low prices and the market looking as if it would go to pieces any minute. It is asserted hy those who should koow, that the manipulators gained quite a line of shares; this heing the case, it is only reasonahle to expect higher prices before another hig decline. While at this writing it looks as if shares from one end of the lode to the other will sell at hetter figures, yet it should not create surprise if those in the Gold Hill group of mines scored the highest percentage. This advance will prohahly he led hy Confidence, Challenge and perhaps Yellow Jacket. In the middle shares it looks as if Potosi will he the most active, while in the north end Ophir, Mexican, Union and Sierra Nevada are liahle to show the hest gains. This opinion is hased largely on the way in which the shares in these mines have been handled lately and also on the work that is heing done in them. Of course the manipulations can he changed and also the promising work he turned or else stopped, so that it is hest to he prepared for the uexpected. Until larger moneyed men openly come to the frout and take charge of the market, which they will not do unless there is a very much hetter showing in the mines than is now made public, dealings in shares are not a safe proposition, except for turos. No assessments were levied the past week, hut several are looked for hefore long. The market opened this morning with a fairly firm tone, hut inactive.

News from the Comstock mines is such as to warrant hetter prices, on a gamhling hasis, than now rule, hut for an investment they are fully high enough. The work under way in several may run into quite a hody of ore, which makes them a gamhle; still, results of the past two or more years are not such as to induce investment, buying on a theoretical proposition. In Sierra Nevada, Union, Mexican and Ophir the work is more largely of an exploiting character than for some time past, and it is in the direction where experienced miners look for good results. In Con. Virginia they are opening up quite a hlock of ground ahove the 1100-foot level for exploiting. There are differeot opinions expressed hy mining men as to what will he found. In Best & Belcher and Gould & Curry the work continues to he largely of a dead character, preparatory for more active work later on. In Hale & Norcross they continue to extract each week a few tons of ore while following up several streaks of ore. Savage is milling some accumulated ore. The work in the mine is unimportant. Potosi is milling ore. There was extracted during the past week over 260 tons, assaying a little above $30 a ton. The work in this mine does not attract any more attention than do its shares. Bulliou continues work in the west drift. In Alpha fair progress is heing made in the west drift. It will prohahly take several weeks at the present rate hefore the west lode is struck. The ground in the Cou. Imperial drift is changiug for the hetter. Experienced miners are watching this drift with considerahle interest. They say it will strike the west lode found in Confidence and Challenge. Private advices report that a lateral drift run from the ore found in the Confidence drift, run from the upraise from its surface tunnel level, is in Challenge ground. It is also stated that in striking the lode rich ore was at times struck. No official advices have heen received of this. The Confidence letter states that they extracted 16 tons of ore at that point, and that the drift from the surface tunnel level had heen extended 175 feet, when it passed through old stopes. It also stated that the ore found ahove would he struck ahout 25 feet further west. This shows considerahle of a westward dip of the lode. Evidently the old stopes passed through marks the taking out of ore at some former period, hut which was not reported, or, if reported, was done in such a way as to he misleading. The work in the Yellow Jacket is said to be of an interesting character, hut no official information is allowed to leak out. In Crown Point ore extracting and working to the west are still the order. Belcher and Seg. Belcher are running a joint west drift. In Overman the work is of a procrastinating character. In Alta a slight improvement is reported. Still hetter results are looked for as the work is pushed. From the Bodies the same old stereotyped reports come to hand. If silver continues to advauce, shares in the Tuscarora, Candelaria aud Quijotoa mines ought to come in for more attention.

On the Brunswick lode nearly forty men are engaged in pushing the work preparatory for more active exploiting in the grounds owned hy the Comstock mines. It will take some time after drifting for the ore hefore results can be known. In Occidental the work is largely of an exploiting character. There are those who helieve that something of value will yet he found.

Assessment Notice.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the first (1st) day of October, 1895, an assessment (No. 20) of Ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fourth (4th) day of November, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the twenty-fifth (25th) day of November, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

And in accordance with law and an order of the Board of Directors made on the 5th day of July, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 12, Rotunda Mills Building, San Francisco, California, on WEDNESDAY, the 4th day of September, 1895, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on September 4th, 1895, the above sale is postponed to FRIDAY, the 4th day of October, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, Cal.

POSTPONEMENT.

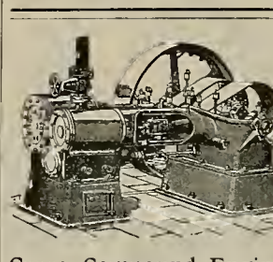
By order of the Board of Directors at the regular monthly meeting held at the office of the company on October 3d, 1895, the above sale is postponed to SATURDAY, the 2d day of November, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

DELINQUENT SALE NOTICE.

SONORA EXTENDED MINING CORPORATION.—Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.



Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 23d day of August, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Cert.	No. Shares.	Amt.
R. Risdon	77	1,170	$ 29 25
R. Risdon	100	48	1 20

The Oriental Gas Engine

IS THE BEST because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators.

By P. M. RANDALL.

This work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is specially applicable to the Pacific Coast.

TABLE OF CONTENTS.

The following brief abstract of the contents will give an idea of the branches of the subject treated: General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulæ Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulæ and Rules; Flow of Water Through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow Through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Full per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels, Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price $2.00, postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

69 First Street, PORTLAND, OR.

MANUFACTURERS OF

Stamp Mills, Ore Feeders

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—GOLD AND SILVER ORES.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balances; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents:—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

By J. S. PHILLIPS, M. E.

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Price $6.00 postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner		$500, f. o. b.

Compressed Air Locomotives.

Recently was illustrated on this page the newest and best in electric locomotives. Herewith is portrayed the latest in compressed air locomotives. In mine work the steam locomotive is impracticable; danger from fire and sparks, difficulty of disposing of smoke, practically prohibit that form of locomotive in underground workings. While every devised form of application of power or energy has its special field, in the operation of underground workings electricity and compressed air seem to be direct competitors. A brief description of the newest applicant for public favor is therefore of present interest.

The locomotive which is herewith illustrated is now working in the Susquehanna Coal Co.'s No. 6 shaft at Glen Lyon, Pennsylvania. It was built by H. K. Porter & Co., Pittsburg, Pa. Fig. 1 is a side elevation, Fig. 2 a front view, and Fig. 3 a rear view, the dimensions being arranged with a view to the size of the passages in which it operates.

Its most prominent features are the air tanks or receivers, which take the place of the boiler in the ordinary steam locomotive. In this engine the two air tanks are each 29½ inches in diameter, and have an interior capacity of 130 cubic feet. They are cylindrical in form with convex heads. the front head being provided with a manhole. The horizontal seams are treble butt riveted and the heads are double riveted. Each reservoir is tested to carry a regular pressure of 600 pounds to the square inch. The tanks are provided with reducing valves, and there is an auxiliary reservoir from which air is supplied to the cylinders at a pressure of from 100 pounds to 140 pounds as may be desired. The pressure is changeable at will by means of valves.

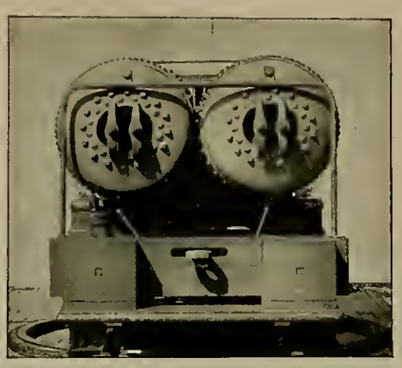

FIG. 2.—FRONT VIEW.

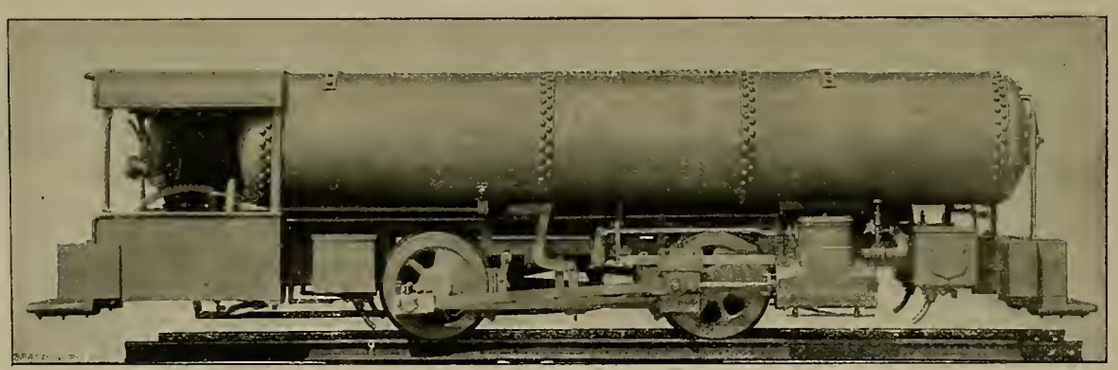

FIG. 1.—SIDE ELEVATION.

From this auxiliary reservoir the air passes into the cylinders, which are 7 inches in diameter and 14-inch stroke. The engine is carried on four wheels or drivers. These wheels are 24 inches in diameter and provided with steel tires. The crossheads, guides, connecting rods, and crank-pins are all made of steel, as are also the axles. The valves are actuated by an ordinary link-pin motion and the links are of steel. The levers, gauges, etc., are placed in easy reach of the engineer and can be controlled by him without moving from his seat. The engine has been planned and arranged to work under the hard conditions necessary in a mine tunnel—moisture, rough track and similar drawbacks and to stand long hours of work with the shortest possible intervals of rest for oiling, cleaning, etc. The engine is fitted with a powerful screw brake, acting upon all the four driving wheels.

The gauge of the mine track in this instance is 36 inches; the length of the engine over all is 17 feet 6¾ inches, its extreme width is 62 inches, and its extreme height above the rail 60 inches. The total weight ready for service is 18,500 pounds. The only machinery required is the air compressor already at work in the mine.

FIG. 3.—REAR VIEW.

In "Concentrates" this week appears an extract from a private letter which indicates what California miners are doing in the New El Dorado—Buluwayo—from where, Mr. Clark writes, was but recently in the heart of a savage country. His letter reads like a fanciful romance, but is rather under than over the truth. That country is the present marvel of the world, and Californians, as usual, are greatly in evidence therein.

About sixteen years ago Supt. McLaughlin put in a telephone on his Eocene ditch in Butte Co. Similar telephones were also put in in other hydraulic mines in Trinity Co. The fact is ancient history, but recent developments in important telephone patent litigation between the American Bell Telephone Co. and the Western Construction Co. indicate that those old California telephones and the date of their installation may play an important part in determining the priority of and just title to valuable patent rights.

The statement "all shares subscribed" in the glowing prospectuses of some of the British South African mining companies is receiving legal inquiry as to its meaning and the liability in case of misstatement on that point. It is probable the common-sense adjudication of the matter will result, as elsewhere, in the principle that where a company advertises "all shares subscribed," and offers those shares for sale, it is to be fairly assumed that purchasers of shares would be buying them from bona fide purchasers, who were responsible under the law for fraud or misrepresentation.

So far no contracts have been secured here for the construction of Japanese battleships. Commander McGiffin, longtime prominent in Oriental naval service, has a different idea of Japan from the popular one. He says Japan "bows and smiles, pats Americans upon the back, thanks them for having led her away from barbarism into civilization, and assures them that she wants to do business with them, while in reality she hates Americans and will buy whatever she has to buy elsewhere than in America." This is probably exaggerated. It seems more likely that the non-securing such contracts is due more to the difference in Oriental and Occidental styles of doing business. With us it is "yes" or "no," "go" or "come," and business is expedited. Our Japanese friends have a thin veneer of Americanism, but under that is the dull bulb of placidity and smiling delay. The "manana" and "poco tiempo" of the Mexican is celerity itself compared with the working of the Japanese business movement. It is not sloth nor inertness: it is just their way, and can only be overcome by patient persistence, "never hasting, never resting." Our German competitors have learned that.

One of the very few journals of the country which received an award at the World's Columbian Exposition was the Mining and Scientific Press. The diploma was for the character of its editorials and the accuracy and reliability of its mining news. The diploma itself has not yet been received, but an official copy signed and approved is in this office.

The retirement for age of Gen. Schofield, Col. Mendell, Prof. Davidson, et al., would indicate that the sure way to insure retention is to be a successful candidate for President, when the age limit would cut no figure.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Compressed Air Locomotive—Front View; Side Elevation; Rear View, 249. A Steel Chimney, 253.
EDITORIALS.—Compressed Air Locomotives; The New El Dorado; Telephone Patent Litigation; "All Shares Subscribed;" Commander McGiffin's Idea of Japan; An Award at the World's Columbian Exposition; Retirement for Age, 249. The Miners' Convention, 250-51-52-54-55.
SCIENTIFIC PROGRESS.—Terrestrial Helium; New Process for Manufacture of White Lead; Huxley's Adherence to Science; "Crostase," 256.
MECHANICAL PROGRESS.—Tempering Steel; Welding Copper and Iron or Steel, 256.
ELECTRICAL PROGRESS.—The Monocyclic System in Salt Lake, Utah; Closed a Contract; Electric Bicycle Lamp; Doubtful Trolley; New Primary Battery, 256.
PRACTICAL INFORMATION.—Advantages of Heating Feed Water; Removing Grease and Dirt from Machinery; Artificial Marble; The Earth's Unseen Moons; Permanganate of Lime; Tungstate of Soda, 257.
THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 262.
MISCELLANEOUS.—Some Legal Points; "The Coming Crash," 252 Steel Chimneys; Reasonable Geology, 253. Concentrates, 255. Coast Industrial Notes; Personal; Commercial Paragraphs, 262.

FROM every quarter come words of approval, praise and commendation for this paper, which, of course, is very gratifying; for any one and every one likes such things. To publish a part of those pleasant letters would take up too large a portion of our space, bnt they are none the less appreciated and sincerely prized.

PROBABLY nothing better illustrates the present British activity in Sonth African mining shares than the appearance in staid trade journals of age and credit of fnll-page advertisements of sundry speculative schemes. In the current number of *Machinery*, devoted to iron and steel trade, machinery and implements, appears a full-page advertisement of "The Federated Mines Prospecting and Finance Co., Lt'd," capital £250,000, 250,000 shares, payable on the installment plan at £1 each. The prospectus states it is the intention to bny and sell shares in other mining companies. A similar announcement is made of the "Bnlnwayo Consolidated Gold Fields, Lt'd," same capital, shares similarly secnred, same pnrpose. The London mining and financial papers are crammed with similar spread-eagle announcements, but the journal referred to fnrnishes the first observed instance of a conservative technical journal yielding to the pressure.

THE business of prodncing gold is at present nnique in being the most profitable of any commercial or business pnrsuit for these reasons: it is entirely unaffected by overproduction, competition or fluctnation of price, being the only industry of which these things can be said; its relative purchasing power was never higher in the world's history; never before could it be more cheaply produced. These few facts comprise the reason for the present activity in gold mining, and are the reasons for our belief that gold mining in California will be the State's most prominent and paying industry for an indefinite term of years. The best wheat authority in the State has jnst proved in a series of unanswerable articles that wheat growing in California means inevitable bankruptcy; it is a plain fact that in fruit the qnestion in California is no longer how to grow fruit, bnt how to sell it; other fields are overdone and overrun, and in every pursnit bnt that of the miner exists the closest competition. The miner is to-day the best consnmer of the products of the State, the surest pay, the most desirable cnstomer. The logic of this as regards the State is that the commonwealth shonld co-operate in all just efforts for favorable legislation, not as a conclusion or a granted privilege, bnt a duty. As regards general business, it is equally manifest that, as in bygone years, so now; the State's most material prosperity lies in the possession of the world's greatest gold deposits, coupled with the greatest ease of access and most congenial snrronndings.

The Miners' Convention.

The fourth annnal convention of the California Miners' Association was the event of the week. Wheu President Neff rapped with his gavel at 11 last Monday morning the association was represented by 500 delegates in Pioneer Hall, which was decorated with paintings and banners in honor of the occasion. Above the chairman's seat hung a very large painting of a farmer and miner clasping hands; on it were the words: "Prosperity to our country, California; the land of gold, sunshine, fruits and flowers."

Immediately after calling the convention to order, President Neff invited H. Craig, vice-president of the San Francisco Chamber of Commerce, to the platform, who, ou behalf of the citizens and commercial associations of this city, welcomed the delegates, assured them the merchants realized that the local miners were their best customers and spoke in eulogistic phrase of the California miner and what he had done.

A committee ou credentials reported the following named delegates entitled to seats:

Alameda county—S. B. Christy, J. L. Brown, G. W. Baker, J. B. Eldridge, G. Goodman, T. W. Jeffress, J. L. Lyon, A. F. Merriman, W. P. Miller, T. L. Machin, J. L. Mayon, J. J. Newson, F. M. Phelps, E. C. Rigney, G. I. Taggart, W. R. Thomas, A. A. Wood, J. M. Wright, M. Wehber.

Amador county—J. R. Tregloan, M. J. McDonald, W. J. McGee, F. Voorhies, G. Murphy, J. A. McIntire.

Butte county—I. M. M. Allen, S. S. Boynton, C. C. Belding, W. E. Duncan Sr., G. W. Dyer, A. Ekman, E. W. Fogg, G. F. Geisse, J. Gale, R. A. Green, E. Harkness, W. Hawkins, H. C. Hills, W. James, A. Northwestern Mining Association—W. E. Everette of Tacoma, Wash.

President Neff theu delivered an address as follows:

We have heard it remarked hy some of those who live helow the foothills that the miners have been sending the mountains down into the valleys, hut as I look aronnd over this convention it seems to me that the mountains have come all the way to the hay. Here are men from the snowy peaks and wooded canyons in the great Sierra, hringing with them the fragrance of the pine to mingle with the salt air which sweeps carelessly in over this fair city from the broad Pacific. They come up their shafts and from ont their tunnels, lay aside their rough garb, their picks and shovels, and meet here to discuss the welfare of their chosen industry. The citizens of the metropolis which owes so much to their efforts extend the warm hand of welcome and join with them to give advice and assistance. These are material interests we represent; productive ones, with no fine-spun theories requiring philosophical and abstruse discussion, hut calm practical every-day business judgment. We from the mountains who gather the tiny scattered grains and specks of gold from the ribs of rocks, the channels under the great lava-capped divides, the canyons and gulches of the nills, and the bars of the rivers, each contribnte our mite toward swelling that golden stream which flows day hy day, month by month and year hy year into the channels of trade in the cities. Feehle as may be our individual efforts, yet the result of our combined efforts is to bring to the centers of trade over eleven hundred thousand new dollars in gold every month. And when all the hranches of our work in California are considered we can show a yearly product of the value of twenty millions of dollars. When it is remembered that fourteen millions of this is gold, which is the basis of all value, the life hlood of all trade, we feel that ourselves and our industry are worthy of the moral support which we ask of the citizens of the State. What we bring to you is new wealth, hright and shining from Nature's treasury, not mere figures gained from trading one with another.

Ours is distinctively a productive industry, and the one which was not only the foundation stone on which this favored State was built, hut the keystone of the arch of the completed structure. It may be said without fear of contradiction that for the past two years at least no single industry of California has prospered more or heen more profitable than mining. We who are engaged in it feel proud of this fact, and it enables us moreover to come hefore the other people of the State and ask their aid and support in freeing this great industry from certain features which retard its progress, and in obtaining such legislation and recognition as should double its productiveness. For a long time previous to the inception and organization of this body the mining interests of this State languished. They were neither encouraged hy the people nor hy the laws. A wrong opinion prevailed concerning them. It was supposed California was no longer a mining State, and the miners were left to care for themselves. But when the California Miners' Association was organized and we brought to the attention of the nhlic the true state of affairs and our necessities, our plea was listened to and our cause taken up with earnestness. And I wish here, on hehalf of my hrother miners throughout the State, to express profound gratitude to the merchants and husiness men of San Francisco for the satisfactory and earnest moral support and practical financial aid they have given us from first to last. Without this assistance, so freely and handsomely rendered, we should have failed in our efforts. This fact should he impressed on the memory of every miner in the mountains of California, who should hold in high regard the Board of Trade and the Chamher of Commerce and the individual merchants and manufacturers of San Francisco. What has heen accomplished is familiar to all of you. Possibly we have not gained as much as was hoped for, hut only those who have taken an active part in the administration of our affairs know the difficulties we have had to surmount, and some of which still confront us. When we hegan this agitation there was scarcely a single hydraulic mine operating legally in the drainage hasin of the Sacramento and San Joaquin rivers. Now there are a hnndred, and more heing added daily, all under protection of the law and injuring no other interests. Meantime our gold product is slowly creeping up almost a million dollars a year toward its old standing. While the new law is by no means entirely satisfactory to the miners, yet it is a long step in the right direction, and the fact remains that with it one may mine legally hy hydraulic process, while without it we could not mine at all. It will he part of our duty to obtain further legislation which will remove some of the objectionahle features, at the same time not infringing upon the rights of others.

We have heen represented as desirous of destroying the navigahle streams and the farming lands along their banks, without any consideration of the damages to others caused hy our work. In the older days of the past, when there were no restrictions or necessity for them upon any form of mining, damage of this kind was doubtless done; and some few men cannot be brought to recognize fully the changed conditions. These are of the same class as those few unalterably opposed to hydraulic mining and who desire its absolnte suppression. Notbing is so difficult to overcome as prejudice, but it remains for the people of the State, with calmer judgment, to stand between the extremists and so adjust tbeir differences, that the real benefits may be derived aud the real damages pre-

vented. That this can be done we now know. The main body of the miners of this State recognize clearly that if they pursue this branch of their calling, it must be so done as to inflict no damage whatever. In all this controversy this association has endeavored to pursue a conservative course and an honest one. It has simply asked for justice; and when this beneficent Government more fully understands the question and its conditions, it will doubtless still further aid the miner in his effort to wrest from nature's storehouse those treasures upon which the credit of the nation is established.

Upon this association devolves the duty of bringing the facts before Congress. This matter has by no means been lost sight of by your executive committee, as reports to be read will show. But we must remember that in the many things before us we are representing all classes of miners, and the interests of one must not be neglected by exclusive attention to those of the other. All these affairs can be carried on simultaneously, but it is only during the sessions of Congress that certain of them demand immediate care.

In accordance with the instructions of the Miners' Convention of 1891, considerable time has been devoted during the year to prevent further encroachments on the mineral domain by the railroad companies. The correspondence on this subject will all be laid before you that you may know the details of the steps taken by the special committee having this matter in charge. The position of the association is very simple. It has no fight with the railroad companies other than seeing that justice is done to the mining community. It does not want anything which belongs to them; does not wish to interfere with any of their rights; does not desire to obstruct or hinder them in obtaining title to lands which are properly theirs, or to meddle in any way in the conduct of their affairs. But this association does intend, if it is possible, to prevent these companies obtaining title to any more mineral lands in the State under guise of agricultural land. As you all know, such mineral lands were expressly and in plain language excepted from the grants made to these roads by the Congress of the United States. The railroad companies themselves acknowledge this to be the fact, yet by the iniquitous system which has been carried on for years in the patenting of these lands, hundreds of thousands of acres of the mineral domain have passed from the possession of the Government into the ownership of these corporations. This system is still being pursued, and will be continued unless we have the power to stop it. The heritage of the prospector is passing from him and he seems powerless to stop it without assistance. While, as I have stated, these companies profess to make no claim to the mineral land, yet the fact remains that they have been taking it and are continuing to do so. That it is done under cover of the law and through the proper departments makes it all the more difficult to overthrow the established system. And it is to be noted that notwithstanding these professions of the companies that they want no mineral lands, the mineral claimants are all contested by railroad attorneys before the land offices, and the companies themselves, through their agents, are pursuing an obstructive policy and in every way hindering our efforts to obtain a fair, honest and legal solution of the problem. Our proposition for proper classification of these disputed lands, over which there should be no dispute, are met by specious and procrastinating arguments and counter propositions, which, when analyzed, mean nothing but a determination to outwit us if possible and continue the old course unmolested. And all this in the face of the fact that we only want what the Government reserved for us and declined to give them. We want the lands classified simply that we may know and they may know which is theirs and which is ours, and this is all we ask at their hands.

That these companies will ever consent to any agreement in which the full rights of the miners will be recognized, is doubtful. They will consent to one in which his rights *appear* to be recognized, but when it comes to pin them down to an exact, fair, square agreement, we find it difficult to do so. Meantime, in addition to the obstructive policy mentioned, the officers of the association and the members of the committee are submitted to abuse and misrepresentation at the hands of the subsidized newspapers in the hope of turning public attention from the matter on hand, and disheartening those engaged in carrying out the wishes of the miners of the State.

There is only one of two things for this association to do. It must carry on this fight to a finish or drop it altogether. The mineral lands of California are worth hundreds of millions of dollars, and if we, and the people of the State, through apathy or neglect, permit them to pass into the hands of these corporations, who have no right or title to them whatever, we simply make them a present of so much wealth which belongs to us, and have only ourselves to blame.

It must be confessed, I am sorry to say, that not all of the County Miners' Associations which go to make up this organization fully recognize the importance of our work in this direction. They have not given it the assistance or moral support expected. Some of them, in fact, have even developed a spirit of opposition, possibly through lack of proper knowledge of the matter, or for perhaps other causes which it is not necessary to mention.

But I want to say to the representatives of all these county associations that unless they put their hands in their pockets and furnish their proportion of the funds necessary, we may as well go out of business. There is no use in coming here to San Francisco, meeting in convention, making speeches, passing resolutions, etc., and then going back home and letting the whole matter take care of itself. It needs close and unremitting attention and it needs money. I want you thoroughly to understand that no man in your executive committee, legislative or protection of mineral lands committee, or any other, has received a single cent of compensation for any kind of services whatever. Now remember that, because misrepresentation in this connection has been repeatedly made. No salaries are paid, except a nominal one to the secretary, and he does not draw even that. But we have gone as far as we can without funds. If we have a commission to classify mineral lands the salary and expenses must be paid. If we have matters before Congress, and have to send some one there, he must be paid for his services. We must have money for stationery, typewriting, postage, printing, telegrams and all sorts of miscellaneous expenses. No money is frittered away, but every expenditure is carefully criticised by the committee.

There are gentlemen who have served on some of our committees during the past two or three years, who have performed gratuitously services properly worth thousands of dollars, and even, in view of the magnitude of the interests involved, tens of thousands of dollars. Many of you living at a distance scarcely have any appreciation of the work done, or the time involved in its accomplishment. Some of these gentlemen have received criticism instead of thanks, and I grieve to say, several decline to serve further, asking that others be appointed in their places. As your president, it has come within my province to know the details of work done, and to know the gentlemen who have done it. In fact, they have all performed active service. Your efficient and competent secretary, Mr. Ralston, continues to be as active and energetic as ever, which is all that need to be said. Mr. Sonntag, your treasurer, exercises due care of your funds and actively interests himself in our progress. Mr. Ricketts, as chairman of the committee on protection of mineral lands, has had more work on his shoulders than anybody else this year and has done it intelligently and with effect, and he has been ably seconded by his colleague, Mr. Wright. Mr. Ford, as chairman of the committee on legislation, has had no light task to perform, and we owe him thanks not only for that work, but also for what he has accomplished in one branch of the Legislature, while Mr. Thomas was eloquently doing his share in the other. We all remember Judge Searle's able efforts before Congress, and those of Mr. Cross on various committees. Mr. Thornton has helped us wonderfully in the matter of collection of funds, and others have performed numerous duties requiring intelligence and care, for which they deserve our thanks.

As I have told you, I hope you will not here in convention pass a lot of resolutions and issue a lot of instructions to your officers and committees which will require expenditure of money, and then go off and leave the officers and committees to collect it. You must make more definite arrangement about monthly contributions from members of county associations to maintain this organization. And when you make it, devise also some means of collecting it, and some way of transmitting it regularly to our treasurer, so that the executive committee may be enabled to use it. This is a business feature which demands immediate attention and I commend it to your consideration.

And now, gentlemen of the convention, before we proceed to the business before us, I want to urge upon you all to consider well the course the association is to pursue during the coming year. In preparing your resolutions frame them so that your committees will know exactly what they are to do, and then let them do it in their own way. It is suggested also that your ideas are desired as to the relation of the standing committees with the executive committee. Give us some explicit directions in this, so that we may know the powers of the respective committees. Are the sub-committees to submit their plans to the executive committee or only such matters as involve expenditure of money; or are their actions subject to endorsement by the executive committee? On these matters we want instructions. There is no desire on the part of any one to interfere in the work of any other branch, but the respective powers should be defined to avoid confusion and misunderstanding.

Secretary W. C. Ralston read a report of receipts and disbursements, a summary of which is as follows:

FINANCIAL STATEMENT OF THE CALIFORNIA MINERS' ASSOCIATION FROM NOVEMBER 9TH, '94, TO OCTOBER 15TH, '95.

			Cr.
1894—			
Nov.	9.	Balance in treasury	$1,013 52

		Totals	$5,035 52	$5,035 52

Treasurer Sonntag filed his report, which agreed in every particular with that of the secretary. Both reports were adopted.

It was evident from the start that it was to be a business session; there was no contest over anything nor any intention of one; the sole idea was to do what was to be done quickly and harmoniously, and the work moved with the celerity accorded it by trained parliamentarians. There were men in the convention who long ago had wielded the pick and shovel, and had since graced every department of public life from the Legislature to the Supreme Bench; men who were worth millions worked side by side on the committees with comrade miners who had left the drifts and shafts and hydraulic claims a few days before to come down here in joint deliberation for the common good and mutual welfare of the mining industry.

Tuesday's proceedings began by the reading of the report of the Executive Committee, as follows:

REPORT OF THE EXECUTIVE COMMITTEE.

SAN FRANCISCO, October 15, 1895.

To the Gentlemen of the California Miners' Association in Convention Assembled:—Your Executive Committee has the following report to submit for your consideration:

During the past year your Executive Committee has had nine general meetings, at which reports from the committee on Legislation, Protection of Mineral lands and Ways and Means have been received, which were considered fully and at length.

Most of the work for the past year has fallen upon the shoulders of the Committee on the Protection of Mineral Lands, as that was the paramount question for the time being.

Congress not being in session, the Executive Committee was not called upon to meet and discuss matters so often as it was in the year 1894. Unfortunately, most of the time of this committee has been occupied in trying to devise some means of raising funds.

This committee endeavored in every way in its power to raise money from the County Associations; only one county answered by liberal assistance: certificates of $5 each were printed and sent to various counties, and but few responded.

Assessments were levied on each County Association, in proportion to its membership, as is provided by the By-Laws of the Association, and but few paid that.

The Board of Trade of San Francisco donated $1000 to the Association, without which we would have been unable to continue our work. In fact, the committee was obliged to borrow $400 from the Placer County Miners' Association to defray current and necessary expenses.

This committee found it necessary to send a representative to Washington to place the question of the railroads and the mineral lands before the President of the United States and the Secretary of the Interior. The services of this representative were given without remuneration; only his expenses were paid.

Only $3000 of the $5000 expended in the past year was used in the endeavor to reserve the mineral lands of our State to the prospector and miner.

No officer of the association has received one cent in payment for services rendered during the past year.

This committee cannot continue its labor without some fixed income to depend upon.

The Finance Committee and Committee on Ways and Means have done good work in assisting to raise funds, and to them we wish to extend our thanks.

To the press of San Francisco, and a few interior journals, we are indebted for valuable assistance, and hereby extend to them our thanks.

For a detailed statement of the receipts and disbursements, you are respectfully referred to the reports of the secretary and treasurer.

The secretary omitted to state in his report that there is an indebtedness of some $700, due for the employment of an attorney at Washington, who was engaged to obtain the information regarding the Railroad Land Lists, so that proper protests could be made by the Committee on Protection of Mineral Lands. Respectfully submitted.

W. C. RALSTON, Secretary. J. H. NEFF, President.

The report was ordered filed. Chairman T. L. Ford of the Legislative Committee then read the report of that committee, which will be found on page 252. It was adopted. Chairman A. Carrigan of the Committee on Revision of Constitution and By-laws read those documents as revised, which, with two or three suggested amendments, were voted on and adopted. The amendments make some changes in the amount and manner of payment of dues. As adopted, the annual membership dues for all branches of the association are as follows: Mercantile houses and manufacturing concerns of San Francisco shall pay $50 per annum; mining companies shall pay $25 per annum; all individual members of the associations in counties abutting on San Francisco bay, $5 per annum; in all other counties of the State, mercantile houses, manufacturing concerns and mining companies shall pay $25 per annum and all other members $1 per annum, thus doubling the relative amounts paid by residents of the bay counties.

Dues are to be collected by the county branches, and 75 per cent of the same paid to the secretary of the California Miners' Association, the remaining 25 per cent to be retained by the county branches to pay for the cost of collection of dues and for the maintenance of the branch associations.

The annual dues of the association are to be paid on or before the second Monday of July in each year, and if not paid before the last Monday of September, any member so delinquent to be suspended from the association and his name dropped from the list thereof. Any member so suspended is not to be readmitted to any membership unless he pays up his back dues previous to the time of his suspension; he is not required to pay a new initiation fee.

The Executive Committee may from time to time levy such assessments upon county organizations as the necessities of this association may require. Any county organization delinquent at the time of the annual meeting, on account of any assessments levied prior to ninety days preceding such date, shall only be entitled to representation for members in good standing.

It was further provided for in the by-laws that all persons friendly to the mining interests are eligible to become members of the various branches of this association. In the event that there is no county organization in the county where he resides such person may unite with the State association by forwarding his name to the secretary thereof and paying an initiation fee of $1 and the annual dues as hereinafter provided, and he will be furnished by the secretary with a certificate of membership. But this shall not constitute him a delegate to the meeting of the association. County organizations may admit non-residents as members.

When this matter was finally settled by a unanimous affirmative vote, A. H. Ricketts, chairman of the Committee on the Protection of Mineral Lands, read the report of that committee as follows:

REPORT OF THE COMMITTEE ON PROTECTION OF MINERAL LANDS TO THE ASSOCIATION.

SAN FRANCISCO, October 14, 1895.

To the California Miners' Association—GENTLEMEN: The Committee on the Protection of Mineral Lands of this association has the honor to report as follows:

That the first step taken by it in pursuance of its appointment and the authority vested in it by this association was an attempt to prevail upon Congress to pass an act containing provisions essentially similar to the bill then pending before it regarding the examination and classification of the mineral lands lying within the limits of the grant to the Northern

(*Continued on page 254.*)

Report of Committee on Legislation.

The following report was read and adopted by the convention:

To the President, Officers and Members of the California Miners' Association—GENTLMEN: Your committee on legislation beg leave to report as follows:.

Your committee was appointed at the annual meeting of the association in November of last year (1894), and at once took such steps as lay in its power to carry out the wishes of the association in respect to matters of legislation.

Since the appointment of your committee there has been one short session of Congress, namely, from December to March last, and one session of our State Legislature.

Pursuant to the resolutions adopted by the association at its last meeting, above referred to, your committee drafted two bills for introduction in Congress, but, owing to an entire lack of funds and to the shortness of the congressional session, your committee was wholly unable to secure any legislation at the hands of Congress during its last brief session.

With our State Legislature your committee was more fortunate. Two measures were drafted and presented to the Legislature, both of which successfully passed both houses of the Legislature, and one of which met with executive approval and thus became a law. This latter measure—now a law—provides that when an injunction is granted prior to the trial of a case it shall not continue in force longer than one year, unless the parties consent thereto or the case be set down for trial. The other measure above referred to provided for appeals from judgments and orders of contempt This measure, however, met with an executive veto and thus failed to become a law.

The legislation secured at the last session of the Legislature was without any expense whatever to this association.

Your committee is of opinion that but little more can be done by our State Legislature than has been done, and that the mining industry must look to the National Congress for ultimate relief. In that behalf your committee begs to submit a brief review of the legislation already obtained:

FIRST.—*Legislation Relating to Hydraulic Mining*—Prior to the passage of the law commonly known as the Caminetti act there had been no direct legislation, either State or national, concerning the business of hydraulic mining. The industry in question had never been either condemned or approved by legislative action, and the courts had never gone further than to hold that the business of hydraulic mining might be enjoined whenever the same was so conducted as to become a nuisance within the meaning of the law. The business itself has never been declared to be unlawful. The Supreme Court of this State, in a case appealed from Yuba county, said: "It seems to us it migbt be conceded that the business of hydraulic mining is not, in itself, unlawful, or, necessarily, injurious to others. The unlawful nature of the business results from the manner in which it is carried on, and the neglect of parties engaged therein to properly care for the debris resulting therefrom."

Even in the celebrated Sawyer decision in the North Bloomfield case the court recognized the fact that the owners of the mine in question might provide suitable means to properly care for the debris resultiug from their mining operations, and left the injunction open to future modification or dissolution whenever such means had been provided. In Octnber, 1892, the same court (the United States Circuit Court), sitting in the same case (Judge Gilbert presiding), did modify the injunction and hold that proper restraining works had beeu constructed by the North Bloomfield Mining Company, and permitted the company to resume operations.

Thus it will be seen that prior to the enactment of the Camiuetti law the State and Federal courts both recognized the right of the hydraulic miner to conduct the business of hydraulic mining so long as he could do so without working material injury to other interests, aud this principle has also been incorporated in the statute law of California. The Gilbert decision not only recognized the right of the hydraulic miner to construct restraining works, but held that one of the largest hydraulic mines in the State had actually constructed such works and that they were sufficient to satisfy the law.

There was an attempt made in the Legislature of '87 to invest the business of hydraulic mining with a criminal character, but the attempt failed, and was not renewed prior to the passage of the Caminetti act.

Such was the condition of the law when the Caminetti act became a law iu March, 1893.

Provisions of the Caminetti Law. — The Caminetti act provides that no hydraulic mining (in the territory described in the act) directly or indirectly injurious to the navigable streams shall be carried on otherwise than under the provisions of the act. Any person carrying on such mining otherwise than under the provisions of the act is to be deemed guilty of a misdemeanor, and shall be punished by a fine not exceeding $5000 or imprisonment not exceeding one year, or by both such fine and imprisonment. To gain a permission to conduct the business of hydraulic mining the mine owner must file a petition under oath with a Federal Commission of U. S. Engineers, when notice of hearing the same is given by publication. If, upon inspection, the Commission conclude to grant the request of the petitioner, the Commission are to specify the location and character of the works to be constructed. These works are to be constructed wholly at the expense of the mine owner, and mining shall not be begun uutil such works are completed and approved by the Commission. Such restraiuing works would also take care of the debris resulting from causes other than hydraulic mining.

The Changes in the Law.—1. Under the Caminetti act the miner may coustruct restraining works as before, except that such works shall be constructed under the direction, and subject to the approval, of a Commission of United States Engineers.

2. Criminal proceedings against the miner are permitted in addition to the civil remedies already allowed by law.

3. The miner, upon a compliauce with the requirements of the act, is to be afforded such protectinn as may be given him within the limits of Federal authority.

The act, as originally introduced in Congress, contemplated an appropriation by the Federal Government for the purpose of constructing works for the restraining and impounding of mining and other debris, and further contemplated the use of such works by the owners of hydraulic mines upon the payment by such owners of three per cent of the gross yield from such of their mines as used the works thus constructed by the Government. The act as finally passed, however, did not contain any appropriation for the construction of restraining works, and a proviso was added to section 13 of the act whereby the miue owner was required to construct, wholly at his own expense, the works necessary to enable him to operate his mine under the terms of said act. Thus the privileges to be obtained by the miner under the "three per cent" clause of the act were rendered unavailable both from the lack of an appropriation and the added proviso above noted.

In the meantime the Legislature of California took hold of the subject and passed such measures as lay within the limits of State autbority. The first measure laid down the principle that hydraulic mining might be carried on within the State whenever and wherever tbe same could be carried on without material injury to other interests. The next step was to provide the means necessary to enable the hydraulic miner to to comply with the principle, or condition, thus established. To this end our State Legislature of 1893 appropriated the sum of $250,000 to be used in the construction of works for the restraining and impounding of mining debris, conditioned, however, upon an appropriation by Congress of at least as much for the same purpose.

This legislation was followed by the State Legislature above referred to relating to injunctions, and the attempted legislation relating to appeals from judgments of contempt.

Recapitulation.—It will thus be seen that the legislation thus far has been:

First—An act of Congress, which, in the absence of an appropriation, is of but little practical utility to the hydraulic miner.

Second—Certain State legislation defining hydraulic mining, prescribing the conditions under which it may be carried on, making an appropriation tn aid its rehabilitation, and modifying the law relating to temporary injunctions.

Relief Must Come from Congress.—It will thus be readily seen that we have reached the point where the further efforts of this association must be directed to an appeal to our National Congress.

We herewith present a proposed bill which has already received the endorsement nf the association, and which, while it may leave some undesirable features of the present Congressional act untouched, will, in the opinion of your committee, if enacted into law, place tbe industry of hydraulic mining where its ultimate restoration will be assured.

SECOND.—*Legislation Affecting Mineral Lands*—The sole power to dispose of the public mineral lands of the United States rests in the Federal Government, and all legislation in that behalf must, therefore, be obtained from the National Congress.

Prior to 1866 the mineral lands lying within this State were held and worked under mere possessory titles, based upon local customs and usages. In tbe year last named Congress granted the right of exploration and purchase of the public mineral lands, and laid down certain rules that should govern the possession and acquisition of title of such lands. Tbis law was amplified and re-enacted in 1872, and its provisions, somewhat amended, were afterward carried into the Revised Statutes of the United States, covering Sections 2318 to 2352 of the Revised Statutes.

These provisions, while permitting the miner under certain conditions to obtain the title to his mining ground, were still far short of a complete solution of the difficulties tbat encompassed the mining industry. Time has developed many imperfections in the law that could not have been foreseen at the time of its enactmeut, and especially has this been made apparent in tbe matter of contests betwcen mineral and agricultural claimauts.

In the opinion nf your committee, tbe time is fast approaching, if it has not already arrived, when there should be an entire remodeling of our mining laws, conformable to the necessities and requirements which time and experience have developed.

Pending such legislation, however, your committee would recommend tbe passage of tbe proposed bill herewith submitted, looking to the amendment of certain of the above sections of tbe Revised Statutes of the United States.

This proposed measure, if enacted into law, will bave the effect of transferring from the land offices to the local courts all contests between agricultural and mineral claimants as to the character of the land in controversy, thus bringing such contests nearer home and lessening the expense to the contestants. A certain, safe and just rule would be provided for the determination of the character of such lands, and the miuer al claimant would be relieved of many burdens which are now unjustly imposed upon him. Otber changes will be noted upon an examination of tbe proposed measure.

Conclusion.—In conclusion, your committee beg leave to suggest that, as Congress meets in December uext, it is of the utmost importance that there should be no delay in the needed preparation for the presentation of our case to that honorable body. Our delay has already cost us much and rendered more difficult the work iu band, and if we permit the approaching session of Congress to run its course without having taken some action looking to the relief herein suggested, the cause for which this associatiou has so earnestly labored will have been seriously retarded. Respectfully submitted,

TIREY L. FORD, Cbairman.

Some Legal Points.

No custom is permitted to prevail over the express words of a contract.

In general a suit is to be determined upon the state of case existing when it was instituted.

Where there is a breach of contract, the law fixes the measure of recovery, and whether the breach was accidental, or willful and inteutional is not material.

A person dealing with a general agent, acting within the apparent scope of his authority, is not bound by private or secret instructions from the principal to the agent, not made known, or of which such person has no knowledge.

The rule seems to be well settled that if, at the time of a contract or purchase, the seller knows the buyer has an existing contract of resale, and the object of the purchase is the performauce of that contract, the profits derivable from the resale are recoverable.

On the other hand, when a contract of sale of goods is broken—the price not having been paid in advance—by the failure of the vendor to deliver them according to the terms of the bargain, as a general rule, the measure of damages the purchaser is entitled to recover is the difference between the contract price and the market value of the goods at the time and place of delivery, with interest.

Where one, by fraudulent representations, iuduces another to purchase corporate stock as an iuvestmeut, the loss which the purchaser suffers by retaining the stock under the belief that the representations are true is chargeable against the wrongdoer, such loss beiug presumptively within his contemplation at the time of committing the fraud.

It is entirely competent for debtor and creditor to agree upon a date or a contingency upon the occurrence of which the debt matures and becomes payable, or alternatively upon a date aud a contingency; the date to toll maturity unless the contingency happens before it transpires, and the contingency to mark the time of maturity if it happeus before the alternate day fixed in the contraet.

"The Coming Crash."

TO THE EDITOR:—In England, France and America, for some time, financial savants have been prophesying dire disaster to all who use their resources in a channel not altogether in their own keeping, and as they cannot stay the tide of enterprise and the flow of millions of dollars into South African mining ventures, they stand amazed and call it recklessness beyond all reason. From the Paris letter of the London *Mining Journal, Railroad and Commercial Gazette* I clip the following:

This element of recklessness has given rise to a good deal of concern among timid people, who have long protested violently against the new "craze." The failure of their forecasts nf a collapse, so far, has apparently added rancor to their rhodomontades, and it has necessitated a calm and temperate article from the pen of the eminent economist, M. Paul Leroy-Beaulieu, to cbeck this growing opposition.

The "failure of their forecasts of collapse" arises simply from the fact of their not grasping the backing which has caused the furor for mining shares, hence they stand aghast while the ball rolls on. Let us see what M. Paul Leroy-Beaulieu says, for iu his observations is a pith that will be well for our wise meu to consider:

M. Paul Leroy-Beaulieu points out that undoubtedly a great many investors will suffer in the end, but this is the price that has to be paid for all great financial and commercial movements. The Rand has opened up an enormous field for the active employ of French capital which bas for too long a time lain, like the talent in tbe parable, wrapped up in a napkin. Money is abundant and cheap, and the only way to use it profitably is to boldly risk it. Some of the money will be lost in tbe great channel of speculation, but by far the greater part cannot fail to be extremely productive not only to the investor but also to the country generally. Where the money goes, there follows trade. In point of fact, the gold fever is the salvation of French finance, and this is begiuning to bc understood by French investnrs, who have unbounded confidence in the future of gold mining. The forcing up of prices is certain at some time or other to bring about a reaction, but this must be followed by the placing of the gold-mining industry upon its proper level, when it will once more take up its position as a legitimate investment.

There is, however, a general waiting for the coming crash, and in England and Paris they have beeu prophesying it for the past two years. When the *Mining Journal, Railroad and Commercial Gazette*, some years ago, favored to a limited degree South African investmeuts in mining ventures, it was ceusured to an unjust degree by the commercial journals as lending itself to wild ventures, but time has proved that the *Gazette* was right and the "coming crash" is not yet. Instead, the yield of the mines has expanded aud with this expansion is the outflow of capital into South Africa and elsewhere, and the whirl of speculation is moving onward with it. Some comparison is made to the South Sea bubble and the Panama Canal craze, but in these there is no comparison; on the contrary, there is a marvelous backing to all this speculation. And while experience teaches us on this coast that speculation in mining shares always overrides net returns, yet as respects South Africa the yield has expanded at a ratio to justify the inflation, as inflations go. To my mind the end is not yet, and will not be for years, *provided* the erecting of stamps is maintained at the ratio of the past year, and the prospect is that they will increase.

We must bear in mind that immigration, enterprise and capital are flowing into one of the richest countries of the globe—a virgin continent, we may say, whose gold fields have been explored from Cape Colony to the Lakes, sufficient to know that there could be profitable employment for all the stamps it is possible to erect. They have about 3000 stamps runniug now, producing over $3,000,000 per month in gold, and I would not be surprised if as many more were erected in 1896. The future is beyond any mau's knowledge. A country that has produced some $175,000,000 value in diamonds in the past eight years, and to give full activity to the work could produce $40,000,000 worth per annum, is a wonderful one. Not only is this vast diamond yield a backing for all this mining "craze," as it is termed, but back of this is the product of $141,912,984 of gold, in the past eight years, and which is moving steadily upward. That the reader may grasp this point, and from it be enabled to grasp the possible future of this country, I will detail the yearly product, since mining for gold became active, and as compiled from S. A. journals, as follows:

Year.	*Yield.*
1887	$370,480
1888	3,320,952
1889	5,917,912
1890	7,917,072
1891	11,667,808
1892	19,373,872
1893	23,655,568
1894	32,386,400
1895	37,293,920

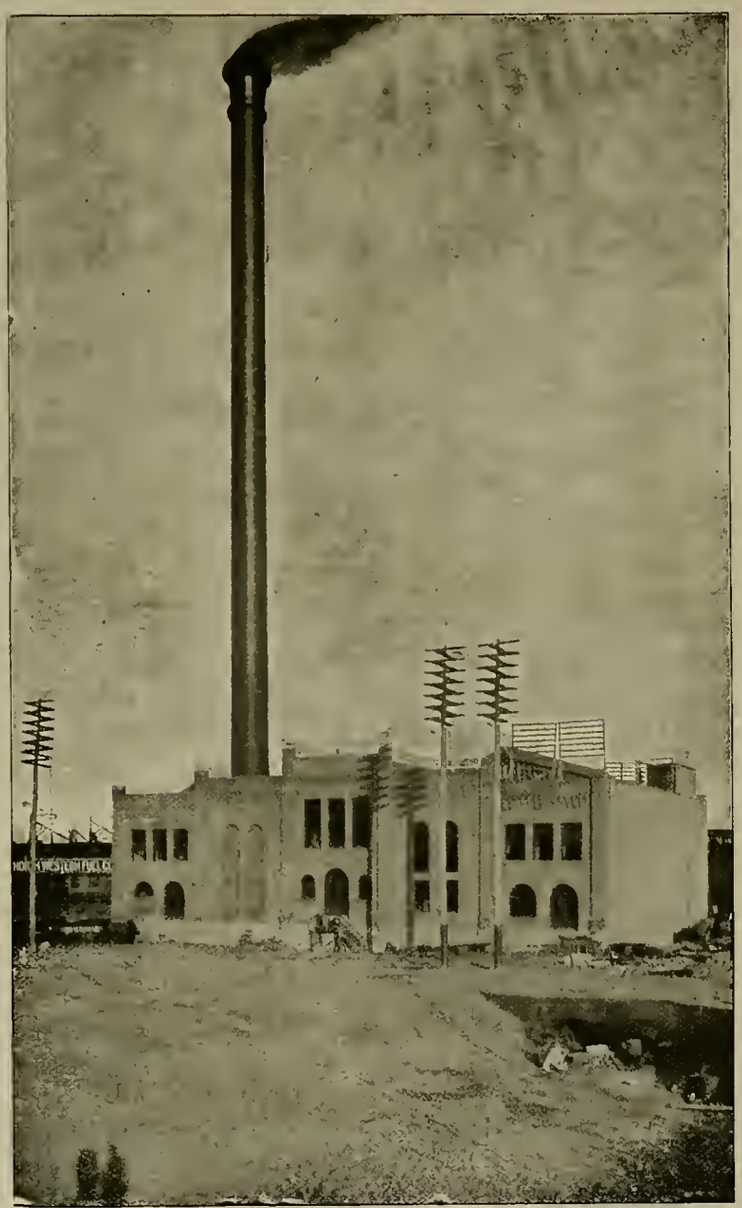
The yield they claim will be $50,000,000 for 1895. I do not doubt but it will be $40,000,000. For 1896 it is likely to reach $50,000,000.

Now where is the limit of speculation on such astouuding figures as these, and here we must consider, too, that when it comes to mining, the English are ten times less brash in their ventures than Americans; besides all this, the English are born miners; they are not afraid of investing their capital; they do not depend on surface scratching, as Americans do as a whole, but on depth, and they mine with pounds to our dollars, in any and all ven-

tures, and from this fact comes their greater success. We call the present epidemic a "craze," forgetting our own wild outpourings. To my mind there is a general good in it all. The blood of the business world becomes warmed, and the hidden dollars get into circulation. To be sure, in the general shuffling of treasury some will become wrecked, but in all such financial upheavals the country moves upward and onward. Within my period of business life and experience, I can call to mind various "crazes," where all the wonders and warnings as to the "coming crash" were heralded by the press as is now in regard to South African speculations. I can call to mind the copper "craze" of Lake Superior, of 1846 7-8, yet it opened up, for that period, the greatest copper mines of the world, and made the iron industry of the United States the peer of England. Also California in '49 and '50, which caused 60,000 people in 1850 to traverse 2000 miles of desert, to say nothing of the 40,000 people who came by sea, to reach this golden shore. And what was the result? The State was born in about one year, and $512,000,000 of gold was the product of the first ten years. Nevada in 1860, and the "bonanza" days of the Comstock! All were "crazes," all wrought wealth and ruin, but $400,000,000 of gold and silver was the reward. When we analyze all, we find that when there is a substantial output back of the speculation, more benefit is the result than evil. Our dislike of this furor arises more from jealousy than distrust, and would to God we had a little of it in California, with all its evils. There is more life, wealth and prosperity in a mining epidemic than in all the staid banking, mercantile and commercial business pursuits. Business houses play on the money in circulation, and seven-eighths are the records of failure. Mining furors bring forth new money, more of it, life to every community, and their record of failures is not seven to eight.

Could any mining craze produce more distress in California than exists at present, with about every farm mortgaged for all it will stand, and which at forced sale would not realize 50 cents on the dollar of the general loans upon them? Would San Francisco real estate suffer for lack of buyers, as at present, had we a renewal of "bonanza days" with all its speculations?

San Francisco business to-day can be compared to an old, decrepit miser, chomping a dry crust of bread for sustenance, not desiring to branch out for healthful food, because it takes money from the coffers. Our prosperity will not advance until a change is inaugurated. Our savings banks are simply absorbers of wealth, for making the rich richer, and in their working bring forth but little productive enterprise whereby labor gets employment, as manufacturing institutions.



Take all our saving institutions, with their $141,000,000 of deposits—what industry do they maintain? Our city savings banks, with their $110,000,000 of deposits loaned on San Francisco real estate—they loan for interest, and interest has eaten it about all up and forced sales to pay this interest, has caused the market to suffer, and this state of things has caused distress in all branches of trade, and there will be no relief until we reach out and bring more money into circulation—more new money. Would we not consider the European-South African craze a Godsend, with its $40,000,000 more new money every year? Did we have it, would not a new condition of things be inaugurated, and would not the good far outstrip the evil? And here we are in a State ribbed with veins carrying the precious metals in abundance, and are not possessed with snap enough to embrace the advantages before us. As far as this European mining craze goes, all I dislike about it is that it puts California in the background in the eyes of European investors, and forces us to rely on our own mining capital, and as a result there must be a decline in the value of our gold properties. If the American people would show the mining spirit of the English, and not be so fearful of the loss of a few dollars, a very great good would be the result, as then the production of our mines—all the new money—would be kept at home, and the native born would have some show for labor. Let us hope that the South African "craze" will continue to expand; that the blood of the business world may get warmed up, and that California—and every other of our mining States—may be favored with a "coming crash."

ALMARIN B. PAUL, M. E.

San Francisco, Cal., Oct. 15, 1895.

Steel Chimneys.

Steel chimneys are attracting considerable present attention. It is claimed that they can well withstand destructive forces from within and without. On this subject a mechanical engineer says: It is surprising that a chimney constructed of so many pieces of burnt clay, laid together in a mortar that of itself has no tenacity whatever (the mortar of a brick chimney which has been heated and cooled a few times) should be preferred to a casing of steel and having a tensile strength of 60,000 pounds per square inch, securely riveted together and then solidly bolted through to the bottom of the foundation, and so stable indeed, that if pulled upon from the top it would upset from the very bottom of the foundation before it would noticeably bend through the length of the long shaft. The ordinary brick stack has to be considered as having a possible failing point at every joint, and should be calculated in its successive steps of thicker to thinner walls to determine the point of least stability.

A STEEL CHIMNEY.

In "Rankine's Applied Mechanics" the stability of a 455½-foot stack in Scotland is given, which shows the stack to have a resisting strength only four pounds above the highest registered wind pressure in that locality. Some parts of the stack were stronger, but as a whole it was to be relied upon to stand only to the limit of strength of its weakest part.

The stack illustrated was built by the Philadelphia Engineering Works, Ltd., of Philadelphia, Pa., for the Hartman General Electric Co., of Duluth, Minn. It is 7½ feet in diameter and 200 feet high. The General Electric Company of Cleveland has such a chimney 226 feet high, and, from an engineering standpoint, is in every way satisfactory.

Reasonable Geology.

By FREDERICK DANVERS POWER, F. G. S.

Man is a reasoning being, and applies his reason to elucidate obscure things. Sciences owe their existence to logic, without which they would be a mere jumble of observed facts gathered together haphazard. There is no science that requires the assistance of man's reasoning power more than geology, the practical outcome of which is mining; and yet, since the death of alchemy, there are, perhaps, few sciences in connection with which we hear such crude and absurd arguments. I do not refer to the trained scientist, who has done as good work in connection with the comparatively new science of geology as he has in connection with allied subjects, but to the pseudo-scientist, who allows his imagination to run riot with the one or two facts he possesses, till even he is unable to distinguish fact from fiction. Such ill-formed people, judging a whole by the few bits of badly digested knowledge they possess, do incalculable harm by promulgating false ideas, and bring ridicule to the subject of which they constitute themselves champions. Every miner, notwithstanding his frequently avowed objection to theory, attempts to form one, when confronted with unusual phenomena, as soon as he has two ideas to put together. Frequently they put the cart before the horse, and begin to theorize before they have collected the necessary data for their work; and as this data comes to hand, they endeavor to make it fit their views rather than make their theory fit the facts. There are others again who, from an inherent desire to prove that things are not what they seem and have been accepted to be for generations, attempt to throw doubt on the simplest phenomena, thereby obscuring rather than throwing light on the subject. Some people seem to think that we have come to the end of all knowledge; that they know everything which is worth knowing; and that any information others possess which they have not is of no value. This tends to cast discredit on learning and to discourage enlightened investigation. Statements are often made that have no foundation in fact, and these are handed down from one to another, each adding to or subtracting from the original story to suit his individual taste, till at last some purely fanciful description of a phenomenon, which possibly being past cannot be checked by later observations, finds its way into print for *savants* to puzzle their brains over in the future and to reconcile with modern views as well as they can.

The origin of an ore deposit has a direct bearing on its probable permanency and richness. It will thus be seen that it is highly important to the miner that he should know the true cause of his lode and the source of the ore, not only to assist him in developing the deposit, but also in searching for similar ores.

Much misunderstanding has been caused by the improper use of words. An illiterate person hears a technical expression, and thinks he will raise himself in the estimation of his fellows by using the same, which he takes the first opportunity of doing, in many cases placing the wrong construction on it. Maybe his mates catch at the word as being quaint, and perpetuate its false meaning until in time the new interpretation is generally accepted, owing to its common usage, and then we have one more opportunity of confounding different ideas that are expressed by the same word. A word with two distinct meanings is really two words. An apparently genuine but really illogical argument is often caused by the use of ambiguous terms, which possess different meanings in different localities—for instance, "black jack" may mean zinc blende, cassiterite, tourmaline, menacinite, chromite or almost any blackish mineral the miner is unable to supply with its proper specific name. To a mineralogist the term "black jack" simply implies that the substance belongs to a number of bodies that possess one property in common, viz., blackness, and that property may happen to be an accidental and not a characteristic one, for cassiterite may be black, brown, red or gray; tourmaline can be black, green, red, etc. But if the special name of the mineral referred to under the general term "black jack" was mentioned, then by the utterance of that word alone the mineralogist would understand not only the colors peculiar to it, but its chemical composition, physical properties, value, etc. The miner understands by the term "black jack" that mineral which is so designated in his own locality; and should some other be intended, then useless disputes are apt to arise, which would be avoided by employing less general words.

(To be Continued.)

The Miners' Convention.

(Continued from page 251.)

Pacific Railroad Company in the States of Idaho and Montana. This bill H. R. 8551 was introduced in the House of Representatives by Mr. Congressman Caminetti, a copy of which is marked Exhibit A and made a part hereof. It being found impossible to successfully prosecute this matter to a conclusion at that session of Congress, it was finally concluded before the close thereof, to introduce a bill H. R. 8963, to add a new section to what is now known as the "Idaho-Montana Act," approved February 26, 1895, to be known as section 9 of that act, making all the provisions of that act applicable as far as possible to the State of California. This bill also failed of passage. A copy thereof is made a part hereof and marked Exhibit B.

The expense attending these proceedings was about $625.

During the pendency of these proceedings the committee employed Mr. J. R. Moran, a competent engineer, to prepare for it a map of the State of California, showing the relative position of the railroad grants and the probable boundaries of the mineral belts. This map contains much data bearing upon this subject never before collected. The cost of this map is $700.36.

This committee, finding that all efforts to secure Congressional action touching the preservation of the mineral lands of this State were unavailing, made preparations to file protests against all railroad lists of selections, as they would from time to time appear in the several newspapers of the State under the provisions of the rules and regulations of the Department of the Interior, dated July 9, 1894. In consequence of the vague and indefinite form of the advertisements which appear in that regard, it is impossible to gather therefrom a knowledge of the exact number of acres involved in the protests which have been filed in behalf of, and as the work of, this association by Messrs. Edward H. Benjamin and William C. Ralston, but this committee has positive knowledge that at least six hundred thousand acres are involved, and it believes that the aggregate acreage will amount to somewhere in the neighborhood of one million acres. As these protests are substantially similar in all respects, a copy of only one thereof is made a part hereof, and marked Exhibit C.

The expense attending these proceedings is about $300.

Protests involving nearly six hundred thousand acres, filed in the name of Edward H. Benjamin, have been dismissed by the Commissioner of the General Land Office on the ground that the character of each forty-acre subdivision included therein was not specifically shown. Appeals from these orders of dismissal were taken in due time to the Secretary of the Interior, allowed, and are now pending before him, all briefs on both sides being now in; but unless these cases are expedited or advanced upon the calendar of the Secretary's office, they will not be determined for, say, something like eighteen months or two years from this time. A copy of appellant's opening brief, a copy of the answer of the appellees, and a copy of the appellant's reply, are made a part hereof and marked respectively Exhibits D, E and F.

It is perhaps proper in this connection to state that the chairman of this committee was appointed by the Executive Committee in the latter part of March, 1895, to proceed to Washington, and take such steps as he might see fit, either in the Department of the Interior, or before the President of the United States, touching these matters. The matter was finally laid before the President of the United States directly, both by oral and printed argument, to the latter being attached a photographic copy of the map of this State, made by said Moran. A copy of said printed argument and a photographic copy of said map are made part hereof, marked respectively Exhibits F-1 and F-2. At that time the President of the United States personally assured your said representative that he would take due action in the matter, and to that promise may be attributed the present status of what are commonly called the "Benjamin Appeals," it having been hitherto contrary to the practice of the Department of the Interior to grant appeals to a protestant, particularly from an order denying a hearing such as made in those cases.

The expense attending this trip was about $1650.

At the suggestion and by the request of the Executive Committee of this association, this committee also caused the printing, under its supervision, of what is commonly known as "An Appeal to the Miners of California," containing some forty-five pages of printed matter, which clearly set forth from official documents and other sources the status of the mineral lands, and the necessity for pecuniary aid from those interested in the subject, a copy of which said pamphlet is made a part hereof and marked Exhibit G.

Five thousand copies of this pamphlet cost $120.

Also, at the suggestion and by the request of the said Executive Committee, "An Appeal to the People of California" was also printed, a copy of which is made a part hereof and marked Exhibit H.

Five thousand copies of this pamphlet cost $7.50.

Also, at the suggestion and by the request of the said Executive Committee, this committee prepared and caused to be printed, under its supervision, a circular addressed to the miners of California, calling their attention to the necessity and propriety of filing individual protests against railroad selections, a copy of which said circular is made a part hereof and market Exhibit I.

There is also made a part hereof a copy of the form of protest, prepared and printed under the supervision of this committee, and referred to said circular Exhibit I, and which is marked Exhibit J.

The expense connected with this matter amounts to $297.30.

That since the 20th day of August, 1895, there have been certain negotiations pending between this committee and W. H. Mills Esq., as land agent of the Central Pacific Railroad Company, touching an amicable adjustment of the questions which have arisen between this association and the land-grant aided railroads in this State in the matter of the examination and classification of the lands lying within the limits of their respective grants. A copy of the correspondence connected therewith may be found as a part of appellant's reply, Exhibit F. It will be noted therein that there is nothing to restrict either side to the proposed agreement from applying to Congress for appropriate legislation in the matter.

Mr. Edward H. Benjamin was appointed the commissioner to act for the association, provided that said agreement was consummated, and his selection for that position was thereafter approved by the Executive Committee of this association at its meeting on the 7th inst., with the restriction that he take no part in the classification and examination of such lands as may be embraced within the several protests filed by him in behalf of this association. Respectfully submitted,

A. H. RICKETTS, Chairman.
J. M. WRIGHT.
CHAS. G. YALE.
E. C. LOFTUS.
CHAS. H. HOFFMAN.

(The documents referred to in the above report have already received extended notice in these columns.) The report as read was adopted without discussion. Subsequently, by request, Mr. Ricketts read the last letter received, on the 11th inst., from Mr. W. H. Mills, relative to the proposed compromise, which had been received too late to be embodied in the report.

The hour—2 P. M.—having arrived, at which time it had been agreed upon to elect officers, A. Ames of Placer placed in nomination the present incumbent, Hon. J. H. Neff of Placer, who for the fourth time was the unanimous choice of the association for its president. Hon. Niles Searls nominated S. K. Thornton of San Francisco, the present vice-president, to succeed himself; he also was elected by acclamation. For secretary, Hon. C. W. Cross placed in nomination Julian Sonntag of San Francisco; C. Runckel of Placer nominated W. C. Ralston.

Mr. Ralston asked leave to make a few remarks and said:

As the question of my candidacy for the secretaryship of the Miners' Association for the coming year has received rather an undue prominence in the newspapers, some explanation of my position is due my friends. I have served as secretary of this association and the Executive Committee since its organization to the best of my ability, and a few months since concluded to retire from the position and give more time to my private affairs, thinking also that some new blood among the officers would be beneficial to the association. While in New York last month, I wrote to some of my friends that I would not be a candidate this year and so expressed myself upon my return to all who cared to know. My very good friend, our worthy president, had also announced his intention of retiring from his position. Quite recently very strong pressure was brought to bear upon Mr. Neff to reconsider his determination. It was found, however, that such active and intelligent workers on the committees as Messrs. Ricketts, Wright, Ford, Loftus, Yale and others also declined to serve in their respective positions again. Mr. Neff positively refused to let his name be used unless those whose loyalty to the association and the miners' cause had been proved to his satisfaction would continue to serve with him. There were rumors that the railroad companies intended to capture this association if possible, and a certain opposition to the course of the association was developed even among members of the Executive Committee itself, mainly, however, from a few who never attend its meetings or pay the slightest personal attention to its proceedings, except when they may serve some purpose of their own by so doing.

I was only one of those who were urged by Mr. Neff to continue with the work. At his urgent personal solicitation, and against my will, I promised him I would again become a candidate for the secretaryship. The only reasons why I did this were to please him and because I knew, as you all do, that no other man would make so good a president as he and that he would not serve unless we would also. It was for what he considered the good of the association that I, among others desirous of retiring, consented.

In the mean time, other gentlemen perfectly competent to fill the position, and actively interested in the association's affairs, had announced themselves as candidates, and I was placed in the unpleasant position of trying to continue in an office I did not want and keeping out others who might fulfill its duties better. It was only yesterday that Mr. Neff absolved me from my obligation to him and left me free to act as I desire. It is, therefore, with great pleasure that I can announce to my friends who may have intended to compliment me by their votes that I decline to be a candidate. I have this to say, however—that, while I shall no longer be an officer, my active interest in the affairs of the Miners' Association will by no means cease, and I shall endeavor in every way, as far as I can, to assist it. And I hope that the associations of my successor with the officers and committees will be as pleasant as mine have been within the past four years.

The remarks of all the speakers were applauded. As in the cases of President Neff and Vice-President Thornton, Mr. Julian Sonntag of this city was unanimously elected secretary of the association by acclamation for the ensuing year. For treasurer, Mr. R. Church of San Francisco nominated Mr. W. W. Montague, that gentleman receiving the same compliment as the others in a unanimous viva voce vote. The recipients of these honors each made a brief, sensible speech.

R. M. Clarken of Sacramento, chairman of the Committee on Resolutions, then read that committee's report, as follows:

REPORT OF THE COMMITTEE ON RESOLUTIONS.

MR. PRESIDENT: Your Committee on Resolutions have the honor to report as follows:

HYDRAULIC MINING.—*Whereas*, The injustice done to a great branch of the mining industry of this State, whereby thousands of people were ruined and millions of dollars' worth of property destroyed, still continue to exist, in spite of every effort made to bring them relief without injury to others, therefore be it

Resolved, That we believe that it was through one branch of the Federal Government that the hydraulic mining industry was prostrated and destroyed, so must it be through another branch of that Government that relief must speedily come.

Resolved, That this association urge and request our Senators and Representatives in Congress to use every effort to secure an appropriation so that, aided by the appropriation made by the State of California for the building of dams as recommended by the Congressional Commission, this great industry be revived without injury to the navigable streams if the State or to the farming lands adjoining.

Resolved, That we endorse the action of the California Debris Commission, believing that it is fair and impartial, and we also urge upon our Senators and Representatives to secure such an appropriation as will be necessary to carry out its work.

MINERAL LANDS.—*Resolved*, That we heartily endorse the efforts of this association's Committee for the Protection of Mineral Lands to maintain, free and open for exploration and purchase by the prospector and miner, the mineral lands of the State of California, and that a committee of like character be appointed by the president of this association, to continue the prosecution of the same work until Congress shall have passed some law for the classification of the railroad grant lands in this State, and that the work of said committee shall apply to all the railroad land grants within the State of California.

Resolved, That the Committee on Legislation, when appointed, be instructed to use all honorable means at its disposal to secure such congressional legislation as will provide a just and speedy settlement of the so-called mineral lands controversy now pending between this association and the railroad companies having congressional land grants within this State.

Resolved, That in contests between mineral and non-mineral claimants of land it is the sense of this convention that jurisdiction should be conferred on the local courts by Congress to determine the character of the land in controversy.

GENERAL RESOLUTIONS.—*Resolved*, That the thanks of this convention be extended to the press of San Francisco and this State for their earnest co-operation in making this convention a success.

Resolved, That the miners of California gratefully acknowledge the valuable assistance rendered to this association by the Board of Trade, Chamber of Commerce, and other organizations of San Francisco, for their strong, liberal and financial support, which has largely advanced the mining industry of California.

Resolved, That all committees of the California Miners' Association, report to the Executive Committee thereof all proposed action of said committees before finally acting thereon, unless otherwise authorized by the general convention, and that no act of any subordinate committee shall be considered as the action of the California Miners' Association until approved or authorized by the Executive Committee thereof.

Resolved, That until the next meeting of this association the Executive Committee shall have plenary powers to originate and decide upon all matters pertaining to the affairs of this association not in conflict with the express direction of the association in convention assembled.

Resolved, That this convention calls upon the various mining counties of the State to sustain a watchfulness over the investigations before the District Land Offices of their respective sections, and that they be requested to take such steps as shall prevent the railroad companies from procuring patents to mineral lands.

Resolved, That the thanks of the convention be extended to the Legislative and Mineral Land Committees, for their faithful performance of an arduous duty, and which needs such a continuance of the same intelligent activity to accomplish the end for which the miner is contending, the preservation of the mineral lands for the miner.

Respectfully submitted, R. M. CLARKEN, Chairman.

The report was adopted as read, following which E. H. Benjamin made report regarding his representation of the association at the Trans-Mississippi Congress.

The harmony and general good feeling that had prevailed during the first and second days of the convention's proceedings continued unbroken to the close. On Wednesday morning there was a diminished attendance, press of private business having summoned some of the delegates to their homes. President Neff announced the appointment of the following committees:

Executive Committee, At Large—W. W. Montague, C. W. Cross, H. Pichoir, T. R. Church, A. Carrigan, L. Sloss Jr., S. B. Christy, R. McMurray, E. Coleman, J. M. Wright, T. J. Parsons, D. E. Hayes, S. J. Hendy, T. L. Ford, R. E. Browne.

Additional by counties:

Alameda—A. H. Ricketts, C. G. Yale.
Amador—J. F. Parks, J. R. Tregloan.
Butte—A. Ekman, W. E. Duncan.
Calaveras—T. T. Lane, F. F. Thomas.
El Dorado—J. J. Crawford, J. Richards.
Mariposa—A. Wartenweiler, T. Couch.
Nevada—F. Zeitler, J. M. Walling.
Placer—H. T. Power, F. Chappellet.
Plumas—G. Standard, W. W. Kellogg.
Sacramento—J. Batcher, J. H. Burnham.
San Francisco—E. A. Belcher, W. C. Ralston.
Shasta—R. G. Hart, C. W. Fielding.
Sierra—F. R. Wehe, D. T. Cole.
Santa Clara—R. R. Bulmore, C. C. Derby.
Siskiyou—A. G. Myers, J. Farraher.
Trinity—J. McMurry, D. G. Reid.
Tuolumne—E. C. Loftus, J. W. C. Maxwell.
Ventura—J. B. Treadwell.
Yuba—J. O'Brien, L. Courath.

Committee on Legislation—T. L. Ford, J. M. Wright, E. A. Belcher, A. H. Ricketts, J. McMurry, G. I. Taggart, R. E. Browne, W. W. Kellogg, C. F. Hoffman, R. McMurray, D. G. Reid, F. R. Wehe, H. Craig, T. J. Parsons, E. Coleman.

Committee on Preservation of Mineral Lands—W. C. Ralston, A. Carrigan, C. F. Hoffman, E. C. Loftus, W. R. Thomas.

Some vigorous addresses were made, among others by Congressman Magnire, who said:

I have always been in full sympathy with your purposes from the beginning. I have at all times endeavored, as far as my ability and knowledge allowed, to aid you and your representatives in securing and promoting justice for you.

The great question now absorbing the people of the mining districts is the effort to prevent the Central Pacific Railroad Company and its successors from obtaining possession of the mining lands of the State under a grant which did not include mineral lands.

Whatever I can do to prevent the carrying out of this plan by the railroad I shall be pleased to do on every occasion and at every opportunity when in Washington or here. If I can serve you here in the accomplishment of that purpose and prevent the injustice which I believe is now being put on the mining people, you may call on me, and you may rest assured that I will do whatever I can to aid you and your cause. I want you to feel that you may freely call on me to protect your interests, for on this particular matter my mind is fully made up and my course settled.

W. W. Kellogg of Plumas submitted the following resolution:

Resolved, That it should be the policy, as it is the duty, of the General Government to preserve and protect the mineral lands belonging to the Government from being patented or conveyed to railroad or other similar corporations; that such lands should always be open for prospecting, working and developing, and by individual companies or corporations organized for mining purposes alone, and that when a contest to an application for grants of land by the Government to said railroad companies arises as to the character—mineral, agricultural or timber—of such lands, the General Government should, as a matter of right and justice and for the benefit of the country and citizens generally, pay all the expenses incurred before any of the departments.

The resolution was adopted as read.

Railroad Commissioner La Rue, a delegate from Sacramento, said:

I am with you in this fight against the great corporation that has throttled the people of this State in all directions. I believe that all mining lands should be as free now as they were in 1849. The railroad should be curbed. God knows, they have enough. I am engaged in a similar fight to yours. It is not, however, a fight against the railroad as it is for the people of the State.

In a happily worded speech President Neff presented ex-Secretary Ralston with a handsome token

of the esteem in which he was held by the association in the shape of a solid silver table set—a magnificent gift—which was accepted and responded to in graceful phrase by the recipient amid applause.

A. Carrigan, L. Sloss, Jr., and T. J. Parsons were appointed members of the Auditing and Finance Committee.

W C. Ralston offered the following, which was unanimously adopted:

WHEREAS, Charles G. Yale was the founder of the California Miners' Association; as now constituted, and whereas he has rendered invaluable services to the association at all times since its organization as an editor, earnestly and intelligently urging measures for its advancement, as a writer for the daily press fearlessly and consistently making its contests, and as a diligent worker upon its various committees; therefore

Resolved, That the gratitude of the California miners is due to Charles G. Yale for his past services, and that its thanks be hereby tendered to him; and

Resolved, That the secretary of this association be and he is hereby directed to furnish the said Charles G. Yale with an engrossed copy of these resolutions, the same to be duly attested by the signatures of the president and secretary of the association and by the impression of its seal.

President Neff then made a brief but impressive address, congratulating the association on the harmonious and successful termination of the convention and again directing the attention of the several county organizations to the need of constant zeal in the advancement of the interests of the State association and the procurement of necessary funds to enable the central organization to carry on the work. The delegates gave three hearty cheers for their chairman and the convention of '95 adjourned to meet next year or at the call of the Executive Committee.

Concentrates.

ARIZONA papers report the sale of the Congress mine.

THE present New York quotation for platinum is $12 per ounce.

THE office of the Union Iron Works has been removed to 222 Market St.

NEARLY $25,000 was distributed among Nevada City working miners last Saturday.

WITH copper at 12¼ cents, it looks as though the old Union mine at Copperopolis could be made a paying producer.

DURING 1894 the United States produced $6,829,260 more gold than silver, taking silver at its commercial valuation.

THE Boston mine, twenty-five miles northeast of Visalia, is being reopened by Visalia men, who have bonded the property.

THE *Inter-Mountain* says every time copper goes up a cent a pound Butte receives the benefit to the extent of $2,000,000 a year.

THE Gwin mine shaft is now down 1030 feet, the station has been put in and preparations are being made to start the 1000-foot level.

SEPT. JUTTON will add ten stamps to the 10-stamp mill now running at the Pine Log mine, operated by the Royal Mining Co., near Copperopolis.

R. C. WALRATH and Col. Stone have control of the old Flag mine, twelve miles from Marysville, will put on powerful pumps and operate the property.

TO DATE the par value of South African gold mining investments aggregates about £50,000,000: the selling price is nearly one billion dollars—an enormous bladder.

THE Omaha & Grant Smelting Co. have bonded the Ruby Silver, Slocan, B. C., for $7500, and the Ajax and Treasure Vault claims, situated near the Noble Five.

ONE HUNDRED MEN are now busy building the smelter at the Silver King mine, B. C. E. I. Parsons, of this city, is superintending the building of the tramway.

THE result of the recent clean-up at the Harmony mine, Nevada county, was a bar of bullion worth $10,000, the product of a run of twenty-four days, $7000 of which is profit.

ELEVEN gold claims in the Big Bug, Arizona, district have been bonded for $50,000 by J. E. Ralston of Chicago, who will put up considerable machinery, including a 10-stamp mill.

THE Secretary of Mines for the colony of Victoria reports that the gold production of that colony in '94 was 673,680 ounces—an increase of 2554 ounces over the output of '93.

RIEHL, MONTCURE AND GILLETT, Palermo, Cal., have tunnelled 250 feet on a promising ledge, are sinking a shaft, and believe the prospect justifies the purchase of a 5-stamp mill.

GOLD is becoming an important staple of British Guiana. From 250 ounces in 1884 the production has increased to 138,000 ounces. It is obtained at present chiefly by placer mining.

"TIME CHECKS" are making trouble at the Trail, B. C., Reduction Works. Time checks and the resultant scalping nearly always make trouble between employers and employed.

THE *Australian Mining Standard*, published at Sydney, one of our most valued exchanges, has been purchased by Mr. F. Critchley Parker, who will hereafter issue an illustrated journal.

CANE & GRAYSON, of Stockton, have bought the Carlyle mine on the south fork of the Feather, near Forbestown, will build a wagon road from Enterprise, and put machinery on their property.

BY good management and close economy, the quicksilver mining companies are enabled to pay monthly dividends. The recent fluctuations in the price have resulted in a present quotation of $40 per flask.

LAST week in Spokane, Wash., the Cedar Canyon Mining Company, capital $200,000, incorporators, W. A. Crawford, J. A. Cameron, I. L. Vanhorn, and the Homestake Consolidated Mining Company, capital $500,000, incorporators, W. L. Blossom, F. E. Elmendorf, C. N. Cheney and A. Townsend, incorporated.

THE Redding *Free Press* says it has good authority for the statement that R. G. Hart has refused $800,000 for his mine at Old Diggings, Shasta county. Mr. Hart evidently knows when he has a good thing.

LAST Wednesday the regular monthly double dividend of the Centennial-Eureka, amounting to $1 per share, or a total of $30,000, was declared and paid, which brings the total of the company up to $1,350,000.

THE United States assay office at Helena, Montana, last week shipped $135,101 worth of gold bullion to the Philadelphia mint, the largest shipment ever made from Montana, and entirely a State product.

OF the Simmer & Jack mine, Witwatersrand district, S. A., John Hays Hammond predicts that by the time the 280-stamp mill is in operation, enough paying ore will be in sight to keep it running profitably for thirty years.

THE Buckeye, Nev., group of placer mines, twenty-seven miles from Carson, Nev., is sold to Charles Lane of the firm of Lane, Hayward & Hobart of this city, for $200,000. Water will be brought from Alpine county, this State, at a cost of $100,000.

THE Poorman Gold Mining Company has incorporated at Spokane, Wash. The property of the company is located in British Columbia; capital stock, $500,000; incorporators, J. A. Coram of Lowell, Mass.; C. H. Palmer and C. S. Warren of Butte, Mont.; P. Clark, W. J. C. Wakefield, S. I. Silverman and J. A. Finch of Spokane.

W. Q. BROWN AND J. L. SCOTT are getting out 15 tons, or a carload, of nickel ore at Riddles, Or., for shipment to the Chicago smelter. The new Nickel Mine Company, recently organized at Grand Rapids, Mich., will make a thorough test of the ore, and on the result will be based the development and operation of that property.

THE incorporation of the South Paloma Gold Mining Co. includes the two claims formerly known as Gwin Extension and Roach mine. The claims are situated immediately south of the Gwin mine in Calaveras county. The company has opened up the old Roach tunnel eighty feet and is preparing to put in a prospect shaft 5x7.

THE owners of a number of placer claims on the Colorado river, a few miles south of Green River, have sold one claim to Denver men for $2300, exacting from the purchasers an agreement to erect a plant of daily capacity of 500 yards of gravel. Their object is to demonstrate that the fine gold along the river at this point can be profitably handled.

WILLIAM SUTHERLAND, who has charge of the process for working the tailings at Candelaria, Nev., says that the work of bringing the water into the town and to the mines and mill has been completed. There are only ten men now employed, but as soon as the new machinery ordered has been put in place the force will be largely increased and the work begun in earnest.

E. C. HARD of the Terry Hill mine, Spanish Ranch, Plumas county; Will de Vining, Lone Star mine, Kromberg, Plumas county, have been granted hydraulic mining permits by the U. S. Debris Commissioners. Permits to construct impounding works were given this week to the York Mining Company, Brownsville, Yuba county, and James Chapelain, Rackerby, Yuba county.

GREAT BRITAIN'S mineral statistics' blue book for '94, received, shows an increase over '93. The only British gold field yielded 4235 ounces, valued at $74,005: of copper, 446 tons were produced, worth $100,000: of iron, 3,347,472 tons, worth $50,000,000: of silver, 275,696 ounces, worth $175,000: of tin, 8327 tons, worth $3,000,000. The amount of coal mined was 188,277,525 long tons, valued at £62,730,179.

IN answer to sundry inquiries, the general statement is made that the owner or owners of a group of adjacent mining claims can put all the required annual assessment work on any one of the claims, provided that there is joint ownership in all the claims, or, in the case of individual ownership, that one person has all the claims: provided, further, that the work so done can be shown to apply to the proper working or improvement of all the claims in question.

OF Arizona Gov. Hughes says: During the year ending June 30, '95, the gold output was $4,260,000, an increase of $2,179,750 over 1894, and four times as much as in 1893. The silver output was 1,750,000 ounces, a decrease in value over last year of over $500,000. The copper production amounted to 42,661,239 pounds, valued at $6,207,611, and the lead output amounted to $350,000. The total value of bullion exports was $11,955,111.

A COMPANY has been organized to furnish electric light and power for the mining camp of Bingham, 25 miles from Salt Lake, Utah. The company also proposes to apply electricity to the precipitation of copper known to exist in the springs at Bingham. A number of experiments have been conducted, producing a precipitate 45 per cent. copper. The Bingham springs are also said to contain nickel and silver in solution, and the experiments will be continued with a view to saving these metals.

MINT DIRECTOR PRESTON has unofficial information from Russia to the effect that the gold production of Siberia would this year largely exceed the output of last year, when Russia produced $25,000,000 in gold. He estimates the gold production of the world this year at more than $200,000,000, and that of the United States at $46,000,000, being an increase over last year of about $6,000,000. It is thought probable that for the first time South Africa will show a larger annual return than California.

FOLLOWING are late Washington mining incorporations: Main Quesnelle Gold, Dredging & Mining Company; capital, $250,000; incorporators, R. Thompson, E. J. Fader, H. K. Read, F. B. Fox. Montana French Gulch Mining Company, Tacoma; capital, $24,000; incorporators, M. J. Gihlin, H. A. Young, E. C. Mohler, N. J. Brazell. Cedar Canyon Mining Company, Spokane; capital, $200,000; incorporators, W. A. Crawford, J. A. Cameron, I. L. Vanhorn. Homestake Consolidated Mining Company, Spokane; capital, $500,000; incorporators, W. L. Blossom, F. E. Elmendorf, C. N. Cheney, A. Towne.

LONDON *Mining World* wonders in its current issue if its readers have heard of the new trust formed by the New South African Group. Its name is Africana, Limited, and its capital one million sterling. It believes the shares will be brought out at 3?s 6d, which at once puts the capital up to nearly two millions. "Notwithstanding this, the New African people have been so successful, and withal so ably represented, that of all the new trusts that have been floated and which are to be floated we believe this one, especially in Paris, will be received with the greatest favor."

THE Secretary of the Interior has approved grants of lands to the Oregon and California Railroad Company, as successor to the Oregon Central Railroad Company, List No. 16, including 46,091 acres; to the same road, List No. 17, embracing 12,349 acres within the limits of the Oregon City's land district; to the same road, List No. 14, containing 1630 acres; Southern Pacific Railroad (main line), List No. 25, 1152 acres; Southern Pacific Railroad (branch line), California, 206 acres, and 72,130 acres to the Central Pacific Railroad Company, as successor to the California and Oregon Railroad Company.

IN the State of New Jersey there are spots where vast quantities of timber have lain for ages, which, when dug out of the ground, is found to be intact, and, to all intents and purposes, firm and sound as if it were recently cut for building purposes. In regard to its origin, the theory is that a vast timber forest was laid low by some conflict of nature, and then covered up by an upper stratum of earth, which has succeeded in preserving the trees, the first of which was discovered some years ago. It is interesting to note that the system of mining consists in first locating the tree with a rod, and then digging along its length, and by filling the trench with water, causing the tree to rise. Some of the trees are said to have been discovered at a depth of eighty feet.

T. S. CHAPMAN, who has spent three years in visiting the principal mining camps in Mexico and British Columbia, observing the different methods of treatment in vogue, for the purpose of getting some idea as to the process best adapted to his peculiar kind of ore, says one of the best he has ever seen is employed in Mexico, in a gold mine 200 miles from a railroad, reached by mule train, and is as simple as it is satisfactory. The ore is ground very fine and is then roasted in salt and sulphate of copper, the salt freeing the gold and the sulphate of copper creating in the rust-covered particles an affinity for the quicksilver. He says it has been in use at that place in Mexico as long as the stamp mills have been in that country, with success. The rock must be finely pulverized, 100-mesh fineness being required.

A GOOD showing of the mining wealth of the province of Ontario is given in the fourth report of the Bureau of Mines for the year 1894, sent by Archibald Blue, Director of the Bureau, Toronto. The volume contains 261 pages, and is accompanied by maps of parts of the Rainy River district, geologically colored. While the extent and variety of mineral deposits in Ontario are considerable, the mining development has been retarded by the general financial depression, but the possibilities of profitable working appear to be great and the director naturally expresses regret that the people of Ontario do not yet appreciate them. The value of the mineral production in 1894 is stated at $6,086,758, the number of employes as 6075 and the wages amounted to $1,840,289. The largest items in the list are petroleum and its products, natural gas, nickel, copper, brick, stone, lime, tile, sewer pipe, pottery sand, gravel and salt. A small amount of gold was produced. Iron has no place in the table of productions; the last attempt to produce pig iron in Ontario was made as long ago as 1854. An iron furnace is nearly completed at Hamilton, after many delays and misfortunes, and good results are expected from the enterprise. A section of the report is devoted to "the Hinterland of Ontario," the vast region reaching from Lakes Huron and Superior on the south to the Albany river and James Bay on the north, with the boundary line of Quebec on the east and its western limit Rainy river and Lake of the Woods, containing an area of about 140,000 out of the 200,000 square miles of Ontario. An elaborate and instructive paper on "Calcium Carbide and Acetylene Gas" forms another section of the report, and others are devoted to an account of diamond drill explorations, nickel and its uses, etc.

CHARLES JEFFERSON CLARK, a California miner, who, like a good many other California miners, has won fame and fortune in South Africa, has written a letter to a friend of his in this city, in which he tells of what is being done in his jurisdiction. Incidentally, he orders about $30,000 worth of California mining machinery, to be shipped from here to New York, thence to Buluwayo, South Africa, via Port Elizabeth. When it arrives at the end of the railway at Mafeking it will have to be hauled a little matter of seven hundred miles on ox wagons. He has considerable business on hand, but not enough to forget his old acquaintances. In his letter he desires to have the MINING AND SCIENTIFIC PRESS sent to him, wants some California canned fruits, Pacific iron frame mills, and prices and circulars for all classes of redwood timber, redwood shakes, etc. He has also bought considerable mining machinery through Fraser & Chalmers, London, and sends for a 20-stamp mill every week or so. He says: "Harry Webb is over here and is stopping at my house with me. I send you by this mail a paper giving an account of our stand sale here, which brought tremendous prices. Our place is booming, and anyone can make money here who has capital. You will see I bought a stand for $15,000, and will start immediately to build an opera house which will cost $150,000. On Friday I organized the Buluwayo Ice & Cold Storage Co., and shall cable to New York to-morrow for a two-ton ice machine. I only wanted $20,000 for this and got $26,000 subscribed for it in four hours. I have also just floated the Rhodesia Ancient Ruins Co. You will see a notice in the paper I send of a wonderful find of gold ornaments by some parties who are in our new company. I bought the gold from them and paid them $15,000 for it. I have an enormous amount of work to do; have charge of some very large mines, have a large staff of engineers to assist me, and will soon commence a handsome building of our own for offices. I am very badly in need of good, wide-awake foremen and assistants, and almost any number of first class miners could get employment here. We pay them nineteen shillings per day, and their board costs about $35 per month. My old foreman, Tom Burke, is my superintendent in the biggest one of the districts of which I have charge, and old Jack Findlay is out prospecting. There are a number of Californians here and more coming all the time. I went down to Johannesburg about a month ago, and saw Jack Hammond and Sam Connor. Sam is making money. Hammond has made about $750,000, and Wiltsee has just cleared up $50,000 in cash, which he has put in the bank. George Starr is consulting engineer for Barney Barnato, at $25,000 a year, so you see Californians have not taken a back seat in Africa." A good many readers will be glad to hear of Mr. Clark's merited success

Scientific Progress.

Terrestrial Helium.

The announcement by Professor Ramsay of London last April that he had discovered in a terrestrial mineral a substance giving the same spectrum as the substance called helium, and detected up to that time only in the sun and a few stars, was received with some skepticism at first; and, in spite of much corrohorative testimony from independent sources, English scientific publications continued for months to use an interrogation mark, implying editorial doubt, after all headlines referring to the matter. The most serious objection to accepting the genuineness of the supposed discovery was raised early in May by Professor Runge of Hanover, Germany, a recognized authority in spectroscopy. This investigator declared that he and an associate had discovered that the yellow line found in the spectrum of the gas in question was double, whereas the D 3 line had always been referred to as a single line. Rowland, whose tables of wave lengths of the solar spectrum is now generally accepted as the standard, so gives it. Professor Runge, therefore, insisted that, until it was proven that the true helium line is double, the identity of the new-found gas with the peculiar constituent of the sun's chromospheric layer could not be cousidered as established.

During the summer, however, evidence has heen accumulating which removes all doubt on this point. Professor Hale of Chicago, whose lahors iu solar spectroscopy have attracted world-wide attention, finds that the D 3 line really is double; and his measurements of the positions of the two components correspond with those made by Professor Crookes, in England, in the spectrum of the terrestrial gas. Professor Young of Princeton declares that he has not himself noticed the duplicity of the line, in his own chromospheric observations, hut that his assistant, Taylor Reed, has done so on several occasions. At the recent meeting of the British Association for the Advaucement of Science, the president of the chemical section, Professor Raphael Mendola, treats the main question as now definitely settled and pronounces important an incidental problem raised by recent study of the subject.

Almost immediately after his first discovery of helium, Professor Ramsay suggested the possibility that this gas and argon might hoth be composite substances, having one constituent in common. Certain coincidences between the spectra of the two warranted a suspicion of this kind. Professor Lockyer has since obtained, from the mineral broggerite, helium giving not only the principal line (5875.98), hut also the line 4471, which Young cites as occurring in the spectrum of the chromosphere with the same frequency as the other. But when Lockyer experiments with his terrestrial gas, these and other helium lines (especially 6678.3) act dissimilar under a change of temperature instead of all changing simultaneously in brilliancy. This, in Lockyer's judgment, shows that the gas is not a single element, hut a mixture. M. Deslandres, perhaps the most distinguished of French solar spectroscopists, has also discovered a new and strong line in terrestrial helium, at 7065.5, and this corresponds with a line which he has found in argon. As yet the research has not heen pressed far enough to be conclusive, but Ramsay's suggestion has already found partial confirmation.

The new process for the manufacture of white lead by electricity will work a revolution in the white-lead industry. Instead of acetate of lead, as in the old process, sodium nitrate is used together with sodium hicarhonate. A number of cells are filled with the solution, with plates of lead at one pole and of copper at the other. The current from a dynamo causes nitric acid to be liherated and to combine with the lead. A number of reactions occur, with the final production of white lead in a very fine and uniform state and of superior coloring quality. The chemicals can be reused indefinitely. As many as 500 pounds have already been made at one charge.

Huxley's Adherence to Science.

To him indeed, it may be said, science was all in all. He saw, as others see, in science a something which is broadeuing and strengthening human life by unceasingly bending nature to the use of man and making her resources subservient to his desires; he saw the material usefulness of science, but he saw something more. He saw also, as others see, in scieuce a something in which the human mind, exercising and training itself, makes itself at once nimble and strong, and dwelling on which is raised to hroad and high views of the nature of things; he saw in science a means of culture, but he saw something more. He saw in science, even as it is, and still more in science as it will be, the sure and trustworthy guide of men in the dark paths of life. Many a man of science goes, or seems to others to go, through the world ordering his steps hy two ways of thinking. When he is dealing with the matters the treatment of which has given him his scientific position, with physical or biological problems, he thinks iu one way; when he is dealing with other matters—those of morals and religion—he thinks in another way. He seems to have two minds and to pass from the one to the other according to the subject-matter. It was not so with Huxley. He could not split himself or the universe into two halves and treat the one and the other half by two methods radically distinct and in many ways opposed. He applied the one method, which he believed to be the true and fruitful one, to all problems without distinction.—Professor Michael Foster in the Popular Science Monthly for October.

A German chemist has made the discovery of a new compound body, which is said to possess the peculiar quality of solidifying under the action of heat, aud to again revert to the liquid state at a temperature below 32° Fahrenheit. To this substance the name of "crostase" has been given, and it is stated to be ohtained by mixing equal parts of phenol, camphor and saporine, with the addition of a smaller proportion of the essence of trehenthine. It is supposed that, up to the present time, nobody possesses this remarkable property of liquefying when cold and solidifying when hot. Certain substances, such as albumen, harden when exposed to heat: but once they have attained this condition, they cannot he made to resume the liquid state, although they may be subjected to exceedingly low temperatures.

Mechanical Progress.

Tempering Steel.

The following points on tempering steel are uoted by an experienced mechanic:

Every toolmaker has a way of his own of working and tempering steel. Either he has a particular way of heating or a special way to anneal, or perhaps these may uot seem as important as the cooling mixture used in hardening; yet, to some one or all of these he attributes his usual success. He will listen respectfully to other ways of working and agree that you have been very successful, hut thinks that your last job that cracked or warped could have been saved if you had done it his way. There is prohably more reason in his method than we who have our particular way are willing to admit. It is not, perhaps, so much in the treatment he gives the steel as the fact that he has a system and adheres to it, and having found a brand of steel suited to his work is able to secure good results. This is a much better way than a haphazard method of working, hut a knowledge of the characteristics of steel and the principles governing its successful use will enable the workman to get more uniform results, especially if there is much variety in his work.

Probably the most serious injury to which a piece of steel is liable is in the heating, either for annealing or hardening. As the annealing is the first operation after the piece is cut from the bar, we will consider that first.

A charcoal fire is desirable, but probably most of the steel used is heated in a soft coal fire, and if the coal is well coked results equally good can he ohtained. It would make no difference which is used if there were no sulphur in the coal, which seriously injures steel. Coke contains so little that no harm can result, as it could only spoil the outside, and that is already damaged by the work done in the rolling mill and will be removed in the machining of the piece. In any case the fire should be large and deep enough under the work to prevent jets of cold air from coming up through the coal and causing uneven heating. A slow and even heat is absolutely necessary. Have the fire well lighted and glowing evenly (hut not hotter than a hright red), and reduce the blast before putting in the steel. This will give a mass of coal that will heat the work from all sides about alike. If the heat is fierce the corners will get hot too soon, and probably too hot hefore the middle is hot enough. There is not much danger of heing too slow in the heating if the fire is even and large, although steel should never be allowed to "soak" in a firc. The heat should enter the piece steadily, as much heing taken in one second as entered the second before, and will in the succeeding one.

Be very careful not to overheat the work. If hot enough to harden it is hot enough to anneal. To heat more is to make the steel granular and brittle. Don't handle the work with cold tongs, or expose it to the air auy more than can be helped, as the success of the annealing depends on making it cool very slowly. It hegins to cool the instant it is removed from the fire, and then is the time to keep the heat in. This is all the more essential if the above caution against overheating is observed, as you have no heat to waste. Powdered lime, wood ashes, etc., are good to hury the piece in to prevent rapid cooling. Perhaps the ideal would be red hot asbestos, but ashes are more common, and if properly used are good enough. Wood ashes are better than coal ashes, probably hecause they are lighter and do not conduct away the heat so quickly. A very good mixture is dry sawdust and ashes mixed; the sawdust will take fire, and smouldering for a while will keep the work hot. Whatever is used it must he heated before the steel is put in, as the steel in warming up the ashes will cool quickly enough to make the subsequent slow cooling useless. It is the time taken for the temperature to fall from the heat necessary to harden to that indicated by a dull red that determines the softness of the steel.

J. E. Masters and John L. Huhhard, blacksmiths in Hall Bros.' shipyard at Port Blakeley, Wash., have succeeded in welding copper and iron or steel—a process the accomplishment of which has for centuries baffled the most skillfull mechanics of the world. They say: "What we have done is simply to secure a perfect welding of a sheet of copper and a sheet of steel. To what practical applications the work may he put, neither of us can surmise." They show a plain sheet of two metals, so perfectly united that they seemed but parts of an indivisible whole, copper on one side and steel on the other. The sheet is about 2.5 hy 3 inches, with an average thickness of $\frac{1}{8}$ of an inch. While it shows a complete welding, yet a tranverse section shows plainly the line of distinction between the two metals, clinging together with such cohension that no sledge hammer or cold-chisel has been able to separate them. They are satisfied that what has been done thus far ou a small scale can be easily done on a larger. They have not yet protected themselves by patent, and of course guard the secret of their method with the greatest care.

Electrical Progress.

The Monocyclic System in Salt Lake, Utah.

The monocyclic system developed by the General Electric Company is ahout to be used in Salt Lake City, the distribution heing made on the three-wire secondary method from large transformers. Most of the lighting will be confined to a space covering ahout six hlocks, and as the hlocks in Salt Lake City are 800 feet square, the territory covered is somewhat large. A branch line will run from one corner of the district for ahout a mile along the best residential street, while another line will run out from auother corner of the district for about 1500 feet to the county and city huilding. These lines will be gradually extended over other parts of the residential district as soon as the demand for such an extension arises.

The station will he located on the railroad track, 3000 feet from the nearest side of the rectangular district of six hlocks, and 4800 feet from the farthest side.

The generating plant will consist of two 150 K. W. 2000-volt monocyclic alternators, helted directly to two steam engines. As the large blocks are more or less open, the center space being occupied by stores, harns, etc., room is thus afforded for the pole lines for the secondary wires around the inside of the hlock. From these service wires will he run into the rear of the huildings. The plans contemplate the installation of two 3-wire transformers to each hlock, one on each side of this interior court and the 3-wire secondaries running around the court will be directly supplied from these transformers. As the uumber of lights in the hlock is increased, the transformer equipment will be expanded.

For lightiug the residential district from the branch lines, the usual course of using small transformers will be followed, bunching them as far as possible.

Motors are to be connected at once as required, the balance wire being introduced only for motor work. The monocyclic system was selected chiefly on account of the facilities it offers for the economical operation of motors, and the fact that it allows of a practical solution of the day-load difficulty.

The Pittshurg Reduction Company has closed a coutract with the Niagara Falls Hydraulic Power Mauufacturing Company for 3000 horse power, delivered in the shaft of the turbines to be placed under the high hank hy the Hydraulic Power Company, this power to be furnished at a remarkahly low figure. The Reduction Company will install upon these turbiues direct current geuerators, the current from which will he used for the manufacture of aluminum.

There has been devised an efficient electric bicycle lamp, which is composed of a dry battery one-half inch in diameter and four inches long. A continuous light is supplied for 150 hours without recharging. The advantages of the lamp are that there is no smoke, and the vibration of the whcel does not affect the light, which is far hrighter than the oil lamp. An inexpert person cau remove an old battery and replace it with a uew one.

Electrical engineers question the ecouomy and feasibility of using for long distances the form of trolley employed on the Baltimore tunuel switching engines, aud also doubt whether motors of such great weight (ninety-six tons) are required for light, fast trains. Those two machines have, however, proved successful in the work for which they were built—transferring heavy through expresses and freights across the city.

A story which must he taken with reserve comes from Birmingham, England. It is said that a new primary battery has heen inveuted which uses a substitute for zinc costing one-

twentieth as much as that metal, and greatly cheapening the cost of producing electricity. A system of circulating the fluids has also been devised to prevent "polarization" (a paralyzing deposit of material on the plates), so that the battery will run steadily for ten hours and recuperate in ten minutes.

Practical Information.

Advantages of Heating Feed Water.

The percentage of saving of fuel resulting from heating feed water by exhaust steam or waste gases is expressed by a foreign writer by this formula:

$$\frac{100(T-t)}{H-t} = \text{percentage of saving.}$$

Where H = the total heat in the steam at boiler pressure; T = temperature of feed water after heating; and t = temperature of feed water before heating. Thus, suppose a boiler working at a pressure of sixty pounds per square inch above the atmosphere, fed at a temperature of 60° F., and driving a non-condensing engine, the exhaust steam from which is allowed to escape into the atmosphere. By utilizing this exhaust steam in a properly designed feed water heater to raise the temperature of the water to, say, 212° F., the percentage of saving of fuel would be:

$$\frac{100(212-60)}{1207.2-60} = 13.24 \text{ per cent saving}$$

effected. Where H = 1207.2 (the total units of heat in steam at sixty pounds pressure above the atmosphere); T = 212° (the temperature of feed water after heating): t = 60° (the temperature of feed water before heating).

If the feed water is drawn from the hot well of a condensing engine at, say, 100° F. temperature, the result of heating it to 275° F. in an economizer in the fuel would work out to:

$$\frac{100(275-100)}{1207\ 2-100} = 15.8 \text{ percentage of}$$

economy gained. With a coal consumption of only fifteen tons per week (the coal costing, say, 8s. per ton), the saving in the cost of coal alone, taking the lower figure of 13.24 per cent, would amount to $200 in a year, which would more than cover the outlay of installing a suitable heater, the subsequent economy being so much clear profit. The relative saving would, of course, be greater with coal costing more, or by raising the temperature of the feed water higher.

In addition to the actual saving of fuel resulting from the heating of feed water, there are incidental advantages accruing, which, although not so strikingly apparent as a reduction in the coal bill, are none the less real, among which may be mentioned the obviating of expensive repairs and renewals due to wear and tear caused by unequal contraction when the hot places are cooled by currents much below the normal temperature of the great bulk of the water in the boiler. More power can be obtained from boilers fed with hot water, as the heat from the fuel performs its proper function of evaporating, instead of being partly dissipated in raising the temperature of the water to boiling point. Priming and smoke emission often result from having to force the fires to heat up large quantities of cold water in the boilers when this has not been previously heated.

With limy waters a considerable proportion of the lime salts is precipitated by heating the water to boiling point, and this is especially the case where suitable reagents are used, with the result that purer water is sent to the boilers, obviating to a great extent the evils of incrustation and internal corrosion.

A SATISFACTORY METHOD of removing sticky deposits of grease and dirt from parts of machinery by means of soda ash is reported, as follows: To 1000 parts by weight of water, about 10 or 15 parts caustic soda and 100 parts ordinary soda is the rule. This mixture is boiled, and the parts of the machine that are to be cleaned are placed in it, this treatment having the effect of quickly loosening all grease, oil and dirt, after which the metal is thoroughly washed and dried. The action of the lye is, of course, to form with the grease soaps soluble in water; and to prevent the lubricating oil, etc., hardening upon the parts of the machinery when in use, a third part of kerosene is added.

Artificial Marble.

"Nine tenths of the marble-topped tables and so on—what I might call furniture marble—seen in this country are made of artificial marble," says a man in the trade.

Thousands of tons of this mock marble are made annually, and even men in the trade can scarcely tell the difference between the real and the false article, for the markings or marblings go wholly through the block and are not merely superficial. The basis of the whole is a combination of limestone and chalk, which, chemically treated, can be made of any shade desired. The artificial marble in the rough is placed in a water bath, and upon this is sprinkled a sort of varnish, consisting of sequioxide of iron, gum and turpentine, and all manner of marbled designs are produced when the turpentine is broken up by the addition of water.

Any pattern of marbling can be produced to order. Once such pattern appears the air is expelled from the block and the colors are fixed by the immersion of the stone in sulphate and warm water baths, and then another bath of sulphate and zinc so closes up the pores and hardens the stone that it acquires the density of the natural article and can be cut and polished in the same manner.

The Earth's Unseen Moons.

Astronomers conceive it to be possible for the earth, under certain circumstances, to capture as satellites some of the roving meteoric bodies known to be numerous in space, instead of bringing them to the surface as aerolites. As these bodies are too small to be seen—a mass of 100 tons being invisible at 800 or 1000 miles when brightly lighted—the earth may be attended by hundreds of invisible moons. Sir J. Hirschel was even of the opinion that they may be large enough to be visible for brief intervals when beyond the earth's shadow; and Sir John Lubbock has supplied formulæ for calculating the distances from observations of this kind. M. Petit, director of the observatory at Toulouse, has been led by observation and calculation to conclude that the earth is attended by at least one meteoric stone of considerable size. It is about 26 times nearer than the moon, its orbit being 5000 miles from the earth's surface, or 9000 from the center, and the tiny moon revolves around the earth in three hours and twenty minutes.

PERMANGANATE OF LIME is advocated for the purification of water, as it is said to split up very readily in the presence of organic matter into oxygen, oxide of manganese, and lime, having great oxidizing power and capable of destroying micro-organisms. It has the advantage also of being neither poisonous nor caustic. M. Bordas is said to have concluded, from comparative experiments, that permanganate of potash has only a one-hundredth part of the sterilizing power of permanganate of lime.

IF the assertion of Friedr. Krupp, the gun manufacturer of Essen, Germany, be true that an addition of tungstate of soda to electric light carbons will increase their duration, it will lead to a great demand for this article. Krupp claims that he prolonged the life of the carbons by 17 per cent, and even by 28 per cent when the lower carbons were taken somewhat thicker.

PROSPECTING
Coal and Metal Mining, Steam Engineering (Stationary, Marine and Locomotive), Electricity, Architectural and Mechanical Drawing, Plumbing, Heating, English Branches, etc.,
TAUGHT BY MAIL.
To enroll only necessary to know how to read and write. Circular free. State subject you wish to study. The International Correspondence Schools, Scranton, Pa.

The Briggs
TWO-STAMP MILL,
850-lb. stamps; weight of mill, 6000 lbs.
The most substantial mill ever offered to miners; discharges both ends and front; will crush from 6 to 10 tons per day; any one can set it up. Complete as per cut, price $450.00. This mill is furnished with 9-inch cast steel shoes and dies and substantial indepen. dent iron guides.
Western Manufacturing Company,
114 and 116 Mission St., San Francisco,
Builders of all kinds of Saw Mill and Mining Machinery, Engines, Boilers and Special Machinery.

1000 FEET FOR $1000.
This can be done with the
CHAMPION DIAMOND CORE DRILL
That we own and desire to sell, having completed prospecting our mine. The plant is complete in every detail, including every tool and diamonds, and is practically new. The 1¼-inch core can be taken out 1000 feet in depth at any angle at the rate of 20 to 50 feet a day. Why sink shafts, drive drifts and fight water to know your mine?

F. A. HUNTINGTON'S NEW IMPROVED
Centrifugal Roller Quartz Mill.
This Improved Mill has the following advantages over my Geared Mills, viz:
1st.—I dispense with the wooden frame with posts and set the mill on heavy timbers or a concrete foundation, thereby securing a solidity that cannot be attained when set on posts.
2d.—I dispense with gearing and drive direct from the pulley.
3d.—There are five less places to oil.
4th.—The Mill is built much heavier and stronger than the former ones.
5th.—Being heavier and set on a solid foundation, it can be run much faster, thereby increasing its crushing capacity in the same proportion as centrifugal force is increased by increased velocity.

Manufactured by F. A. HUNTINGTON,
143 First Street, San Francisco, Cal.

GATES ROCK AND ORE BREAKER

OVER 3000 IN USE THROUGHOUT THE WORLD
PRODUCES A MORE PERFECT CUBIFORM MATERIAL AND A GREATER QUANTITY IN A GIVEN TIME PER HORSE POWER USED THAN ANY OTHER CRUSHER ON EARTH.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

SAVE MONEY

BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE

FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon=21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

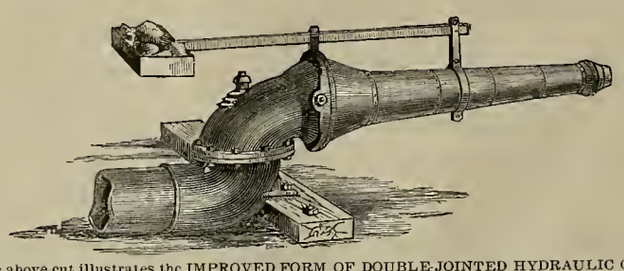
A REVOLUTION IN ORE PULVERIZING.

THE

Merralls Hydraulic Quartz Mill,

The Greatest Ore and Rock Pulverizer in the World, Either Wet or Dry.

THE ONLY MILL BUILT THAT RIVALS STAMPS. Our six-foot mill (No. 1) will reduce the ore or rock to pulp than a ten-stamp mill, with less than one-half the power and less than one-half the wear and tear, besides saving a much larger per cent of the gold in the ore.



This mill will reduce from 25 to 500 per cent more ore than any other rotary mill in use. Cheap, simple and economical. Four sizes built—from 15 to 250 tons capacity.

Send for Circular. Address

MERRALLS MILL COMPANY,

147 Fremont Street ..... San Francisco, Cal.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

Mining Share Market.

SAN FRANCISCO, October 17, 1895.

While a vast majority of persons dealing in mining shares have become more pronounced in their bearish proclivities, shrewd and successful operators who are not swayed by surface inclinations are becoming more pronounced in their hullish views. While the latter hold to the belief that the manipulation of the market may and probably will send prices slightly lower, yet there would be nothing in this to warrant the assertion that they will not recover and still better figures obtain before long. This view of the situation they form from past experience, for they say that mining share markets, like history, repeats itself. From the action of the market the manipulation has been changed, and in doing this regular traders for turns or otherwise are laboring at a disadvantage in trying to guess how things will go even from day to day. The taking up of one or two stocks in a group to make active at stronger prices leads to general selling when the leader begins to sag off. This affords unmistakable evidence that it is to create a selling pressure and not a buying desire from outside operators. Every conceivable kind of bear points are put out, and not one of a favorable character. This is done in the interest of those who see better things in the future, although, as stated above, slightly lower prices may rule first.

The feature of the market the past week was an advance in Confidence and Challenge on Friday and Saturday. The former, on regular call, sold up to $2.15 and the latter to 76 cents, although after call they sold slightly higher. The advance was chiefly on shorts. They then sold down a little more than 15 per cent, carrying the others in that group down also. On Saturday, under outside buying, Hale & Norcross sold up to $1.70 after call, due to a report about a court decision regarding the pending suit; but with better information regarding it, prices fell off, unfavorably affecting prices for shares in the middle group. No sooner did Hale & Norcross begin to sell down than Union and Sierra Nevada showed strength. The former sold on Tuesday up to 97 cents and the latter to 76 cents. Their advance did not strengthen the shares in that end; but when they sold lower, then the others followed down in sympathy. It is this kind of manipulation that is mystifying the "street," creating bears and bringing in sellers from the outside public, yet no one should run away with the idea that a big deal is near at hand even under better concentration, for this will not come until men with large capital combine and come into the market, and they will not do so until something is shown up which justifies them venturing in and backing the proposition with $20-pieces. The market this morning was active at lower prices, with the public selling.

From the Comstock mines our advices are essentially unchanged from that given last week. In Alta they cut into ore going above $30 a ton. In the Gold Hill group Belcher and Seg. Belcher's joint west drift is being pushed ahead. They expect to strike the west lode about 90 feet farther in. Crown Point continues to extract and mill some low grade gold ore, which merely pays for the extension work going on in the mine. The west drift is being run. From Yellow Jacket reliable information is hard to get, but it is reported that favorable advices ought to come to hand before long. In Confidence a north lateral drift is being run so as to crosscut the lode at different points. On the surface tunnel the west drift ought to be near the downward continuation of the ore found above. It is thought that when this is struck better prices will follow, but it may send them down first, for the share market goes by the rule of contraries. The west drift in Con. Imperial and that in Alpha are being run at the rate of about 2½ feet a day. This means that the ore will not be struck under from four to six weeks. In both Bullion and Gould & Curry slow work is being done in the long west owing to the distance in and the character of the ground. In Potosi, Chollar, Hale & Norcross and Savage the work is about of the same character heretofore given. It does not indicate anything calculated to excite the curiosity of dealers. In Con. Virginia, Ophir, Mexican, Union and Sierra Nevada there is more work being done than for many months, and this work is in ground which may give good results. Those who have information of the work being done are quite hopeful; still they say that considerable exploiting and developing will have to be done. This means time and money. From the Bodie district nothing new comes to hand. More exploiting work seems to be done in the mines. The Brunswick lode is spoken of very encouragingly by those who should be in position to know. The work now under way will soon be followed by more important, when good results are looked for with considerable confidence.

The lowest and highest prices paid on regular call from Oct. 10 to Oct. 16, inclusive, were as follows:

	Lowest.	*Highest.*

LONDON—Talk in New York about increasing confidence abroad in American securities may be true theoretically, but for all practical purposes not five per cent of investors or speculators here are thinking about American securities one way or the other. The attitude is one of the complete indifference. The large houses which have been identified with American stocks are still in that market. Raphael, Leon, Borthwick-Warck, Higgins & Clark, Satterthwaite and other large houses are still in Americans, but the rank and file which used to number four or five hundred men have gone into Kaffirs. I wrote you, the other day, that Kaffir market numbered hundreds of brokers. Since then, I have taken pains to approximate the attendance there and think it entirely safe to say that of the 3,000 members of the London Stock Exchange at least 2,000 are dealing in South African or Australian mining shares. Fully ninety per cent of the present volume of business in the London Exchange is in mining stocks.

In order to determine whether there was really any defined "sentiment" anywhere in regard to the securities, I talked with several houses here principally identified with American securities. Those who really knew something of our affairs insisted that our currency is unsound and redundant, and lay stress on the insufficiency of Treasury revenue, and the danger always present as a result of the greenhacks' existence. Those who knew comparatively little of our affairs talked about "dishonest management" of our railroads, and so on, but without very much discrimination or discretion. They seemed to think all American railroad men were highway robbers in a thin disguise. Of course they knew little or nothing of the real position of affairs. The disgust of the average American "jobber" or "dealer" at the course of the market is quite comical. His complaint is that just when everything looks promising for an advance, stock is heavily sold from New York, and the advance is squelched.

There are some really intelligent firms here, however, who appreciate the position of the United States quite as well as we do ourselves, and are extremely well informed as to many of our important systems. They fear the currency trouble, but not to such an extent as others and rather believe that the solution will come in time in the shape of the immense increase in gold production that is assured for the next ten years at all events. Just at present they are altogether indisposed to touch our securities other than gilt-edged gold bonds. In short, it does not seem that London will be a factor of importance in our market for some time to come. Probably not until it is made clear that our currency problem will be tackled in real earnest and solved in a sound and comprehensive manner, shall we have European investment in our securities on a large scale. When, however, it does begin it will be on a scale, unexampled, not merely in the last few years, but in the history of the country.—Cor. Dow, Jones & Co.

Coast Industrial Notes.

—California was second, with 713,480 bushels, on the list of States in the bean crop of '94.

—The Shasta Lumber Co. has an order from the Mountain Mining Co. for 38,000 railroad ties and 1,500,000 feet of lumber.

—The S. P. Co. water works recently put in two new patent automatic water columns at Gold Run, the first of the kind to be used on the coast.

—The Shipowners' Association of this city has started a movement to do away with the employment of pilots and the taxation of floating property.

—In the State there are 6459.739 miles of railroad, assessed for $43,018,640. The amount of State taxes is $294,677.64; county taxes, $490,708.58; total State and county taxes, $785,386.22.

—The Union Iron Works has the contract for two of the six composite gunboats for the U. S. navy, and will begin work on them by December 1st. They will cost $230,000 each, exclusive of armament.

—According to the Mexican *Herald* during the past three months drafts for over two and and a half million dollars in gold have passed through the Wells-Fargo Express Company with which to purchase Mexican dollars for the Japanese government.

—Secretary of the Navy Herbert has under consideration the report of the Board of Naval Bureau chiefs on proposals submitted for building six light-draft gunboats, which recommends the award of one of the single-screw boats to the Union Iron Works.

—The Consolidated Canal Company, near Messa, fifteen miles east of Phœnix, Arizona, is building a power house where a crosscut canal will deliver 10,000 inches of water to the Tempe canal. The intent is to develop 700 horse power by three turbines, for electric lighting of Mesa, Tempe and Phœnix.

—The Nevada Southern railroad was sold at sheriff's sale in San Bernardino last Wednesday for $153,966 to K. B. Anderson, who is believed to represent the recently organized California and Eastern Railroad Co., backed by Denver and Chicago men. By itself the line is valueless, and appears to be worth more to the A. & P. Co. than any other corporation.

—An effort is being made by business men of Spokane, as well as those of the Big Bend country, Washington, to have the bondholders of the Washington Central take charge of the road and run it as an independent line. The line was constructed as a feeder for the Northern Pacific, and when the main line went into the hands of a receiver the Washington Central followed suit.

—The Commercial Oil Company of Los Angeles have a process by which they say better lubricating oils can be made from the Los Angeles crude oil than from the Eastern crude oils. The process leaves the asphaltum uninjured by the heat, as good as the best imported and much cheaper. The company now furnishes distillate for gasoline engines and oil burners, and fuel oil for steam boilers and furnaces.

Commercial Paragraphs.

OWING to the increased demand for "P. & B." products abroad, it has become necessary for the Staudard Paint Company, No. 2 Liberty street, New York City, to establish headquarters of its own in England. For this purpose President Shainwald sailed on the St. Louis on Wednesday, September 25th. Mr. Shainwald contemplates spending two or three months abroad and expects to establish agencies for the sale of "P. & B." products in all the principal foreign cities.

THE E. P. Allis Co., of Milwaukee, have been awarded a contract by the Andrews Brothers Company, Haselton, O., for two heavy staudard type vertical blowing engines which will be capable of delivering the air at a pressure of twenty-five pounds per square inch, with the engine running at a speed of fifty revolutions per minute. They have also received a contract for two 16x36 inch Reynolds-Corliss 1890 type engines from the Bellaire (O.) Nail Works Company.

THE Niagara Falls Hydraulic Power and Manufacturing Company has just contracted with James Leffel & Co., of Springfield, Ohio, for four of their improved double discharge horizontal shaft turbine wheels, of 7500-horse power capacity, which is far the largest here under which turbines of large capacity have ever been applied in this country or elsewhere. These wheels will drive eight large electrical generators, one being placed on each side of each wheel, connecting directly to the horizontal shaft of the turbine, without gears or belting, the electrical current being used for power and lighting purposes. This is the second large order for turbines built by James Leffel & Co. for Niagara Falls, the two being already several of their wheels of 12,000 horse power each in the Cliff Paper Co.'s new mills, located at the foot of the cliffs near the tunnel. The said Leffel Company are building also four of their Cascade wheels for one company, to be operated under 730 feet head. The part of these wheels being connected directly also to generators, for power in mining operations, the Cascade wheel being essentially and entirely different from the turbine, operating upon an impulse and reaction principle. These Cascade wheels will have an aggregate capacity of 600-horse power.

THE mining department of the Edward Allis Co., of Milwaukee, Wis., is experiencing a reign of prosperity, having 1500 men on the payroll, busily preparing for shipment the

MINING SHAREHOLDERS' DIRECTORY.

lowing contracts: A steam hoist and concentrator for F. Lopez y Gutierrez, of San Luis, Mexico; a deep mine pump and concentrator for Maximiliano Damm, of Durango, Mexico; a 100-ton concentrator for the Byron N. White Co., Three Forks, B. C.; an air compressor and sinking pump for the Kootenay Mining Co., of Pilot Bay, B. C.; a 10-stamp gold mill for the Giles Gold M. & M. Co., of Boulder, Colo.; an air compressor for the Standard mine, of Wallace, Idaho; a copper smelter for the Copper Queen Cons. Mining Co., of Bisbee, Ariz.; a concentrator and copper smelter for the Detroit Copper Mining Co., of Morenci, Ariz; a 20-stamp gold mill for the Yellow Jacket Mining Co. in Idaho; a 5-stamp gold mill and power plant for the Crow Peak Mining Co., of Spear Fish, S. Dak.; a hydraulic hoist with Pelton wheel for the Bunker Hill and Sullivan mine, near Kellogg, Idaho; a roller process lead mill for Jno. F. Lewis Co., of Philadelphia, Pa.; an 18x36 Corliss steam plant for the Silverton (Colo.) Mining and Smelting Co.; and a roller process chlorination and steam plant for the Sunshine mine, of Salt Lake City, Utah.

Personal.

HENRY JANIN is visiting Trail Creek, B. C., mines.

MR. H. T. SCOTT has returned from a visit to the Atlantic slope.

GOV. BUSH has fled from the tules to the hills, and is at Alta this week.

J. J. HILL will resign the presidency of the Great Northern Railway Co., Jan. 1, '96.

F. S. MITCHELL, Butte, Montana, is now master mechanic for the Montana Ore Purchasing Co.

D. B. HANSON, representing the E. P. Allis Co., has returned from a business trip to Humboldt Co.

JAS. PROBARE is about to put up a steam hoist at the Vorlander mine, Amador Co., and actively develop the property.

HAMILTON SMITH, who has been looking at the Anaconda, Montana, copper properties, has returned to Cripple Creek, Colo.

MARK B. KERR is superintending the mining operations of the South Paloma G. M. Co. at Valley Springs, Calaveras Co., Cal.

THOMAS JENKINS, late superintendent for the Sierra Butte Co., Whitlocks, Mariposa Co., has resigned his position and goes to England.

C. P. HUNTINGTON scoffs at the Butte, California and Boise R'y., and says it will not be built: thinks there are too many railroads now for profit.

JESSE COULTER, recently superintendent of the Nelson Hydraulic Mining Company, Forty-mile creek, Nelson, B. C., has returned to Murray, Idaho.

W. M. JAMES now has charge of the Lancaster property, Witwatersrand district, South Africa, in what the South African *Mining Journal* calls "banket mining," going deeper in the "reef."

MATTHEW ARNOLD has been appointed superintendent of the foundry and machine shop of the California School of Mechanical Arts. For nearly twenty-five years he was connected with the Union Iron Works.

S. FUGIOKA, "a Japanese mining expert," is at Great Falls, Montana, looking at the smelters. He is making a tour of the United States, examining and studying the methods of treating all kinds of ores in this country.

CHARLES TAYLOR, who has been superintending a mine in the Cable district, Montana, for the past year, has been called to assume the management of a group of mines owned by an English company at Penang in the Malay islands.

W. H. RODDA, a delegate to the Miners' Convention, who was superintendent of the North Star mine here many years ago, and who has recently had charge of the Banner mine, near Oroville, has accepted an offer to go to South Africa.

GENERAL MANAGER KRETTSCHNITT of the S. P. Co. has designated J. A. Fillmore as Manager of the Pacific System of the Southern Pacific, which includes the roads between Ashlaud, Oregon, on the north, Ogden on the east and El Paso on the south. W. G. Curtis is appointed Engineer of Maintenance of Way of the Pacific System and the lines in Oregon.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL. M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

THE BLASDEL IMPROVED ORE CONCENTRATING BELT.

We are now having our belts made by the best rubber manufacturers in New York and Boston, under written guarantees both as to quality and mechanical construction.

We have been granted two United States patents for improved devices in concentrating belts, the first and most important of which is for a slight riffling of the surface at intervals and crosswise of the face of the belt.

While these riffles are only about one-thirty-second of an inch in depth, they are very effective in saving floured sulphurets and reclaiming quicksilver and amalgam that may escape from the plates, thus gaining a large percentage of values that would go off with the tailings from belts with entirely smooth surfaces.

Our second patent is for an improvement in the flanges which practical mill men will appreciate. They stand at an acute angle inwardly, therefore they thoroughly confine the pulp on the belt; and in passing over the end pulleys of the machine, lie partly down, consequently do not crack or break, as do the old-style flanges; thereby much vexation and loss is avoided. *We keep in San Francisco and New York belts of all lengths and widths suitable for all concentrators in general use.*

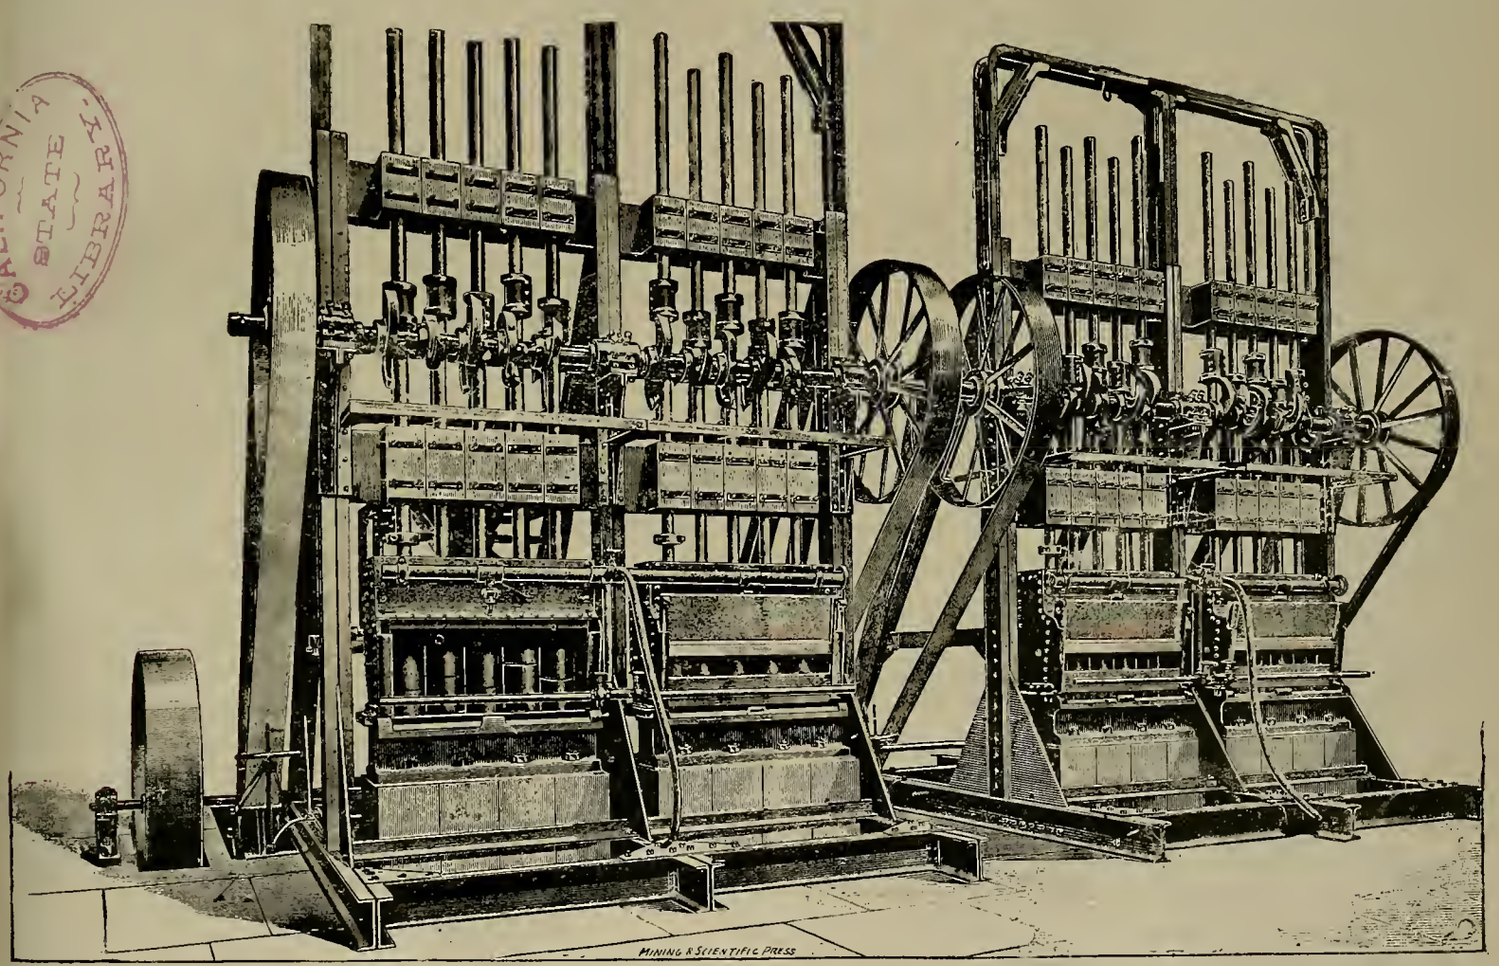
AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXXI. Number 17. SAN FRANCISCO, SATURDAY, OCTOBER 26, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Steel Frame Stamp Battery.

Among other requirements of South African mining machinery is the absence of wooden framings or fittings, by reason of the climate and the unceasing activity of insects. The teredo in our waters is not more destructive to piles than certain forms of insect life to wooden framings.

The accompanying illustration is of a 20-stamp battery, built in England for a South African mine. It is not wholly of iron, but nearly so.



The joints are planed and fitted, with the holes drilled in position. The battery was first erected complete at the works, and all the parts marked and photographed, making its re-erection at the mine an easy matter. It is made in sections of 250 pounds, where transportation is difficult and costly, or in sections of 30 cwt., as desired. The bolts are fitted with lock nuts, and rivets are supplied for riveting up at the main when required. The battery is arranged in sections of two of ten heads each, having five heads in one mortar box, each five heads being driven by an independent steel pulley, so that any section can be stopped without the others. It will be noted that the construction and operation is different in some respects from our California stamp mill.

The countershaft is of steel, fitted with bearings, with gun metal steps, lubricators, pulleys for driving the stamps, couplings, and loose collars fitted with steel set screws, and main driving pulley for receiving power from the engine or turbine, of steel, fitted with key and keyway. The cam shafts are of steel, each fitted with five steel cams, having lifts from six inches to twelve inches as required. The cam shaft bearings are fitted with oil catchers, gun metal steps and lubricators. The stems are of wrought iron, each tapered to enable them to be reversed. Each stem is fitted with a chrome steel tappet fitted with three keys. They are faced on the top and bottom sides, so as to be reversed when worn. The shoes are of chrome steel, with heads bored out so that either end will fit the stem and the shank of the shoe, suitable slot holes being provided so that the stamp and shoe can be removed; the whole design gives a falling weight of 850 pounds. Each head of stamps is fitted with fingers for propping up.

The motor boxes are made whole or in two parts, or in sections of 250 pounds as required. The boxes shown in the illustration are in two parts, the lower parts being of cast iron and the upper part of wrought steel, fitted together with planed joints, and through bolt holes and lock nuts. Each box is fitted with five steel dies, with hexagons on the lower edge to prevent turning in the box. If desired, the top part of the motor box can be made of steel plates, having an interual lining, and fitted complete with water-distributing pipes, and arranged to receive amalgamated copper plates when required. The grate frames are fitted with chock blocks and thick amalgamated copper plate, whereby the depth of discharge can be altered at will. Hose pipes and cocks are supplied for washing out and cleaning the launders. The launders are supplied complete with arrangements for altering the angle of the launders, and each set of five heads has an independent amalgamated copper plate surface of large area, and fitted with a frame for supporting the launders clear of the battery framing. Australian mercury wells are fitted at the end of each launder, and the outlets arranged to convey the tailings over blankets or settlers as may be required.

The automatic feeders can be constructed of wood or wrought iron framing. A runner and hook with framing are provided to lift the stamps, etc. The sizes of battery usually supplied are 650, 760, 850, 900 and 1000 pounds, having a maximum fall of twelve inches at ninety blows per minute.

A California stamp mill, built of steel and iron throughout, with not a particle of wood in its composition or framing, will form the subject of a subsequent illustration, the second being interesting by contrast and comparison.

STEEL FRAME STAMP BATTERY.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Steel Frame Stamp Battery, 265. Sawmill in the Pine Region of the Sierra Nevadas; Lumber Flume from the Mountains to Moore's Station, Butte County, 269. The Chavanne Regulator, 272.

EDITORIALS.—Steel Frame Stamp Battery, 265. List of Mines and Mine Owners in Great Britain; Production of the Broken Hill, Australia, Silver Mine; Sale of Anaconda Shares; Effect of Silver on Railways; An Important Suit; Pressing Work Before the Legislative Committee of the Miners' Association; Duty on Lead Contained in Sulphide of Silver; Assessment Work; Opposition of the Anti-Debris Association to the Plans of the U. S. Debris Commission; How Assessment Work Is Estimated, etc.; Denver Drilling Contest, 266.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 270-71.

SCIENTIFIC PROGRESS.—Testing Pacific Coast Timber; Different Forms of Commercial "Gas," 272.

MECHANICAL PROGRESS.—The Chavanne Regulator; New Use for Steel Wire; Horseless Vehicles, 272.

ELECTRICAL PROGRESS.—Electricity for Logging; Very Probable; A Great Locomotive; Lighting Railway Trains By Means of Storage Batteries, 273.

PRACTICAL INFORMATION.—Active Aleutian Volcanoes; Annual Requirement of Steel Rails Per Mile of Road; A Fluid to Write on Glass; Manganese; Metric System of Weights and Measures, 273.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 278.

MISCELLANEOUS.—Concentrates, 267. The Sampling and Measurement of Ore Bodies in Mine Examinations; Reasonable Geology, 268. Lumbering Scenes; The Ruins of Mashonaland, South Africa; Sale of Portion of Mining Claim; Uses of Sawdust, 269. Coast Industrial Notes; Personal; Commercial Paragraphs; Notices of Recent Patents, 271.

THE British Department of Mines and Mineral Statistics has issued a hulky volume containing a list of the mines and mine owners of Great Britain. Fame awaits the man or official department that issues a similar list for this country—or even State.

SINCE '85 the Broken Hill, Australia, silver mine has yielded 71,616,192 ounces fine silver, an important factor in the world's silver output. The rich carbonate ores are reported to be almost exhausted; great quantities of sulphides remain, with lessening possibilities of profit.

THE reported sale of 300,000 shares of the Anaconda, Montana, mine is confirmed by the California owners of that property. The transaction was completed last Tuesday. The amount paid is $7,500,000. The control of the mine remains in the hands of the American owners.

THE price of silver is of as much importance to the stockholders of the several railroads of the country as to the producers of the white metal. It makes all the difference between dividends and depreciation. Every railroad traversing the silver mining districts has gone into the hands of a receiver. With silver at anything like its old-time figures those railroads would be dividend-paying. And the railroads form but one branch of the business of the country similarly crippled by the present silver status.

AN important suit—important to publishers—is now on trial in New York. The Ingraham Interlining Co. sues *Vogue* for $10,000 damages for declining to publish that company's advertisement. Advertising experts say the company has a good case. This paper thinks the company has no case at all. It is hardly possible that any judge or jury would seriously entertain the issue. It is of some local importance. The MINING AND SCIENTIFIC PRESS weekly declines proffered business from parties whose patronage is not deemed desirable, and is interested in knowing if similar action in New York is legally obnoxious.

THE most pressing present work before the California State Miners' Association is that in hand by the Legislative Committee. Its report, which was unanimously endorsed by the convention last week, was an important one, outlining the purposes and policy of the association in regard to hydraulic mining and showing what had been done. The two bills already drafted for congressional action are worthy of the indorsement they have received and will need careful attention. A third bill to be introduced in Congress is now in process of preparation, applies to the segregation of mineral lands, being the framework of a California classification similar in outline to the Montana bill passed in the 53rd Congress. That act was shorn of some of its value by failure to provide that the commissioners appointed under its provisions shall be residents of the State—a mistake that will not be repeated in the bill for a similar commission for California to be introduced next December in the National Legislature.

WHETHER in ignorance or defiance of the fact, it is a fact that the Anti-Debris Association and a few subservient valley newspapers are hurting their region and doing the entire State an injury by opposing the plans of the U. S. Debris Commission to reclaim the Yuba and Feather river channels. That the railroad corporations oppose it is to be expected; revenge for the attitude of the California Miners' Association on the mineral land question is second only to the impulse that seeks to check any probable means of transportation competition. That is open and understood, and the opposition of the Sacramento newspapers is explainable. Less easily understood is the action of some of the valley press and the executive committee of the Anti-Debris Association now doing its best or worst to hinder the only measure affording promise of protection or prosperity. In one column they bewail the blight that has fallen on the local market and in the next one attack the men who can alone remove it and decry the industry that has always furnished the valley producers their best cash customers. Apart from any broad feeling of justice, equity or State pride, the present attitude of those referred to is opposite to the plainest dictates of business interests.

THE Collector of Customs at the port of New York has recently addressed an inquiry to the Secretary of the Treasury in which he stated that large quantities of sulphide of silver have been received at that warehouse during the month of July last and subsequent months and asks whether or not duty should be charged in the lead contained in such sulphide of silver, and, if so, upon what basis it should be assessed, or what percentage of allowance should be made. With the inquiry were submitted four average samples of twelve entries, with the percentage marked thereon, as returned by the United States Assay Office, and a statement was made to the effect that the lead contained in this sulphide of silver is lost in the slag and goes off in the fumes and is therefore not extracted or recoverable. The percentage of lead in the samples submitted varied from .68 to .63 of one per cent, and the solicitor of the Treasury, to whom the question was submitted, has advised the Department to the effect that the small quantity of lead found in these samples is not subject to a separate duty under the provisions of paragraph 165 of the Tariff Act of August 28, 1894, which reads as follows: "Lead ore and lead dross, three-fourths of one cent per pound, provided that silver ore and all other ores containing lead shall pay a duty of three-fourths of one cent per pound on the lead contained therein, according to sample and assay at the port of entry, the method of sampling and assaying to be that usually adopted for commercial purposes by public sampling works in the United States." The Collectors of the ports will govern themselves accordingly.

MENTION was made in last week's issue of the necessary procedure where assessment work is done on one of a group of claims for joint benefit. Report of a case in point comes from Helena, Montana, where an application had been made for patent to five claims. The deputy mineral surveyor made report, showing that more than $15,000 worth of work had been done on one, but that the improvements upon the other four did not aggregate $500 on each lode. The Department returned the application for further proof, accompanied with the following communication from the Commissioner of the General Land Office: "On file with the case is the affidavit of claimant to the effect that the improvements upon the Easton lode tend to develop all the locations embraced in the entry. The evidence that the improvements upon one claim tend to develop other locations must be in the form of a certificate from the United States Surveyor-General to that effect, and claimant will, therefore, be required to furnish a certificate from the United States Surveyor-General of Montana, showing how the improvements on the Easton lode tend to develop the other claims embraced in this entry. The evidence of the use of occupancy of the Apex and Bonauza millsites consists of affidavits to the effect that they are used in connection with the Apex and Bonanza lode claims and that the improvements thereon consist of a house upon each millsite. Claimaut will be required to furnish additional evidence of the nature and extent of such use or occupancy. Notify claimant hereof, and that he will be allowed 60 days from notice within which to furnish said evidence, in default of which, or of appeal, the entry will be cancelled to the extent of the Apex, American, Bonanza, Easy Street and Easton Fraction lodes and the Apex and Bonanza millsites without further notice from this office."

INQUIRY is made regarding the manner in which the required amount of annual assessment work on unpatented mining claims is estimated, whether by the day's work or foot in shaft or tunnel; if by the day's work at what price, or if by the foot what price; and if work on necessary roads or trails can be counted as assessment work; also if allowance can be made for time traveling to and from the claims. The inquiries come from three different sections of the State—Shasta, Mariposa and Los Angeles. The work is estimated by the day's work at the ruling local rate. While the department rulings are uniformly favorable, showing a desire to interpret the statute according to its spirit, so far as is known by this paper no decision permits trail or road work to apply on the required amount of annual work or improvement. Work must be on the claim itself, or, if on other ground, with direct relation to it. No allowance is made for time or expense going to or returning from the claim. In this matter of assessment work, the attention of holders of unpatented mining claims in this State is directed to an act passed by the California Legislature March 31, '91, which prescribes that when the required amount of annual labor or improvements is put on an unpatented mining claim the owuer shall within thirty days file with the county recorder an affidavit describing the labor performed, the improvement made, and its value. The act provides that failure so to do renders the mine open to relocation.

IF the telegraphed figures of the Denver drilling contest last Saturday are correct, the Colorado miners beat the record. At the '93 contest D. L. Jones won the single-hand record, sinking a hole eighteen and eleven-thirty-sixths inches deep in fifteen minutes; Page and Reagan of Butte City, Montana, held the double-team record, drilling twenty-nine and fifteen-sixteenths inches in that time. Those records were broken at the first rock-drilling contest on this coast, held at the Midwinter Fair grounds on "Miners Day," May 21st, 1894, when E. F. Durham of Grass Valley took first prize and the world's championship, drilling a hole nineteen and thirty-one-thirty-seconds inches through the hardest Rocklin granite in fifteen minutes. T. J. Ahearn of Grass Valley also broke the record and took second money, drilling nineteen and nine-sixteenths inches. On the same day, in the double-team drilling, John Kitto and Sam Harvey beat the record and took first prize, putting in a hole thirty and twenty-one-thirty-seconds inches in fifteen minutes. In last Saturday's drilling contest at Denver these figures were beaten by three double teams from Leadville, drilling through Gunnison granite, the scores being thirty-five and five-sixteenths inches for Sullivan and O'Neil, thirty-four and thirteen-sixteenths inches for Stewart and Lingenbohm and thirty-four and eight-sixteenths inches for Regan and Dwyer. In the single-handed test five beat the record of nineteen and thirty-one-thirty-seconds inches made by E. F. Durham of Grass Valley, the scores being twenty-two and thirteen-sixteenths inches for Jones, twenty-one and eleven-sixteenths inches for McCutcheon, twenty and twelve-sixteenths inches for Bowen, twenty and seven-sixteenths inches for Sapp and twenty and one-sixteenth inches for Taylor.

Concentrates.

THE Northwest Mining Association now has a membership of nearly 500.

THE mill at the South Eureka, Sutter district, Amador Co., has resumed operations.

THE Crown Point Mining Co., capital stock $1,000,000, has incorporated at Park City, Utah.

THE *Argus* reports gravel that goes $100 to the car struck in the Gray Eagle tunnel, Placer Co.

THE Kamloops Mining and Development Company have transferred their plunt to Rossland, B. C.

BAILEY, PORTER AND THOMAS have bought the Briggs gold property near Riverside, Cal., and will develop it.

THE Alaska-Mexican Mining Company has declared a dividend of 15c per share, $30,000 payable next Monday.

NEARLY 1000 men are now working on smelter, road and mine for the Iron Mountain Mining Co. near Redding.

THE Tacoma Smelting and Refining Co. reports having shipped during September 287,237 pounds of bullion, valued at $48,412.27.

THE Alaska-Treadwell Mining Company will pay its regular quarterly dividend of 37½c per share, amounting to $75,000, next Monday.

IN '94 Butte, Mont., produced 51.6 per cent of the total copper product of the United States, and 26 per cent of the world's total output.

THE *Arizona Miner* says the extent of work done on the Congress mine amounts to about twenty-six miles of openings—shafts, drifts and tunnels.

FROM the Bonanza mine, near Baker City, Or., the superintendent brought to Baker City last week $4500 in gold bullion, the result of twenty days' run.

IN Sutter district, Amador Co., the Mahoney and Wildman mines have been connected by a tunnel. Twenty stamps are to be added to the Mahoney mill.

THE Champion mine in Nevada Co. is reported bonded to a French Company, for $1,250,000, $5,000 per month to be paid till Feb. 1st '96, when the option expires.

EVERY vessel heading for South Africa now has on board a California miner going under contract to take charge of some gold property at a handsome annual salary.

THE Shasta *Democrat* says there is strong probability of a deal being made by which the Bloss & McCleary gravel mine, near Trinity Center, will be sold to St. Louis capitalists.

OREGON expects to make a good gold showing in '95. For the calendar year 1893 the gold product of Oregon, as estimated by the director of the mint, was 79,592 fine ounces.

THE output of the Witwatersrand, South Africa, district for the month of August has been declared by the Chamber of Mines at 293,573 ounces, the highest monthly total yet reached.

THE Nevada Co. mining suit of Walrath vs. the Champion Mining Co., previously reported in full in these columns, is now being argued in the U. S. Circuit Court of Appeals in this city.

THE Mineral King, a silver mine twelve miles from West Point, Calaveras Co., has been placed on the London market; negotiations for a sale are pending. The price asked is $100,000.

THE Baker City, Or., *Democrat* says the Columbian mine in the Virtue district is being put in shape for a stamp mill to be put on the property in the near future. W. O. Reynolds has been engaged as foreman.

A CLEVELAND, O., COMPANY is putting up a 10-stamp mill to work a gold property situated on the west side of Smoky valley, forty-eight miles south of Austin, Nevada. The mill is to start up by January 1st, '96.

CHIEF-JUSTICE FULLER of the U. S. Supreme Court announces that the cases involving the Wright irrigation law of this State, affecting the validity of $20,000,000 of bonds, are set for the first Monday in January, '96.

DURING September the Alaska-Treadwell shipped bullion to the amount of $80,250; ore milled, 22,849 tons; sulphurets treated, 403 tons; bullion which came from sulphurets, $24,255; gross expenses for month, $22,583.

A VANCOUVER, B. C., correspondent reports the results of a clean-up at the Cariboo hydraulic mine to be $41,857 gold for twenty-nine and one-half days' work, and $26,125 for the clean-up at the Horsefly hydraulic mine.

THE Mineral act of British Columbia has been amended so as to give the owner of a mineral claim title to all minerals within the boundary lines of his claim continued vertically downward, thus stopping a fruitful source of litigation.

THE Laramie *Boomerang* says George Kipp and associates, the new owners of the Holy Terror mine, were recently offered $300,000 for the property by New York parties, who wanted an option for thirty days. The proposition was declined.

THE Troy Mining, Power and Improvement Company has incorporated at Spokane, Wash.; capital stock, $100,000; incorporators, R. Russell, F. K. McBroom and W. J. C. Wakefield of Spokane, E. L. Preston of Troy and C. D. Potter of Wallace, Idaho.

SUPERINTENDENT DUFFIELD of the Coast and Geodetic Survey says there is no longer any doubt that all of the Yukon river basin below the mouth of Forty-Mile creek is American territory, which includes the gold fields of that stream as far as opened.

P. WYBERG is one Yukon, Alaska miner who feels that his efforts have not been wholly in vain. He returned this week with nearly $45,000, the result of two years work on Forty-mile Creek. Those there now will freeze up with the country till next spring.

THE United States Court of Appeals at St. Louis has affirmed the decision of the United States Circuit Court in the case of Fullerton vs. The Homestake Mining Company. Fullerton got judgment for $23,000 and the case was appealed by the defendant.

THE Clara Gold Mining Company has incorporated here; capital stock $500,000. The following amounts are subscribed: F. H. Coy, H. Harris, Grizzly Flat, El Dorado county, $150,000 each; E. E. Simpson, San Jose, $1000; C. M. Cross, W. M. Abbott of this city, $500 each.

THE Alaska *News* says the recent discoveries on Douglas island will stimulate prospecting in that neighborhood to an even greater extent than ever before. With the addition to the Mexican plant and other mills to be built, 500 stamps will be in operation in a year.

THE Orinoco Company, the syndicate of United States capitalists which has secured concessions on the Venezuelan gold lands claimed by Great Britain, is preparing to send a large force of prospectors, miners and workmen into the field. W. N. Safford represents the company in New York.

J. P. CLARK AND F. J. COOK have sold the Oro Fino mine at Meadow Lake to Chicago and Colorado men for $20,000. The purchasers propose putting up a sawmill to get out lumber enough for a mill, hoisting works and other buildings before the heavy snows set in, and next spring buy a complete plant.

THE *Union* says Robert McMurray, who purchased the Tip Top and West Harmony mines, has changed the name to Delawnre, and both mines will go by the one name. Superintendent Gassuway is making good headway with the incline, being down about 75 feet of the 118 feet that he expects to sink.

THE Supreme Court of Utah holds that a locator of a quartz claim, who has allowed his location to lapse and become subject to relocation, under the statutes providing for the relocation of claims on which the required annual work has not been done has the right to make a new location, covering the same ground.

FANCY PRICES for prospect holes or mines with shafts from 10 to 50 feet deep is responsible for the limited amount of working mines, says the Butte *Inter-Mountain*. An undeveloped mining claim is like an undeveloped farm, and much money has to be expended before it becomes productive. Extravagant prices scare out capital.

LAST week's incorporations at Cripple Creek, Colo., were: The Manhattan Consolidated G. M. Co., capital stock $1,250,000; the Mountain Beauty G. M. Co., capital stock $2,000,000; the Saddle Mountain G. M. Co., capital stock $1,250,000; Atlantic & Pacific Mining and Milling Co., capital stock, $1,000,000; Tenderfoot Leasing and Mining Co., capital stock $1,000,000.

THE Homestake, B. C., mine has not been sold. The English syndicate offered a cash payment of $1800 to reimburse for wages paid; to assume the bond; pay an advance of $5000 on the property and develop the property on condition of the delivery of 51 per cent of the stock of the company. This offer the owners refused to entertain, but have submitted their ultimatum to F. Bernard, of Victoria.

THE Diamond-R Mining Company, of Great Falls, Montana, has sold its stock of silver, amounting to 170,000 ounces. It has been holding the silver in New York for a year and a half past, waiting for better prices than have recently been quoted. The price which was finally obtained is said to be 66.95 cents. The company figures that it made a little more than interest on its money by holding the silver till this time.

THE Independence mine, at Cripple Creek, Colorado, is owned by W. S. Stratton. During the first four months of this year it is stated the mine produced more than $650,000, and prior to January 1, 1895, the output, while the mine was being opened up, exceeded $1,500,000. A Colorado authority estimates that there are gold reserves blocked out of $2,500,000 and development in different directions is adding daily to this total.

GEORGE CHRIST of Nogales, Arizona, gives a copper item that goes to show how the money kings of the East are interested. He states that J. D. Rockefeller, the Standard oil magnate, has an agent out looking for copper property. The man went to Sonora. While in the latter State he bargained for a piece of property and telegraphed for the money. In less than twenty-four hours the money had been paid and the business done.

THE following is from the New York *Financial News*, where it is gravely given place in its mining column: "An old California miner found himself broke in the city of New York. Hearing of the Kaffir craze he made his way to London, organized a syndicate of forty old Californians, went to the South African gold fields and commenced—not mining, but promoting, and is now worth £1,000,000, spending about one-half his time in London placing his stock, the rest of the year in Africa working up prospects."

IN the past year mining activity has increased in Mexico. It is all silver mining except on the Pacific side of the country. The greatest activity has been in the State of Zacatecas, which, being on the main line of the Mexican Central road, gives that section greater facilities for marketing its ores than any other section possesses. The most money has been made in mining in that State and the State of Hidalgo. It is very different there from what it is with the people of gold countries. The silver is just as valuable to Mexicans or others, so long as they remain in Mexico, as gold relatively is to residents of the United States. They can buy just as much with it as they ever could, and such things as are imported from gold countries are sold cheaper because of competition.

THE South African Mining Department summarizes as follows operations in the Witwatersrand district for the three months ending June 30, '95: Metres driven, 25,031; metres sunk, 10,399; tons extracted, 963,747; tons milled, 859,371; tons per stamp per day, 4.033; concentrates produced, tons, 9372; concentrates treated, tons, 8818; assay value, ounces, 2.779; tailings treated, tons, 712,057; assay value, ounces, 0.241; whites employed, 6231; colored employed, 45,782; mill yield, ounces, 375,087; mill yield per ton, ounces, 0.436: value, £1,351,971; value per ton, 31s 6d; concentrates yield, ounces, 27,159; concentrates assay, per ton, 3.080; concentrates value, per ton, 224s 8d; tailings, ounces, 158,587; tailings per ton, ounces, 0.223; tailings, value, £486,214; tailings, value per ton, 13s 8c; total production of the Witwatersraud, ounces, 560,833; value, £1,937,255.

F. M. DICKENSON, secretary of the Broken Hill Proprietary Co., Port Pirie, Australia, writes from Melbourne to the *West Coast Lumberman* that the annual consumption of lumber in the mines of that company is 15,000,000 feet. The first fir lumber sent from this coast was in 1889. Mr. Dickenson says that it has not been in use long enough to enable an opinion to be formed on its durability; it therefore shows no age defects in the six years' test it has been put to. As fast as the timber becomes unnecessary in a mine it is removed and used elsewhere. The largest single order ever placed for fir was for 10,000,000 feet. The Australian mines take a wide range in timbers, running up to sticks so large that they could only be cut on the Pacific coast. The St. Paul & Tacoma Lumber Company of Tacoma, Wash., is now loading some 18x18 and 20x20—80 feet for Port Pirie.

AFTER all the rumors and denials, it is finally announced that a deal for 300,000 shares of the Anaconda copper mine has been definitely concluded. The new European buyers will have two directors in the board. The purchase is made by Kuhn, Loeb & Co., representing a syndicate consisting of themselves, the Rothschilds, Messrs. Cassel, Wernher, Bell & Co., and the Exploration Company of London, who have placed the stock in London at $30 a share. The par value of the stock is $25 a share. The mine has been owned by the estate of its discoverer, the late Senator Hearst of this State, J. B. Haggin and his partner, Mr. Tevis, and Marcus Daly, who is in charge of the operation of the mine. Michael A. Hickey, who discovered the copper mine in 1866, thought so little of his discovery that he failed to locate it until 1876. He subsequently sold it for $40,000.

A SUIT just brought in the Circuit Court of the United States for the Colorado district is a matter of great importance to mining men and ore handlers in general. It is entitled Guillermo H. Clark and Frank N. Clark against the Omaha & Grant Smelting Co., and involves not only the question of smelter charges and tolls, but the basis of their computation. Guillermo H. Clark of Culiacan, Sinaloa, Mexico, and Frank N. Clark of Omaha are associated in the business of buying ore under the name of G. H. Clark. In this line several shipments of ore were made to Omaha during 1894 and 1895 for treatment at the Omaha smelter. This ore was subject to the fluctuations of the silver market and on the assay value of the ore. In the pleadings in the case the plaintiffs aver for one cause of action that a certain shipment of ore in January, 1894, was handled by the Omaha smelter and returns were made for 11,259.66 ounces of silver, resulting from reduction, at the rate of 59.5 cents per ounce; whereas, on the day the silver was bought the actual value of the silver was 63.43 cents per ounce, a difference of 3.93 cents, which, the plaintiffs aver, the defendant company appropriated to its own use. In addition to importance to miners this case is one of much moment. It is the first of the kind ever presented to court, and its results will determine a precedent. Custom smelting is still carried on much as grist milling was in days gone by, and the irrepressible conflict as to tolls is as fierce as ever.

AT the annual meeting last Monday of the Con. Cal. & Va. M. Co. Messrs. Fox and Sieberst, each owners of one share of the company's stock, made technical objection to the election of a board of directors, on the ground that the shares represented did not appear on the company's books in the names of of the real owners. The old board was re-elected, with the exception of J. W. Twiggs in place of Con. O'Connor and T. H. Fish in place of G. R. Wells. The law upon which the dissenters base their claim is "an act for the further protection of stockholders in mining companies," approved April 23, 1880, as applies to the books of mining companies and elections held thereunder: Sec. 2. All stock in each and every mining corporation in this State shall stand in the books of said company in all cases in the names of the real owners of such stock or in the name of the trustees of such real owners; but in every case where such stock shall stand in the name of a trustee the party for whom he holds such stock in trust shall be designated upon such books and also in the body of the certificate of such stock. Sec. 3. It shall not be lawful for any such corporation, or the secretary thereof, to close the books of said corporation more than two days prior to the day of any election. At such election the stock of said corporation shall be voted by the bona fide owners thereof, as shown by the books of said corporation, unless the certificate of stock, duly indorsed, be produced at such election, in which case said certificates shall be deemed the highest evidence of ownership, and the holder thereof shall be entitled to vote the same.

OF the present London, Paris and German speculation in South African mining shares, Chauncey Depew, back from England, says: "There is one odd thing in connection with it, and that is the fact that no American money is going into this mad stock speculation. While I was abroad I had pointed out to me several men who had made at least ten millions of dollars apiece by this form of speculation in South African mines. The speculation there is much the same that it was in this country when the Leadville mines were being opened up. Why, men told me there that they feared to issue another dividend lest the stock should go up higher, and they would have so much money in their vaults that they would hardly know what to do. The matter is explained from the fact that there is a plethora of money in Europe just now, owing to hoarding and calling in on account of hard times. This money must have an outlet somewhere. The South African gold mines have proved to be rich beyond the ordinary, and they have been seized upon as the best known means of speculation. Every one trying to get in has sent the stocks kiting, and they are bound to come down like the proverbial sticks, leaving in the wake a lot of wrecks. The methods being followed abroad are exactly like those common during our own excitement. During the height of the Leadville craze a new mine was put on the market every day or so. The stock was watered and the money poured in. When the bubble burst, thousands were bankrupt. That is the way that it will be in England. I know of a case in this country which took place during the Leadville excitement. A man had a mine and he thought it was worthy of development. He came to New York and formed a stock company which was capitalized at $1,000,000. He sold his shares at $10 apiece. He disposed of all his stock, and was $1,000,000 ahead. His stock kept creeping up above par. It got to $15 and then to $20. The mine was richer than he thought. He watched it climb, and then came to the conclusion that it was worth more than he had given it credit for. He decided to get it back, and so he began to rebuy. He expended his entire million and another $500,000 that he had. He finally got the mine back; and just as he did, the bubble burst, and the shares went tottering. After the debris was cleared away, he found that it had cost him just $500,000 to put his mine on the market. That is the way that it is abroad. The craze is on, but it will all tumble, and Europe will stagger under the shock. It is a tribute to American acumen that we are not investing a dollar in the mad rush."

The Sampling and Measurement of Ore Bodies in Mine Examinations.

NUMBER I.

By EDMUND B. KIRBY.

Investors who contemplate the purchase of mining property, or who have to decide some question of business policy concerning property they already own, are frequently unable to judge of such enterprises or lack the time to investigate for themselves. It is then customary to call in the aid of some experienced mining engineer, in whose judgment and integrity absolute reliance is placed. Such men, who make a specialty of mine examinations, now constitute a large class of the engineering profession, and are commonly known as "mining experts."

The work is peculiar in that the engineer is generally called upon, not merely for his opinion on technical points, but as the judge of the investment. This makes the responsibility unusually heavy, since his decision is generally accepted as final, and the amounts involved are large.

The examination of a mining property necessitates an inquiry into everything that bears upon its value as an investment. Among the principal facts to be determined are the net value of ore already discovered, the chances indicated for further discoveries, the best metallurgical treatment and the past record of the property. Estimates are required of operating expenses, costs of development, equipment, etc., together with the profit to be expected. The price and terms of payment, the working capital needed, and the time required for its recovery, the question of title, the risks from litigation, flooding and other accidents, also enter the problem.

After these and all other pertinent facts have been carefully determined and arranged clearly before the mind, the main question at issue, of investment or policy, is decided by that business judgment which comes only from experience and knows no set rules or formulæ.

It is the object of this paper to discuss only one part of the work thus outlined—the valuation of discovered ore by sampling and measurement. This has little or no importance in some cases, either because no ore has yet been found, or its quantity is small, or other matters are sufficient to decide the question of investment. In other mines the amount of discovered ore is one of the chief considerations, and requires an accurate estimate. This is a difficult and laborious undertaking, often calling for every resource of technical skill. But little has been published upon the subject in professional literature, and every engineer has selected or evolved his own methods, generally with little knowledge of or reference to those of others. It is therefore intended to describe the methods which the writer has found most effective, in the hope that others engaged in the same field may also contribute to this important subject.

It is desirable to first define the exact sense in which the following terms will be used in this article:

Ore shoots are those portions of an ore deposit where the ore bodies are so frequent, or so grouped, that partial boundaries of some definite shape and direction may be drawn around them, and such specially productive portions thus distinguished from the rest. The term is also applied to a single ore body which has considerable extension in one direction.

An *ore body* is, in general, a solid and fairly continuous mass of ore, which may include low-grade and waste as well as pay ore, but is individualized by form or character from adjoining parts of the deposit.

Pay ore includes those parts of the ore body which are both rich enough and large enough to stope with profit.

In order that the facts may be clearly presented to the mind, the discovered ore is separated into two classes—*ore in sight* and *probable ore*.

"*Ore in sight*" is that contained in blocked portions of the deposit, each of which is so clearly exposed (by sections on several sides) that the limits, continuity and value of its contents may be determined, and relied upon with reasonable certainty. Such ore is thus a proven resource, ready for extraction, and is expressed in terms of net profit.

"*Probable ore*" is a more elastic term, and includes any blocked ore not certain enough to be "in sight," and all ore which is exposed for sampling, but whose limits and continuity have not been proved by blocking. It may also include any undiscovered ore which, from the evidence, is too strongly probable to be classed under the heading "chances indicated." Probable ore may be estimated in several distinct divisions, and the relative degree of probability assigned to each.

In practice the ore shoots and bodies of a deposit, themselves irregular in form, are found penetrated by every conceivable arrangement of mine workings, from orderly shafts and levels to the "corkscrew rat-holes" of the prospector or lessee. Thus every mine presents its own special problems.

The work of sampling and measuring both classes of ore is carried on at the same time and by the same methods. It is intended to estimate only the pay ore; and since its practical limits are those which will afterwards be defined by the actual stopes, it becomes necessary to ascertain what the shape and extent of these excavations will be, and measure only the ore within their limits.

In order to secure working room, the dimensions of the stopes will often be greater than those of the pay ore, and will thus also include barren rock and non-profitable ore. No attention is paid to these worthless portions if they can be kept separate in breaking. If, however, ore streaks and waste are so intermingled that it will be necessary to break them down together and sort out the richer portions afterwards, the measurements and samples are then made on the entire average mass as it stands.

Reasonable Geology.

NUMBER II.

By FREDERICK DANVERS POWER, F. G. S.

There are many other instances that might be mentioned—for example, "mundic" may be either iron pyrites or mispickel. Topaz may mean a mineral that rightly owns the name—a yellow crystalline variety of corundum known as Oriental topaz, or a yellow quartz crystal called false topaz. Ashestos may be a variety of hornblende, to which the name was originally given, or a variety of serpentine.

Miners often object to what they call long scientific words because they don't understand them. It is not, however, the length of the words so much as the confusion in the mind of the miner as to the exact meaning of the words that frightens him, because he is more accustomed to use his provincialisms rather than well selected words more suited for general practice in these days when miners travel about in different countries. Moreover, he frequently makes use of scientific words in his daily occupation, though probably he is not aware of it. When speaking of "pyrites," he little thinks it is derived from a Greek word meaning fire, given to it on account of the spark it emits when struck by steel; a phenomenon he observes every day, though perhaps it never enters his head to enquire the reason why. Sometimes confusion arises between the use of a term in its collective sense and special meaning. To again make use of our old friend pyrites as an example; it may be used as a family name for certain sulphides, *e. g.*, iron pyrites, copper pyrites, arsenical pyrites magnetic pyrites, tin pyrites, etc. or as a special name for one particular mineral, viz. iron pyrites.

There are few causes that have thrown so much discredit on theories applied to geological subjects as fallacious reasoning. We hear of arguments that simply bristle with logical fallacies, and are a cause of offence to our very instincts. Some argue from a special case to a general one, or *vice versa;* others assert a conclusion that has no connection with the proposition from which they argue; or assume one thing is the cause of another, without sufficient proof; in fact, the modes of reasoning which deceive are numerous, and their application various.

Reasoning gives us knowledge, and the best way to prepare ourselves for increasing such knowledge is to study our subject long and carefully from all sides; in other words, to saturate ourselves with it. The study of a subject, however, involves a knowledge of others; so, before we are in a position to argue thoroughly we must make ourselves masters of allied sciences. Intelligent and careful observation is the foundation of logical sequence, and it is by no means easy, even for the most honest observer, to prevent his wishes or opinions from coloring the true facts, by unconsciously placing too much stress on a favorite subject, and thus distorting facts by an unbalanced line of thought.

Certain phenomena which have been carefully studied and classified are reduced down to systems, which, for the sake of convenience we term "Laws of Nature." These laws are constant, and may be relied upon. Sometimes, however, it appears as if they did not always act when they should, but on investigation we find that one law has been temporarily modified by another. Take, for instance, gravity. The earth attracts bodies towards its center, but during volcanic eruptions we see bombs hurled up in spite of gravity, and still that universal force is acting all the time, and prevents the bombs from going as high as they otherwise would, and eventually, with the assistance of the friction of air, overcomes the transient superior force developed by the sudden expansion of gases, and the bombs fall to the ground. Here they come to rest for the time being, but the force of gravity is ready to drag them lower, if only their support were removed, and will also resist the efforts of those who attempt to raise them off the earth.

We may accept certain truths at once as axioms to assist us in our arguments, such as that there is no effect without a cause; that matter is never annihilated, but is simply altered or transplanted, etc. Phenomena occurring at the present day in connection with rock building are due to the same laws of nature that laid down similar deposits in ancient times; we remember, however, that conditions were not the same in degree as they are now. The first waters condensed were warmer than our oceans of the present day, and would, with their dissolved salts have a more powerful chemical action than the diluted cooler seas; also the terrestrial heat, overpowering the present effects of the solar heat, would nullify what we call seasons, and the want of these would in turn affect the formation of deposits, such as niter, that are to be found in arid districts.

There are two classes of reasoning known as Inductive and Deductive; they may be employed singly or combined, in order to get at the truth of matters. By inductive reasoning we first find out by observation, with the help of our senses, what is true of many different things; we then try, by proper reasoning to discover the laws which govern them by forming hypotheses. We must draw our conclusions, and finally verify them.

By deductive reasoning we do just the reverse; we find out what will happen in consequence of a so-called law of nature, if something else is true.

Unfortunately, life is not long enough for each person to observe and test everything for himself; we are, therefore, obliged to accept the work and conclusions of others, in many cases; but in doing so we cannot be too careful in the selection of the individuals whose results we accept, and should be satisfied that they are careful experimenters and observers, free from bias, and sound in their arguments. It is not necessary to see a thing actually done in order to prove how it was carried out; we may observe the result, and then by logical arguments be led to conclude how things were in past ages. Man did not happen to exist during the creation of the world; he can only get information on that point by reasoning. It does not do simply to wait and watch nature, as many of her actions are too slow for man to benefit by them during the limited span of his life, many ages being required to bring about results when left to themselves; besides, they are so frequently complicated that by leaving matters to observation alone, it is almost impossible to unravel the various phenomena concerned, so that we are forced to fall back upon experiments. Nothing must be considered too insignificant to be noted; the result of our conclusions may be stated in a few sentences and may appear very simple, and when the question is one of "Yes" or "No" you have equal chances in your favor, if you make a guess at the solution, which most persons are satisfied with doing; if however, you are a conscientious worker, the mass of evidence that accumulates is often enormous before you are satisfied that your contention is proved, and many of your observations have to be laid aside on further observation as foreign to the subject. We should first observe facts, without hampering them with theories; we are, however, so accustomed to rapid thinking that we are apt to jump to conclusions prematurely, and to note as observed facts whats are really our assumptions.

A man notes a rounded boulder on the top of a mountain; instead of stating facts as he really sees them, and describing its environments, if not a geologist, he will probably call it a waterworn block, and assume that it had been brought into that position by some great fluvial force. Or, again, he may observe a ferruginous concretion, loose in a rocky hollow, the entrance to which is too small to allow it to pass through, and wonder how a piece of shingle could get in through such a small space. Were he to note the surroundings, it is true he might find similar concretions loose in the soil in the beds of creeks or on the beach, which might appear as if their roundness were due to the action of water rolling them about; but closer observation would show these concretions in their matrix in various stages of formation. We not only want to know empirically that something happens, but we desire to ascertain why it happens; the origin of the results we see, and why out of all the possible combination of circumstances that suggest themselves to us, nature should have selected the one she has. In order to obtain this information we generally have to resort to experiments which increase our store of facts, and enable us to reason; in fact, we should always experimentalize when possible, so as to assist us in coming to a correct conclusion.

Things, the nature of which we desire to know can be regulated and combined in such a way that their actions under definite conditions can be observed. In this way, interfering with things, we got results more quickly than we otherwise would, and under conditions we might not be certain of in nature; besides, we might not be prepared to observe when the opportunity occurred. In experimenting for the discovery of laws governing nature, it is not always convenient to imitate her various irregularities, which would only cause confusion; we, therefore, adopt ideal cases for the sake of convenience, which generally takes some regular form with which we are acquainted, *e. g.*, experiments on capillary attraction are conveniently carried out in perfect cylinders, while investigations on falling bodies are generally conducted with spheres. Experiments are always liable to errors of manipulation, observation, and the choice of methods, which should be eliminated before deducing our points.

(*To be Continued.*)

Lumbering Scenes.

Our engravings offer glimpses of some features of lumbering operations in California. They show the sawmill set up in the midst of the giant trees, and the flume by which the sawed product is swiftly carried down from the almost inaccessible heights, where the lumber is sawn, to a shipping point upon the railway or beside navigable water. The scenes are characteristic of California, for probably nowhere else is lumbering carried on with so little expenditure for sawmill buildings and so much for water transportation of the product. The machinery of the mill is almost without sheltering roof, not to speak of sides. In this favoring climate, it is only necessary to secure firm foundations for the machines themselves, and strong constructions to transmit power from engine to saw pulleys. More than this, there is little thought of building. A sawmill is a scant affair anywhere, and hence the old saying "Cold as a sawmill," which many of us will remember from childhood, but in California the sawmill makes next to no pretension whatever of protection against weather of any kind.

SAWMILL IN THE PINE REGION OF THE SIERRA NEVADAS.

But what is saved on the mill and many times more is often expended on the flume. This, too, is a feature vastly more serviceable in California than elsewhere, because frost seldom touches the water in the flume, and it takes its swift flight in the middle of winter as well as in dogdays. It is seldom that even an icicle is formed by the water, which often drips from the timbers of the trestle. Another California advantage in the flume is that it carries both water and lumber to market, for after the water lands its load of lumber it often takes up a contract for motive power in a turbine, and is only finally at rest when it reaches the arid plain which it transforms into green fields, orchards and gardens by irrigation.

Our scenes are located in Butte county, where for many years there have been large lumbering enterprises, based upon the sugar pine of the Sierra Nevadas. All along the foothills on the eastern side of the Sacramento and San Joaquin valleys there are similar lumber-carrying enterprises, and the main lumber supply of the great valley is thus produced. Recently greater flumes than ever have been proposed; one of the largest is the enterprise which is to bring motive power to illuminate the city of Fresno, and to do other valuable work. Flumes are costly and they need constant repairing, but their work is done with such swiftness and certainty that the necessary investments are usually found profitable. Of course only a portion of the flume is carried on a trestle as depicted.

The flume shown in the engraving is sixty-two miles long and extends through two counties. It is only to cross depressions or to secure grade suitable to carry lumber far out upon the level plain that such timbering is required. Wherever possible the flume is built on the ground surface. Though usually the lumber and water get along well together and reach the end of the journey in good order, there are occasionally stoppages and a few carloads of timber may be shot down the side of an inaccessible gulch or strewn broadcast over a level field. It would sometimes cost more than this lumber is worth to regain it, so that driftwood lies along the length of the flume as thickly as along the beach of a well-wooded coast.

LUMBER FLUME FROM THE MOUNTAINS TO MOORE'S STATION, BUTTE COUNTY.

SCIENTISTS are coming to the conviction that the ruins found in Mashonaland, South Africa, are of Semitic and Arabian origin, and that the negroid race had nothing more to do with their construction than as the slaves of a race of higher cultivation.

Sale of Portion of Mining Claim.

If the locator of a mining claim should convey a portion of his claim, without any reservation in his deed of conveyance, his grantee would be entitled to all the gold that might be found within the ground conveyed, in any vein whose apex was within the surface lines of his deed. So if a locator should convey to A the east half of his claim, and afterwards should convey the west half to B, each of his grantees would, in the same manner, be entitled to all of the gold found in any vein which was entirely within lines of his conveyance, and, on the same principle, if the proprietor of a tract of mineral ground which has been derived through several locations should dispose of the same in parcels, irrespective of the lines of such locations, the right of his grantees would be measured by the terms of their deeds. In such cases Section 2336 of the Revised Statutes of the United States is subject to the characteristics of mining property given to it by prevailing customs, and not with the absolute dominion which flows from a conveyance in fee of ordinary land. The mining land thus granted is still subject to all mining laws and customs which are applicable, but the provision of Section 2336 that, when two veins intersect, "priority of title shall govern, and such prior location shall be entitled to all ore or mineral contained within the space of intersection," cannot possibly be applied to the case where A conveys part of his mining claim to B, for in such a case there is no "prior location." Therefore in such a case the ordinary rules which govern grants of land must, of necessity, apply, and if the intersection takes place on part of the claim conveyed the grantee takes all the mineral within the space of intersection. —*Stinchfield v. Gillis (Supreme Court of California) 40 Pac. Rep., 98.*

IN New York City there are about 500 venders of sawdust, having a capital of $200,000 invested, and doing a business of $2,000,000 annually. Forty years ago the mills were glad to have sawdust carted away; twenty-five years ago it could be bought for 50 cents a load; now it brings $3 50 a load at the mills. It is used at hotels, eating houses, groceries, and other business places. It is wet and spread over floors to make the sweeping cleaner work. Plumbers use it a great deal about pipes and buildings to deaden the walls and floors. Soda water men and packers of glass and small articles of every kind use it, and dolls are stuffed with it. Yellow pine makes the best sawdust, as it is the least dusty and has a pungent, healthy smell. But any light wood will do. Black walnut sawdust will not sell and is burned.

Mining Summary.

CALIFORNIA.

Calaveras.

THE PURE QUILL MINE.—Salt Lake *Tribune:* Sam Godhe returned to Salt Lake lately after an absence of three weeks, which was spent on the works of the Pure Quill mine in Calaveras county, Cal. He says that the Pure Quill don't helie its name, and is to-day one of the hest prospects on the mother lode. The shaft is now down seventy-five feet, and a stream hoist is heing erected which will soon he in operation. A test run was recently made on the ore and showed a value in gold of $13.75 per ton, from ores taken out from a complete crosscut of the vein.

Mr Godhe states that while there is considerable milling done around the vicinity in which the Pure Quill is located, there is but little practical mining conducted. The reason, as he puts it, is that mining as it is generally understood is unnecessary. The ore lies very close to the surface, and instead of mining it, it is quarried out and transported to the mills. The entire ore is free milling in character, and so large are the ore hodies that, says Mr. Godhe, some of the mines are actually mining and milling their ores at an average cost of 65 cents per ton. The average run of ore to the stamp is from three to five tons per day.

Mr. Godhe will remain here about ten days, and will then return to the Pure Quill.

THE BOVEE.—The Bovee mine, hetween Angels and Altaville, has been reopened under the superintendency of Edward McKay. This property has heen idle for over ten years. There is a shaft 230 feet deep.

EL ENCINO MINE.—At this mine work has been pushed night and day under the management of James Regan, driving a hedrock tunnel for drainage. The tunnel is through the rim of the channel and within 75 feet of shaft No. 1, which is on the southern end of the company's property. For over 1100 feet the tunnel was in very hard rock. Five air shafts were put down, to give ventilation and draw off the smoke. The head of the tunnel is in a soft formation requiring timhering. When shaft No. 1 is connected the company intends driving up channel a distance of 900 feet, to the present pump and working shafts. When this is done the mine will he operated on a large scale—hoisting the gravel at different points and crushing with stamps. F. Chappellett is the president and general manager of the company.

Inyo.

THE NEW RATES.—*Register:* The new rate of $13 per ton for working charges on lead ores hy Selhy & Co. at Vallejo Junctiou is generally accepted as very reasonahle hy mine owners and shippers in this and Darwin districts.

Nevada.

THE CROWN POINT SOLD.—A. Gauthier has heen paid several thousand dollars as a first installment on the purchase price of the Crown Point. It is expected that new machinery will he put in hy the new owners.

TO BE DEVELOPED.—*Union:* Peter Tautphaus, one of the prominent owners of the Providence mine, Nevada City, has arranged to purchase the Constitution and three other mines in a group, in the Willow Valley district. He will put up temporary works this fall, and next spring will proceed to erect an extensive plant preparatory to a thorough development and working of his properties.

Plumas.

GOLD BAR CONSOLIDATED CO.—Special correspondence.—The machinery for the Gold Bar Consolidated Mining Company has arrived at Gold Bar Camp, via Marysville, and will he made ready for operation at once. It consists of an improved tank pump, capacity 800 gallons per minute; a douhle-cylinder friction drum horizontal engine of 15 horse power, and a portahle steel hoiler of 30 horse power: As this will be next to the initial move in opening up a vast property a hrief description of the location may he in order. On the middle fork of the Feather river, 23 miles from La Porte and ahout 12 miles from Onion valley, hetween the mouths of Onion Valley and Washington creeks, there are a series of deep hars extending along this river for a distance of ahout eight miles. The surface on most of these hars has heen worked over by the early argonauts, but the methods then in vogue precluded the possihility of decp river mining, and so the rich hedrock was left undisturhed for the touch of modern mining machinery.

Some time ago A. U. Rugg, a mining engineer and a practical river miner of Plumas Co., secured the right to mine the property. The Gold Bar Consolidated Mining Company, with headquarters in San Francisco, was the first to commence operations on one of the hars, which has since hecome known as Gold Bar. It is situated just helow the famous Cleghorn har and on the opposite side of the river. A 20-horse power hoiler, with a horizontal engine coupled with friction gearing, and a centrifugal pump with a capacity of 40,000 gallons per hour, were set to work and a shaft put to hedrock, which was found at a depth of 29 feet. The result was sufficient to induce the company to order heavier machinery, which has just arrived. The bar is to be worked hy a series of open cuts, water for working and other purposes heing brought across the bar hy a 14-inch flume from the river ahove.

A similar method will he used in working the other hars, which are owned hy different companies, several of which are now engaged in preliminary work. A good road has just heen completed, leading out of the canyon to connect with the road to Onion valley, and it is now a pleasant drive of 2¼ hours from the latter point to the mine. The snowfall in this canyon is very light, and work ean be carried on the year round, an advantage enjoyed by no other section of Plumas Co. The force at Gold Bar is heing increased as fast as it is possihle to get good river miners—a rather scarce article, hy the way, in Plumas Co. just at present.

OPERATIONS AT SLATE CREEK.—Special correspondence.—W. J. Scrutton, superintendent of the Slate Creek Gravel Gold Mining Company, operating for the past three years on Slate creek, near La Porte, reports that the past season was an unprofitable one for his company, owing to the late snows and a freshet during the month of May that washed tailings over a large area of bedrock, uecessitating a second handling at great expense. Work commenced in Februarv, and the season was late. It required nearly two months, witb a large force of men, to place the hydraulic elevators. This work was accomplished hy shoveling snow which packed the creek to a depth of 40 feet. The run commenced in April, with a heavy hurden of expense already piled up on account of the "dead" work in handling snow, and continued for two months and a half, when the water gave out.

During this time ahout 14,000 cuhic yards of tailings were handled, of which some 6000 cuhie yards were washed down hy the May flood, making another item of "dead" work. The prospect for next season is hrighter, when an entirely new method will be adopted. The depth of the tailings, at the point now reached on Slate creek, precludes the possihility of using hydraulic elevators to advantage, and hereafter a tunnel will be used, for which the entire volume of water in the creek will he utilized. Operations next year will he commenced about the first of May. Two or three monitors are to he used for the purpose of sweeping the tailings into the middle of the creek.

AT LA PORTE.—J. H. Thomas has begun the opening of a hig mine near La Porte. Two large ditches that were used for some years will he reopened and put in condition for use next spring. One of these, known as Feather River Ditch, is seventeen miles long, while the other is hut little shorter. A strong dam will be constructed for restraining the debris and when all is completed he expects to hegin hydraulic mining on his mine.

Riverside.

THE GOOD HOPE.—*Record:* Ahout 45 men are now at work in the Good Hope, most of whom have leased ground and are working it for all there is in it. They work in pairs and the ore they take out is milled for $3 per ton, and they also pay a royalty to the company of 20 per cent. Some very rieh ore has heen struck in pockets, and some of the men have made as high as $6 and $7 per day in wages. This will not average all through, however.

San Diego.

ATTACHED.—The sheriff has levied an attachment on the Cargo Muchacho mine, owned hy the Paymaster Company, to secure the payment of a claim for $5000 alleged to he due Hass & Burt of Los Angeles for supplies. The property levied upon also included eight miles of pipe line connecting the mine with the Colorado river, and a carload of supplies at Ogilhy station.

THE GOLDEN CROSS.—*Sentinel:* The Golden Cross people started up 50 stamps of the 100-stamp mill. The machinery worked perfectly and everything gave complete satisfaction. As soon as the new pipe line is completed, which will he within a few weeks, the entire plant of 140 stamps will he droping upon ore from one of the higgest gold mines in the country. Taking the working of the old mill as a guide it is safe to say the output from the old and new mill combined will reach $125,000 monthly.

Shasta.

THE WASHINGTON MINE.—*Free Press:* The Washington mine at French Gulch shut down on the 12th inst. and all their men laid off. It is stated that another payment of $15,000 on the purchase price of the mine will soon he due.

PROPERTIES BONDED.—The *Democrat* hears that a wealthy syndicate have honded the old Greene mine at French Gulch and the Jay Eye See. It is expected that these two mines will he extensively worked.

A TALC MINE.—W. P. Bartlett has leased the talc mine on Flume creek for one year, will pay Mr. Conant a royalty of 50 cents per ton for the output and has begun operations. Talc is used for giving to paper the fine finished gloss, and must he free from all foreign matter which might tend to stain the pulp. The vein at Flume creek is fifty feet wide.

A NEW MINING CAMP.—*Free Press:* Conant & Fowler in Harrison Gulch have a ledge of free milling gold ore three feet in width the croppings of which can he followed for a distance of 2800 feet. The ore will mill $50 to the ton. Twelve tons, which were run through an arrastra, yielded $700. Conant & Fowler have purchased 21,000 feet of lumher with which to erect houses and a mill. They have purchased a Kendall patent quartz mill of a capacity of eight tons per day. They will have the mill in operation within thirty days, but will replace it with a stamp mill early in the spring.

There are five houses now in course of construction at Harrison Gulch. Two of these are large two-story buildings.

This new mining camp is situated on the headwaters of Cottonwood creek, in the extreme southwestern part of the couuty, about a mile and a half from the line hetween Shasta and Trinity counties, and two miles from the Hay Fork and Red Bluff road, with which a connecting road is now heing built.

The distance from this city to the mines is estimated at fifty-five miles.

Sierra.

PROPERTIES BONDED.—J. F. Parkinson of Palo Alto and F. Hall of this city have bouded the Wm. Tell and Butte Saddle Rock mines at Sierra City.

THE EL DORADO.—At the El Dorado, near Alleghany, a 10-stamp mill run hy water power is in constant operation. The ore shoot is three feet in width and averages $14 to the ton.

Trinity.

MINING PROPERTY CHANGES HANDS.—*Journal:* An agreement is made hetween F. Huertevant, who has recently purchased so many valuahle mining properties in the vicinity of Junction City, and W. Mahoney and J. C. Wallace for the purchase of the latter's placer mines, ditches, water rights, etc., ahove Canon creek. Under the terms of the agreement Mr. Huertevant takes possession at once, with full power over the property. The final payment will not he made until Octoher, 1898.

CRUSHING ORE.—*Journal:* The new five-stamp mill on the Vollmers & Doty mine, near Trinity Center, is at work. The ore is packed from the mine hy twenty mules, which carry five tons each trip, at a cost of $2 a ton.

Tuolumne.

GENERAL NOTES.—*Independent:* At the Shanghai the old works have heen tapped, and, at a depth of seventy-five feet from the collar of the shaft, water has been reached. Below the water level the timhers, ladders, skipways, etc., are as sound as when over twenty years ago the rich ore was hoisted to the surface. A steam pump will soon be placed in position. A string of mines adjoining will greatly appreciate in value should the prospecting in the Shanghai develop into what everyhody expects it to. Among these locations are: The Morgan, the Orion, the Wild Missourian, the Rihbon Rock, the Old Tuolumne and the Midas.

The Possihle mine is heing developed by A. S. Graham. A shaft ahout 100 feet deep has heen sunk, and the vein, though small, is rich.

The Star mine, after having lain idle for years, has heen developed into a very valuahle piece of property. Through the instrumentality of W. B. Moore, the Messrs. Williams of San Francisco have opened up the old works and prospected new ground, heing rewarded hy striking chutes of ore. Rock has been tested at the Sonora chlorination plant, and flattering results ohtained. A carload will he sent to the Selhy Company, San Franciseo. A 10-stamp mill is heing huilt at the Star under the supervision of Jas. Hamilton, and nearly fifty men are on the payroll.

THE WASHINGTON BONDED.—E. A. Stent has honded the Lady Washington mine, in Summerville distriet, and will hegin developing the property on an extensive seale at once.

NEVADA.

ESMERALDA COUNTY.

MORE NEGOTIATIONS.—James Yerington is again in Silver Star district with a party of capitalists, who will meet the mine owners at Sodaville and endeavor to hring about a sale.

LANDER COUNTY.

THE AUSTIN MINING CO.—President Stokes of the Austin Mining Company tells the *Reveille* that he desired that 1000 men he employed hy the company in the next fourteen months. He was asked if his purse would meet the demands of the employment of 1000 men, and his answer was, "Yes; put them to work and I will furnish the money." There are from $15,000 to $20,000 paid out hy the company now each month. Ahout 70 men are employed, and it is expected that the force will he increased to 100.

LINCOLN COUNTY.

DE LAMAR DISTRICT—(Special Correspondence).—Capt. J. R. De Lamar was here last week, when he made a thorough inspection of his property here. He went through the mine and was very well pleased with what he saw, and well he might, as in some of the drifts there is 50 feet of ore, which gives bullion returns of $25 to the ton. No. 10 tunnel, which is in 2000 feet, most of the way in ore, taps the ledge at a depth of ahout 600 feet, so that there are a great many thousand tons of ore in sight. The captain has spared no expense in opening up his mine. Everything is done in a thorough, miner-like manner. Of course, he will reap the reward from this in the future. The mine at present, although a great deal of development work is heing done all the time, pays a handsome dividend. The eaptain has heen experimenting for the past six months on a new process, and will now adopt it, as it suits the De Lamar ores the hest. The mill has heen increased to douhle its capacity, and after this week will treat 200 tons of ore per day.

Frank Wilson has purchased another one-third interest in the April Fool group of mines. This gives him two-thirds interest in this valuable property, which is said to he as good as the De Lamar Company's mine. A mill will he erected at once by this company.

Several claims are heing surveyed for patent which take in the greater portion of the town. The owners of lots will contest these patents, as it is claimed that a patent is not sought for this ground on account of the mineral it contains, hut for speculative purposes.

Outside capital has commenced to place an eye upon this camp, and hefore next spring we expect to see another good company in here, doing active work. Building is going on as fast as the sawmill can furnish the lumher. Two-story hricks are also heing huilt.

OREGON.

GENERAL NOTES.—C. P. Church of Portland has taken an option on 1100 acres of placer land in the western part of Josephine county. The price agreed on is $45,000, of which $5,000 has already heen paid.

The Tolo Mining Co. will resume work on their quartz ledge, and operate it on a larger scale than ever.

Lewis Catching has leased the Myrtle creek mines for the ensuing year, says the Rosehurg *Review*, and will run three pipes during the coming winter.

Superintendent McNally of the Virtue mine brought into Baker City Saturday gold bullion amounting to $12,000, the output of the mine for 22 days on low-grade ore.

WALNO COPPER MINES.—All the machinery for the copper mines near Waldo has arrived, and the smelter at the Siskiyou mine will he in operation next week.

LINN COUNTY.

THE SANTIAM MINES.—In the White Bull mine, worked by an English syndicate, wire gold has been found. The English company, under the management of Mr. Lawler, is running three tunnels to connect the White Bull and Red Bull mines. Shafts have also been suuk, and they have 500 to 700 tons of ore on the dump and nearly 100 men at work.

WASHINGTON.

THE IRON KING.—The owners of the Iron King mine on Palmer mountain, Okauogan county, have put men at work to siuk 100 feet and test the value of the claim. The surfaee ore assayed $2.50 in gold, 5 per cont copper and 5 per cent uickel.

IN SULTAN BASIN.—Colonel A. N. Hamilton of Seattle says the Sultan Basin and Stillaguamish Mining Company, owning the Little Chief, reports that there are now $1,000,000 of ore in sight. A small force of men will be kept husy the coming winter and in the spring fifty miners will he employed. A spur will ho huilt from the Great Northern to the mines, 23 miles up the Sultan river from Sultan City.

BRITISH COLUMBIA.

GENERAL NOTES.—The wire tramway from the Hall mines to Nelson will he completed within two weeks.

The *Tribune* gives the total west Kootenay ore shipment for the year at 20,299 tons, valued at $1,706,500.

The Kootenay, Copper Jack and Tip Top mineral claims at Trail are sold for $40,000 cash.

The Alamo, in the Slocan, has paid its first dividend of $35,000.

A concentrator of 50 tons daily capacity is huilding at the Washington, Slocan. It will he finished in 90 days.

The government will dredge the Lardeau and Duncan rivers for 40 miles above Kootenay lake, thus extending navigation 60 miles.

Thirty-eight claims have heen staked this summer on Cariboo creek, which runs into the Columhia 20 miles south of Nakusp, and several on Mineral creek, a tributary. Placer mining has heen practically ahandoned. The Golden Eagle has a strong ledge, the iron capping of which shows $10 to $15 to the ton. On the Promistoria, on Mineral creek, streaks running $167 in gold have heen found, hut they are not permanent. The owners, Demers, Bourne & Road, have refused a working hond of $15,000 on the property. The War Eagle runs at $6.25 in gold and $80 in silver. Snow has fallen and work is practically stopped until next spring.

A MICA MINE. — Kamloops *Sentinel:* The pack train that returned on Friday last from the Tete Jeune cache, hringing 1,500 pounds of mica, will show whether or not with present means of travel and transportation that property can he worked successfully and profitably. This mica is said to be of exceptional good quality, in pieces large enough to furnish clear sheets squared to 12x18 inches.

NINE MILES LONG.—The cable for the Hall mines tramway, near Nelson, was spliced last week, and is now an endless chain of nine miles, supported on 123 towers, its upper end heing 4,500 feet ahove its lower. There will he 900 huckets.

The Nelson *Tribune* reads a lecture to a Slocan claim owner who has 100 tons of ore on the dump, yet is waiting for the government to huild a trail for them at a cost of $1,500. Men with no push, the *Tribune* says, are of no use in this world and should be preparing for the next.

Some of the greatest financiers in Europe are shareholders in the Lilooet-Fraser River Cariboo Gold Fields Company. Among them are Henri Rosenheim, the principal controller of Society Generale, Jules Baron de Machiels, senior partner of Jules de Machiels & Cie, Gustace Baron de Rothchilds and Baron de Hirsh.

A TRAIL CREEK SALE.—The Cliff mine and Consolidated have heen sold hy Spokane owners to F. T. Barnard of Vancouver. The reported price paid for the Consolidated is $75,000 and for the Cliff $150,000.

ALASKA.

ELECTRICAL PLANT FOR BERNER'S BAY.—The Great Northern Express Company yesterday reeeived one of the largest express packages that ever came to the city, says the Seattle *News*. The hox weighed 3050 pounds and was consigned to the Berner's Bay Milling and Mining Company, Juneau, Alaska. It consisted of an electric light plant from a firm at Scheuectady, N. Y., and will he used in the company's mine at Berner's hay. The shipment arrived in time to he put aboard the steamsbip Alki and will therefore reach Juneau in eight or nine days from the day it left Schenectady.

UTAH.

A SALE OF TAILINGS.—Park *Record:* The hig tailings dump below the Anchor concentrator, containing some 15,000 tons, and carrying silver, lead and zinc, has heen sold to Eastern parties, and arrangements are heing made to work it. The sale was made on a cash hasis, and includes all the tailings the mill may produce. Zinc is the predominant metal in the tailings, and will require a special plant for its extraction, and as it will he considerahle cheaper to huild here than to ship the product, a plant will probahly he constructed.

IDAHO.

CAMAS NO 2.—Superintendent Wood of the Camas No. 2 mine, near Hailey, Idaho, says the 20 stamps are working regularly. He contemplates putting in 20 additional stamps in his mill. These, he thinks, can he run with the water supply now available. More stamps could not. The drift on the 400-foot level has

penetrated the ore body 40 feet. The ore averages $35 per ton. There are over 800 cords of wood on hand at the mill and contracts are let for 700 cords additional. This is about a year's supply, the mill burning 90 and the mine 30 cords a month.

MONTANA.

TO CONSOLIDATE.—The Cœur d'Alene Silver-Lead Mining Company has voted to consolidate the Tiger and Poorman properties and to capitalize the concern at 1,000,000 shares of the par value of $1 each, 500,000 to each mine, and each stockholder in the Poorman to receive the same number of shares as now held.

THE SNOW SHOE MINE.—The Chicago and Montana Mining Company, who are operating the Snow Shoe mine, have 265,000 feet of lumber on the ground for the concentrator, and 200,000 feet more is contracted for. The ore in the mine is improving in quality, the assays now running $60 to the ton.

IN BASIN CREEK.—The Merrill G. M. Co. has organized with $100,000 capital to work the Neptune and Venus mines, at the head of Basin creek. A 10-stamp mill will be immediately built.

WYOMING.

OPENED THE FOUR-MILE CANAL.—The revival in the gold-mining industry near Cheyenne was marked last Saturday by the opening of a large four-mile canal, which has been constructed by Eastern capitalists for the purpose of furnishing water for washing 1500 acres of gold placers, yielding from 20 to 80 cents per cubic yard, and from 12 to 30 feet deep.

ARKANSAS.

ARKANSAS ZINC MINES.—Gov. Fishback says there are 216 square miles of zinc in the Arkansas field. Occasionally a man will claim that the region has been well prospected. He means that the prospectors have walked over the mountain slopes and up and down the creeks, locating claims where they found ore sticking out of the ground and where the crack of the hammer on an outcrop exposed the mineral. Of prospecting in the sense that the word is used by the miners of other fields, that region knows nothing. Mineral Surveyor Hamilton has made an examination of some of the principal prospects. He found 75,000 tons of zinc ore on the dumps and 220,000 tons in sight. The labor expended in producing this result represented but a small fraction of the value of the ore.

COLORADO.

A NEW INCORPORATION.—D. Sullivan, S. T. Burke and H. C. Bolsinger have incorporated the Vendome Mining Company and bought all the properties of the Herbert Mining Company and some adjacent mines, comprising about 40 acres in Gilpin county. The price paid is $400,000.

NEW COMPANIES ORGANIZED.—Two new companies have been organized in London to operate in Cripple Creek district—the Cripple Creek Exportation Syndicate, limited, capitalized at £30,000, with shares at £1 each, and the Cripple Creek Gold Mines, limited, with £100,000 and shares at £1 each.

CRIPPLE CREEK DISTRICT.

Mail: Paris, France, capitalists have bought the Mattie D. and Ingham lodes, $125,000 cash being paid for them. Six months ago the Mattie D. was bonded for $40,000, payable in four months, and at the same time the same parties bonded the Ingham for $30,000. Time expired on the former sixty days ago, but a cash payment of $4000 got an extension of two months. The limit was reached, but another extension was gained by raising the bond $50,000. The properties have been worked right along and are located on the northwest slope of Raven hill, adjoining the Doctor.

ARIZONA.

HARLAN'S MILLS.—W. H. Harlan is operating two small mills and building a third one on Groom creek, near Prescott, to be run on custom ore. Next summer he intends to put up a small reduction plant in connection with his mills, and instead of being compelled to ship concentrates will smelt them there.

Personal.

SAM'L THOMAS, president of the Ohio Southern Railway Co., is only 22 years old.

PROF. BLAKE of New York is the new incumbent of the chair of geology in the university of Arizona.

A. S. HALLIDIE left Nelson, B. C., last Tuesday for Boston. He expects to return to San Francisco about Nov. 10th.

F. I. HELLMAN, who recently left Virginia City, Nev., for South Africa, is superintendent of a mine 40 miles from Johannesburg.

R. R. WHEELER, late superintendent of the Golden Cross at Hedges, has present charge of operations at the Santa Rosa, Riverside county.

J. H. TIBBITTS, who has been doing field work for the State Mining Bureau, goes to South Africa to superintend a mine at an annual salary of $8000.

TAYLOR D. MACLEOD has resigned the superintendency of the Green Mountain mine, Plumas Co., and will give attention to his San Diego Co. properties.

R. H. CAMPBELL is examining the Horsefly property, Carihoo, B. C., where he proposes to put in a hydraulic elevator, similar to the one in operation at Quartz Valley, Siskiyou Co.

C. R. JOHNSON of the Union Iron Works sailed for Buluwayo, Matabeleland, South Africa, this week, where he will superintend the erection of some California gold mining machinery for C. Jefferson Clark.

HUGH MCDONNELL, credited with having engineered the sale of the Iron Mountain property to its English purchasers, is in Redding, and the *Democrat* declares another big sale of mining property will shortly be reported.

Coast Industrial Notes.

—Demarest & Co., of Altavillo, are about to build a foundry at Jamestown, Cal.

—The British Columbia seal catch of '95 aggregates 72,414, worth on an average of $10.50 each.

—The *Californian* says that at a recent horse sale in Bakersfield a pair of big horses sold for $2.

—The rate on flour from Sacramento to Colfax, a distance of only fifty-four miles, is $4.80 per ton.

—Portland, Or., figures up a population of 81,342—making it the second city on the coast in point of size.

—A new camp has been started and fifty more men put to work on the Portland and Astoria railroad.

—The People's Telephone Co. has incorporated at San Jose; Capital stock $50,000; object to build a telephone system in that city to connect with the system of the California Telephone Construction Co.

—The San Francisco demand for Los Angeles oil increases. In September the S. P. Co. brought here twenty-five carloads. So far this month, nearly twice that amount has been received. Arrangements are now in progress to insure successful water transportation.

—Two rival enterprises propose to connect Oakland with the San Francisco and San Joaquin Valley Road. E. P. Vandercook has a franchise for a line, to be operated by electricity, to run via Livermore and Corral Hollow to Stockton, which will shorten the distance between San Francisco and Stockton fifteen miles, standard gauge and equipped for passengers.

—The largest cannon in America is at the Union Iron Works at the Potrero, awaiting its installation in one of the main turrets of the battleship Oregon. The Oregon is awaiting its turret armor and its builders are awaiting about $500,000 of their money, still in the Government vaults, to be paid when the Government finally accepts the vessel, which acceptance is indefinitely delayed by the Government's failure to furnish material.

—The Northern Pacific will soon begin laying the 1400 miles of new steel track which the report of ex-Receivers Oakes, Rouse and Payne, recently filed with Judge Jenkins, states will be necessary during the next five years to keep the road in good condition. The cost, according to their report, after deducting the value of rails taken up, will be $2,500,000. The purchasing department has awarded contracts supplying 500,000 ties during the next year to W. C. Davies of Tacoma and S. T. F. Greenough of Missoula, Mont. The ties are to be laid when the first of the new rails are put down.

A Question Answered.

TO THE EDITOR:—Please answer through your columns the following query and oblige many readers, viz.: If John Doe has not done his assessment work for the year of '94, and has not relocated his claim by having it recorded again in the mining district and county, and Richard Roe comes along in '95 and "jumps" his claim, *i. e.*, puts up a notice of location, has it recorded in the mining district, and with the county recorder, is not his claim valid, and has not John Doe lost his right therein? SUBSCRIBER.

San Francisco, Oct. 23, '95.

The neglect or refusal of John Doe to do any work on his claim in '94 does not in any way affect any of his rights in and to that claim. A congressional act suspended the assessment requirements of the Federal Statutes regarding required annual work on claims in and for '93, and again in and for '94. John Doe was not required to do any assessment work on his claim in '93, nor in '94, and has sixty-six days left to do his annual assessment work for '95, if he has not already put $100 worth of work or improvements thereon since the 1st of last January. Failure so to do would render his claim liable to relocation on January 1st, '96, but not till then.

Commercial Paragraphs.

In last week's issue, in an item regarding a contract of the Niagara Falls Hydraulic Power and Manufacturing Co. with Jas. Leffel & Co., of Springfield, O., for four of their improved double discharge, horizontal shaft turbine wheels, they were stated to be 7500 H. P. capacity. Subsequent data received concerning the matter is to the effect that the wheels are to be of 8000 H. P. under a maximum head pressure of 218 feet.

Under date of Aug. 2, '95, Secretary W. H. Payson of the Bald Eagle Mining Co. writes as follows to the Western Manufacturing Co., 114 and 116 Mission street, this city: "We take pleasure in informing you that the two 2-stamp Briggs quartz mills which we purchased from you for our Bald Eagle mine at Sumdum, Alaska, have so far been very satisfactory. The mills were erected on the 1st of June last, and our average for the month of June was 18 tons per 24 hours, and we are now averaging 20 tons per 24 hours, or 5 tons to the stamp. This is fully equal to what you represented the mills would do, and is a remarkable showing, considering the fact that it was the first month's run and there is always a little delay in getting the machinery into running order. We shall take pleasure in recommending your mills to those who enquire of us."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCTOBER 15, 1895.

548,025.—STREET CAR BRAKE—H. T. Atkinson, Oakland, Cal.
548,110.—SASH FASTENER—L. L. Bettys, Berkeley, Cal.
548,029.—SACK FILLING MACHINE—Bibb & Timewell, Spokane, Wash.
548,033.—SAW SET—J. A. Campbell, Asotin, Wash.
548,050.—FURNACE DOOR—E. W. Harris, Palisade, Nev.
547,789.—FELLY EXPANDER—C. Hoffman, Spokane, Wash.
548,058.—RECOVERING CYANIDES.—B. Hunt, Wickenburg, Ariz.
548,074.—TROLLEY ROPE—C. A. Lord, S. F.
548,078.—CURRENT PUMP—L. E. Miller, Los Angeles, Cal.
548,091.—SAWMILL—T. T. Rainford, Tacoma, Wash.
548,016.—PULVERIZING MILL—F. N. Speer, Los Angeles, Cal.
547,971.—SAW SHARPENER—P. F. Toppendorff, Scotia, Cal.
547,823.—RAILWAY—D. S. Van Slyke, Los Angeles, Cal.
548,102.—SAFETY GUARD FOR CARS—W. Watkins, S. F.
548,150.—ORE EXTRACTOR—Williams & Phillips, Seattle, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SIDEHILL PLOW.—Albert D. Williams, Lafayette, Cal. No. 547,192. Dated Oct. 1, 1895. This plow consists of a frame having pivoted to its beam a tilting or rocking lever, from the extremities of which are supported plow bottoms, one at each end, said plow bottoms being reversed with respect to each other and adapted, by means of the rocking or tilting of the lever, to be alternately raised and depressed, so that while one is working in one direction the other is raised up out of the way, and when the other is working in the other direction the first is raised up out of the way. In order to change the team from end to end, there is a guide rail on one side, secured at each end to the frame, and a draft link sliding on the rail. The beam wheel has means for raising and lowering it, and it will remain equidistant between the plow bottoms. The small wheel opposite the main wheel has means for adjusting it, so as to tend to throw the plow to the land. The object of the invention is to provide a simple and effective plow for sidehills adapted to be readily reversed without having to turn the entire frame or to loosen fastenings, for the purpose of turning the plow bottom on its own axis.

MACHINE FOR WASHING, PRICKING AND SPREADING FRUIT.—William C. Anderson, San Jose, Cal. No. 547,194. Dated Oct. 1, 1895. This machine, as its name implies, has for its combined object the preliminary washing, the subsequent pricking and the final spreading of fruit onto trays, particular reference being made to the preparation of prunes for the drying process. The machine consists essentially in the combination of means for first washing the fruit, with means for puncturing the skin after the fruit is washed. Added to these features are means for spreading the washed and punctured fruit on trays. In the operation of the machine the prunes pass over a grating through which the debris falls. They then fall upon the vibrating fingers which direct them to a traveling carrier. The fingers and the lower end of the carrier operate in a water bath, so that the prunes are washed. Being raised up out of the bath by the carrier, they are next delivered to a shaking table provided with pricking points, whereby in their passage over the table they are punctured. From the table they are delivered into a distributing hopper and thence to the trays.

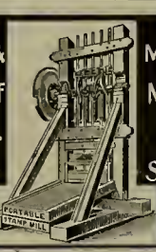
BARBED WIRE STRETCHER.—Hiram L. Farrier, Oakland, Cal., assignor of one-fourth to Charles W. Kellogg, San Francisco, Cal. No. 547,340. Dated Oct. 1, 1895. The object of this invention is to provide a convenient implement for use in putting up barbed wire fences, and by which the posts may be set, the wire conveyed from post to post and stretched and fastened thereon without the aid of supplemental posts or attachments. It consists of a barb having a tamper fixed at one end, a crowbar at the other, and a mechanism to clamp the wire, with a guide to prevent the wire from slipping from the clamp, and fulcrum bars upon the side of the lever, near the clamp, by which it can be used to grip and stretch the wire between the posts while being fastened.

AGENT IN SAN FRANCISCO:
NEWTON M. BELL, 109 California Street.

A Full Assortment of Wire Rope for Mining Purposes carried in San Francisco.

THE WILSON
HIGH GRADE STEEL
SHOES
—AND—
DIES.

Guaranteed to Wear Longer and Prove Cheaper than any others.



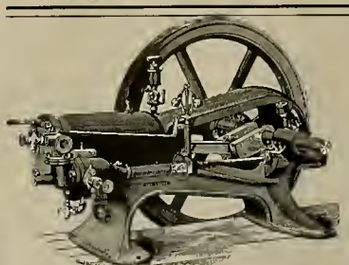
Made by use of Special Appliances.

PATENTED AUGUST 16TH, 1892.

—Made only by—

Western Forge and Rolling Mills,
ST. LOUIS, MO.
WM. A. HEWITT, - - Agent,
11 and 13 First St., San Francisco.

HENDRIE & BOLTHOFF MFG. CO. DENVER COLO.



MINING, MILLING & SMELTING SUPPLIES

RUPTURE CURED!
NO DANGER. NO OPERATION. NO PAIN.
No Detention from Business.
QUICKLY! PERFECTLY! PERMANENTLY!
NO PAY UNTIL CURED.
J. C. ANTHONY, M. D.,
San Francisco Offices, Suite 86 and 87, Chronicle Building.

Hydraulic Mine for Sale.
Not on a navigable stream; in northern California. Good dump; no trouble with tailings; 180 acres of mining ground; 5000 inches of water. Can work eight months in the year. Ample opportunity given a buyer to fully test the property before payment is made. For further details,
Address X, 2022 W St., Sacramento, Cal.

For a number of years THE SETH THOMAS CLOCK CO., of Thomaston Conn., has done a good deal of work for Electrical Companies, and would be glad to increase this line of business They will make estimates for any article akin to clock work for which a model is furnished and which is wanted in quantities. Address SETH THOMAS CLOCK CO., 49 Maiden Lane, New York.

PERKINS'
GAS, GASOLINE OR OIL
ENGINE.
Modern, Economical, Reliable. Leads all others in few parts and low prices. Adapted to every purpose where power is required.
PERKINS PUMP AND ENGINE CO.,
117 Main Street.....San Francisco.

DEWEY & CO., PATENT SOLICITORS.
220 Market St., San Francisco, Cal.

Scientific Progress.

Testing Pacific Coast Timber.

Many requests for information relative to the resistance to the several stresses occurring in construction, which is offered by our California redwood (*Sequoia Sempervirens*), have been received at the new civil eugineering laboratory of the department of civil engineering, University of California, since it has become known that they are engaged in testing various building materials, and in consequence, the following abstract of results, as obtained from the first set of tests upon redwood, is issued for the benefit of the engineers, architects, contractors, builders and others, on this coast and elsewhere, who may have occasion to use, in some new or peculiar way, this well-known material.

The tests were made in the civil engineering laboratory, by means of the new Olsen Universal automatic and autographic testing machine, of 200,000 pounds capacity.

The series of tests will be continued at length, in order to fully develop the characteristics of redwood, as well as those of other Pacific coast timbers.

The following are tests of Humboldt redwood, presented to the laboratory by Mr. C. D. Henny, of the Excelsior Redwood Company, Fourth and Channel streets, San Francisco, Cal. The pieces were clear, straight-grained, well air-seasoned and dry:

Average specific gravity of 126 pieces	0.48
Average weight per cubic foot—Pounds	29.91
Percentage of moisture, average	15.

ULTIMATE STRENGTH.

	Lbs. per Square Inch.
Tension, mean of 27 specimens	6,521
Compression, longitudinal, mean of 31 specimens	4,385
Compression across the fiber, reduction in height of piece of 3 per cent, 30 specimens	966
Reduction in height of 15 per cent, 30 specimens	1,197
Longitudinal shear (pieces clamped to prevent splitting, mean of 8 specimens	548

Following shows the result of experiments with beams of redwood supported at the two ends, loaded at the middle, broke by compression:

	Lbs.
Modulus of rupture, average of 9 specimens	4,955
Coefficient (modulus) of elasticity, mean of 8 specimens	797,467

The department of civil engineering of the University of Cal. has moved into more commodious quarters, and has equipped a laboratory with apparatus designed to test specimens of the various materials used in engineering construction. The list of apparatus includes a Universal testing machine of 200,000 pounds capacity (one of the largest in the United States, and the most powerful on the Pacific coast); a lathe for turning specimens of timber or metal; saws; a cement testing machine of 2000 pounds capacity; and many small tools used in preparing specimens, measuring, etc. It is proposed to add to these other machines with which to test road metal, building stone and other substances.

A long and thorough series of experiments upon the various timbers of the Pacific coast will be made, with the purpose in view of bringing forward prominently their good characteristics, and of obtaining complete and reliable scientific data concerning the best use of them in engineering.

All tests desired, which are in the nature of purely scientific experiment, will be made, free of charge, for engineers, architects and other persons engaged in construction, upon the delivery of the specimens required, at the civil engineering laboratory of the University, and an official report of the results of the tests will be promptly forwarded to the owners of the materials.

Tests of materials to be disposed of commercially will be made for companies or persons requesting them upon the payment of a small fee necessary to defray the expenses of the tests. The same rates will be charged as in the East.

All persons contributing timber, stone or the metals, according to the directions accompanying this bulletin, will, if desired, be put upon the mailing list of the laboratory, and will thereby receive the official reports of all experiments made by this department.

Residents of the Pacific coast, and particularly of the State of California, are cordially invited to co-operate in making these tests as extensive and thorough as possible. W. G. Curtis, assistant general manager of the S. P. R. R. has agreed to transport samples for tests to Berkeley.

Materials so contributed should be addressed: University of California, Department of Civil Engineering, Berkeley, Cal.

Different Forms of Commercial "Gas."

The gases commonly used to produce light, heat and power differ from each other both in the modes of producing them and in the proportions of their constituents. The old fashioned illuminating or coal gas is made by putting bituminous coal in a retort and heating the latter. The newer illuminating gas, commonly called water gas, is manufactured by passing steam through a mass of incandescent coke. This product is not only deficient in heating qualities, but is also unsuited to lighting until it has been enriched by the addition of selected gaseous compounds of carbon and hydrogen, of which acetyleue is the most valuable. For fuel, either in great industries or domestic service, by far the best gas is that which nature has distilled down in the earth's crust, and for explosion iu the cylinger of a gas engine the most economical article obtainable is made in very uearly the same way as water gas; but the process is continuous, instead of intermittent, and the stuff known as producer, or Siemens gas. Natural gas and the artificial product obtained with a retort for illuminating purposes abound in methane (or marsh gas) and free hydrogen. Water gas and producer gas, on the other hand, are deficient in these elements, but contain great quantities of carbon monoxide and nitrogen. Carbon monoxide is to some extent combustible, but not so valuable in this respect as methane and hydrogen; and nitrogen has no value whatever, merely diluting the compound and affording just so much extra matter to be heated and moved by its associates.

Mechanical Progress.

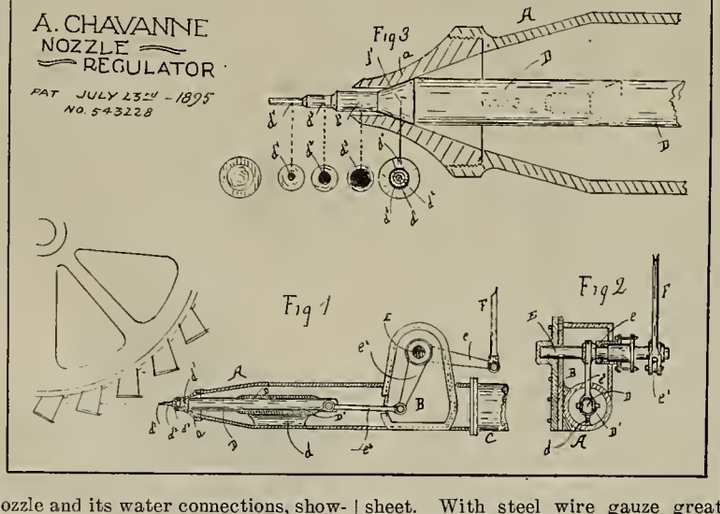
The Chavanne Regulator.

A. Chavanne, of Grass Valley, Cal., has recently patented an invention to provide the nozzles of water pipes discharging a stream of water under high pressure with a regulator.

Figure 1 is a sectional view of the nozzle and its water connections, showing the regulator, the manner of operation and also a section of a power wheel against which the stream of water is to be directed.

Figure 2 is a vertical section through the chamber or casing of the water connection at right angles to the section of the figure 1. *A* is a nozzle having the usual conical tip *a*. *B* is a casing or chamber in communication with the nozzle, *C* is the water connection from the source of water under head of pressure. Within the nozzle is fixed by an upright bracket *d*, a guide sleeve *D*, in which slides the plug *D*, which moves in the line of the axis of the nozzle. The forward end or head of the plug is made conical, or tapering, at *d*, and corresponds to the incliuation, or taper, of the interior of tip *a*, so that when pressed forward it will completely close said tip. Beyond this conical portion d^1, the head of the plug or valve extends, the extension is best made in a series of reduced diameters joining on another by inclined shoulders, represented by d^1, d^2, d^3, and varying in number as may be desired. Here are shown, for example, three. The plug *D*, which forms the regulator, is moved back and forth by the following means: Within the casing or chamber *B* is a shaft *E*, suitably mounted therein, and having one end exteuding outwardly through its side in a suitable stuffing box *e*, whereby through a crank e^1, connected to its end, the operating rod or connection *F* may be attached. Withiu the casing or chamber *B*, the shaft *E* has mounted upou it another crank arm, e^2, exteuding downwardly, within the casing, and having, attached to its lower end the connecting rod e^3 which joins it with the rear end of the slidable plug *D*.

By forcing the plug forward, so that its conical portiou d^1, fills the conical tip of the nozzle, the nozzle is closed, and the discharge of water cut off. By moving the plug back to its innermost limit, in which the smallest of its reduced diameters lies within the extremity of the tip (figure 3 dotted lines) the tip is open to its fullest extent and the largest amount of water will pass through the nozzle. By moving the plug to points intermediate of these limits, the amount of water discharged is varied correspondingly as shown in figure 3.



The inventor claims that with this regulator the stream at the outlet of the tip *a* emerges in a sinuous annular water tube, concentric with the head of the plug, without losing any of its impulsive power.

This new regulator is in present operation at the Independence mine, Grass Valley, Cal.

New Use for Steel Wire.

The incorporation of steel wire gauze with sheets of papier mache, or unprepared wood pulp, has made it possible to utilize paper advantageously as building material. Using the wire mesh as a body, the wood pulp is compressed on both sides of the same, to any desired thickness as well as size of sheet. With steel wire gauze great strength of the sheet is obtained from very little substance, and the buckling tendency of the paper fully counteracted by the rigidity of the wire. Experiments proved that a thickness of ⅛ of an inch of the material was sufficient for all roofing, an unsupported sheet of that thickness sustaining the weight of several men. Among other qualities is a system of thorough waterproofing and a method of fastening with steel bands, the simplicity of which is such as to enable any pressure upon the sheet to be borne by the whole of the fastening nails at once.

The material is said to be an effective non-conductor, and successfully resists heat, cold and wet. It also lends itself well to artistic treatment, both in variety of tint and association with timber work, this being attributed to the terra cotta like effects produced by the mixing of fine sand of various colors with the paint. — Northeast Lumberman.

Horseless Vehicles.

Carriages without horses have long been popular in France, where the best of roads have been built. Since 1892 they have been coming rapidly into favor through the invention of a petroleum motor. The recent race from Paris to Bordeaux was made with carriages of two or four seats. The motor is situated either at the back or front of the carriage. A lever is held by the driver for setting the carriage in motion and for steering. From two to five minutes suffice for starting time. The petroleum carriage moves backward or forward and at an average speed of eleven miles an hour. The petroleum is used as a fuel to produce steam. A novice may ride over 200 miles in two days of ten hours each.

Electrical carriages have thus far proved too cumbersome and expensive, the batteries alone costing $500; but they are clean, noiseless and require no skilled operator. Petroleum vehicles are light, more convenient in running and require no engineer. One of the best electrical wagons so far made in this country is by a Boston inventor, but weighs 5100 pounds. An electrical wagon in Philadelphia has run several hundred miles, but is clumsy with its 4250 pounds, of which the batteries weigh 1600 pounds, but give a maximum capacity of thirteen horse power. From 50 to 100 miles is made on one charge with a speed of fifteen miles an hour. Two residents of Kansas City have introduced an electrical wagon in Brooklyn, N. Y., weighing 3000 pounds, having 1800 pounds of storage batteries. At Lock Haven, Pa., a hotel runs an electrical bus with seats lengthwise and batteries under them. The batteries run the bus fifteen days of ten hours each. It carries 3000 pounds and weighs 1600 pounds.

U. S. Cousul Chancellor at Havre, France, has recently reported to the Department of State as follows: "French bicycles and tricycles are propelled by a small petroleum motor. The weight of the entire machine is considerably under 100 pounds and costs $250. The rider, after starting his motor, propels the machine with his feet unail the motor is working, after which he drops the treadles. On mounting a hill the rider can assist the speed by gearing the pedals again. Before this system can be profitably applied in the United States it will be necessary to bring our roads to the condition of European highways. In France all carriages pay an annual tax of from $9.50 to $13.50, according to their seating capacity. Bicycles pay $1.93, and no vehicle is allowed on the road until the tax is paid."

At Springfield, Mass., a company has been formed to manufacture a horseless gasoline carriage for light riding purposes, and it is expected the first three of its carriages will be eutered in the November horseless carriage race at Chicago.

A. Schilling & Co. of this city make a gas engine tricycle which has attracted considerable attention. The engine is 2 H. P.; the tricycle will carry three persons over grades and roadways of varying conditions and attains a speed of teu miles per hour on frvorable ground.

Electrical Progress.

Electricity for Logging.

N. E. Britt of the Oregon & California Railroad land department, Portland, Or., says: The unaccessibleness of the timber in the Pacific Northwest is much more imaginary than real. It is a sort of bugbear that frightens a great number of lumbermen who would become investors. Now, I do not hesitate to say that the great bulk of the timber in the Northwest can be got out cheaper than logging is carried on in the Wisconsin and Michigan forests. And the conformation of the country is what will produce this very result. Study for a moment. Here we are running many scores of street cars by power conveyed for miles through a single wire from Oregon City. There is not a township of timber land in Oregon that cannot furnish enough water power from one to a dozen or more streams flowing through it to handle nearly every stick of timber on it. I have been all through the timber regions, and have a pretty definite idea of the subject. Railroads can be built everywhere along the grades afforded by the larger streams, and by these means the electric power conveyed, as I have suggested, by wire from a dynamo and wheel at the nearest practicable water course. There is no place where this would be more than four or five miles distant. It would be an extremely simple matter. Your poles are already standing. Connect your power with windlass and cable and then you are ready to yank the logs out of the hardest places, with little or no outlay for skid roads, no injury to cattle and a good deal of money saved by the rapid handliug. They are using donkey engines, with a windlass and a cable 300 feet or more in length in many places now, and the logs are being handled cheaply and expeditiously.

There are patches of timber like the big Mohawk tract of 65,000 acres in Linn county, where there are billions of feet of the finest timber in the world, with scores of streams draining it, and affording a dozen times as much power as will be required to get every log out of it. Of course, it is admitted by every Eastern lumberman that our timber has no equal, and when they come to give the subject something more than superficial attention they will acknowledge that logging will continue to be cheaper here than iu Wisconsin or Michigan.

Very Probable.

The current number of the *Engineering Magazine* has an article by P. B. Delany on the future of the electric telegraph and the possibilities of mechanical transmissiou, in which it is asserted that the final destiny of the telegraph is to carry all correspondence of any urgency. The system will be onc haviug no electro-magnets, no armatures or movable parts, but will be based upon electrolysis. It will be the chemical plan of recording messages. Recent improvements have been made in the perforating machine, transmitter and receiving instrument for automatic chemical telegraphy. The letter of the future will be dictated to a stenographer, who, instead of typewritiug it, will perforate it on a paper tape. This tape will be sent to the telegraph office, where it will be put through the automatic transmitting machine, and in a second or two it will be at its destinatiou. The receiving tape will be delivered direct, and the plain Morse characters will be translated on the typewriting machiue hy the correspondent's stenographer. Between New York and Philadelphia, over a copper wire weighing 300 pounds to the mile, 3000 words per minute can be recorded perfectly, and, with a copper wire weighing 850 pounds to the mile, 1000 words per miuute cau be carried from New York to Chicago. Reduced to dollars and cents, it is estimated that fifty words, about the average of a business letter, can be transmitted 1000 miles in three seconds for 15 cents. This is a matter of special interest to the Pacific coast, where magnificent distances prevail. When telegraph tolls cease to be a burden, business will be enlarged—more can be done during the day—when the time of communicating with commercial centers in other parts of the country will be reduced from days to seconds.

Electric locomotive No. 1, used in hauling freight trains through the Belt Line tunnel of the Baltimore and Ohio Railroad, has again demonstrated that its drawing power far exceeds the expectations of its builders. Forty-four loaded freight cars and the three steam locomotives, not working, which had been used to haul the heavy train on the surface, were coupled to the electric giant at the tuunel entrance one day last week and pulled up the heavy grade of the tunnel, a speed of twelve miles an hour being developed. The total weight of the train was 1900 tons. The draw-bar pull exerted in starting this unusually heavy load was more than 60,000 pouuds, and continued through the trip at more than 40,000 pounds. The officials claim that no steam locomotive has ever approached this record.

There are two methods of electrically lighting railway trains by means of storage batteries. One is to have duplicate batteries so that one may be charged while the second is in service. The other is that system in which a small dynamo is belted or geared to one of the axles. When the car moves, the motion of the axle is communicated to the armature of the dyuamo, and the current that is thus generated is used to charge the battery. In this case the battery acts as a reservoir, giviug steadiness to the light and making the illumination continuous and uniform in spite of the variations in speed and stoppages of the train. Under this system it is possible to get along with a single set of batteries for each car.

Practical Information.

Active Aleutian Volcanoes.

The reveuue cutter Commodore Perry returued from the uorth last week, where she has been confronted every night for weeks by a gigantic line of fire. As Captain Smith expresses it: "The devil's stokers have been stirring up the subterranean sea of flames that is supposed to lie thousands of feet under the Bering's bed, and as a consequence fully twenty of the forty volcauoes in the Aleutian chaiu are uow active."

The line of islands lying between the Beriug sea and the Pacific ocean beloug to the United States, and on them are probably the only active volcanoes lying within American territory. Much has been written of Bogoslav island, which has been throwing up a cloud of steam at times for years, but it was supposed that all the other peaks on this singular line of islands were extinct craters only.

Now, as far as the eye can reach from auy point in the Bering sea, adjacent or even at a distauce from the famous seal islands, the rising smoke and steam can be seen in both directions. The eruption is gcueral, and so very lively that at uight the airy columns take on the reflections of the craters. Nowhere else on the globe can such a sight be witnessed.

In the daytime only the white smoke or steam is visible. As dusk comes and darkness follows the wouder grows. The brighter columns show up in the cold Alaska night first, and as it gets darker other vivid curls of smoke are to be seen at greater distance. Sometimes when the position of the observer is advantageous a dozen or fiftcen of these modern pillars of fire are in sight.

The show of subterraneau force is the most uoteworthy ever observed on American soil. As proof of the mighty power that is at work beneath the islands, a neck of land has been forced up out of the sea between Bogoslav and old Bogoslav, and the two islands are now one. It is a queer looking land. The rocks in this neck are manifestly of volcanic origin, black and smooth in surface as if once melted.

The *Railway Age* says that about six tons of steel rails are annually required for renewals per mile of road, which on the present mileage of the country would represent about 1,080,000 tons. "Adding to this estimate," says the *Age*, "which is probably within bounds—notwithstanding the increasing life gained from iucreased weight—the requirements for some thousands of miles of new construction yearly, the low average of one hundred tons to the mile, it is evideut that the rail mills will continue to find occupation."

To get a practical fluid with which to write on glass dissolve 36 grammes of sodium fluoride and 7 grammes of potassium sulphate in 500 grammes of water. In a separate vessel 14 grammes of zinc chloride are to be dissolved in 500 grammes of water, and 65 grammes of hydrochloric acid are to be added to the solution. Immediately before using equal parts of the two solutions are to be mixed and applied to the glass, either with a pen or a peneil.

Manganese is reported abundant in the French Congo, being met with under three different circumstances, in the copper mines, in the laterite, in the form of *acerdes*, constituting a coat, and sometimes a seam, underlying the ferruginous strata, and also in the bed of the Kanda torrent, where large blocks of conglomerate were fouud, enclosing quartz pebbles surrounded by ferruginous cement containing $Fe^2 O^3$ 21 and $Mn^2 O^3$ 70.5 per cent.

The metric system of weights and measures is to be obligatory in Mexico from September 16th, 1896. This system has been used in the government departments of Mexico for some time past, but a decree recently passed makes it the sole system throughout the republic, and will make an end of the various old Spauish measures hitherto in vogue in ordinary business transactions.

F. A. HUNTINGTON'S NEW IMPROVED
Centrifugal Roller Quartz Mill.

This Improved Mill has the following advantages over my Geared Mills, viz:
1st.—I dispense with the wooden frame with posts and set the mill on heavy timbers or a concrete foundation, thereby securing a solidity that cannot be attained when set on posts.
2d.—I dispense with gearing and drive direct from the pulley.
3d.—There are five less places to oil.
4th.—The Mill is built much heavier and stronger than the former ones.
5th.—Being heavier and set on a solid foundation, it can be run much faster, thereby increasing its crushing capacity in the same proportion as centrifugal force is increased by increased velocity.
Manufactured by F. A. HUNTINGTON,
143 First Street, San Francisco, Cal.

GATES ROCK AND ORE BREAKER

PRODUCES A MORE PERFECT CUBIFORM MATERIAL AND A GREATER QUANTITY IN A GIVEN TIME PER HORSE POWER USED THAN ANY OTHER CRUSHER ON EARTH.
CAPACITIES UP TO 150 TONS PER HOUR. NINE DIFFERENT SIZES.

A REVOLUTION IN ORE PULVERIZING.

THE

Merralls Hydraulic Quartz Mill,

The Greatest Ore and Rock Pulverizer in the World, Either Wet or Dry.

THE ONLY MILL BUILT THAT RIVALS STAMPS. Our six-foot mill (No. 1) will reduce more ore or rock to pulp than a ten-stamp mill, with less than one-half the power and less than one-half the wear and tear, besides saving a much larger per cent of the gold in the ore.

This mill will reduce from 25 to 500 per cent more ore than any other rotary mill in use. Cheap, simple and economical. Four sizes built—from 15 to 250 tons capacity.

Send for Circular. Address

MERRALLS MILL COMPANY,

45 & 47 Fremont Street ..... San Francisco, Cal.

DEWEY & CO., Patent Solicitors, 220 Market St., San Francisco.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1895.
THE MCGLEW CONCENTRATOR COMPANY: I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 91½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 24. 1895.

Silver did not hold up its last week's prices, though as to the future some very promising statements are made. A New York dispatch says: The best authorities on silver look for a steadily improving demand for the metal for some time to come. The willingness of Japan to accept the indemnity from China in silver contributed laregly to the improvement in its price which has been noted during the last few months, and the accumulation of the metal in London will go on in order to complete the installments of the indemnity at various dates of payment.

Both China and Japan are showing increased inquiry for silver, as the large amounts of the metal distributed by both countries in payment for war material and supplies have been diverted to India and other silver countries.

Mr. Townsend of Hongkong states that silver ordered two months ago has only just been delivered. The silver smelters are said to be sold ahead for two months.

A Washingtou dispatch says: All silver coinage except that of suhsidiary silver has been ordered suspended after November 1 by Secretary Carlisle. In carrying out this policy the New Orleans mint will be practically closed and dismautled after that date.

Secretary Carlisle has for some time heen considering the advisability of stopping all silver coinage except that of suhsidiary coins. Since he has heen head of the Treasury Department only 4,382,224 standard silver dollars have been minted. Since July 1 last only ninety standard silver dollars have heen coined. The total coinage of silver under all acts amounts to $423,289,307.

The treasury now holds 137,644,000 fine ounces of silver bullion purchased under the Sherman act, the cost of which was $124,080, 323, with a coining value in silver dollars of $177,964,000. If this hullion were coined into silver dollars the profit to the Government on its coinage would be nearly $54,000,000, which sum could he paid out for the ordinary expenses of the Government or against which silver certificates could he issued.

The principal effect of the action taken by Secretary Carlisle is to convert all the silver hullion held hy the Government into gold obligations under the parity clause of the Sherman act.

Secretary Windom, in 1891, construed the law to mean that all the Sherman notes issued against hullion were redeemable in gold. This construction of the law was concurred in hy his successors, Secretary Foster and Carlisle, and has been in practical operation during the past four years. Under it $76,193,522 has been redeemed.

The coinage of silver hullion into standard silver dollars operates to prevent Sherman notes heing issued, and silver certificates issued against the standard silver dollars are redeemahle only in silver. Thus, from the same base (silver hullion), the Sherman notes become gold ohligations, and silver, coined into standard silver dollars, and silver certificates, issued upon them, become silver ohligations.

The suspension of the coinage of standard silver dollars therefore leaves the silver hullion free from any other liahility of conversion into silver obligations. The closing up of the New Orleans mint leaves only the United States mints at Philadelphia and San Francisco in operation. At these miuts only gold and suhsidiary silver will hereafter be coined, unless Congress should direct to the contrary and its action he approved hy the President.

Mining Share Market.

SAN FRANCISCO, October 24, 1895.

The market has shown more strength the past week, with an advancing tendency toward the close. It is reported that several outside operators—hrokers and dealers—have pooled their interests, so as to promote a small-sized deal along the entire liue. So far as can he seen, what are known as insiders are not in the market. While this seems to be the case, yet the impression prevails that they are watching with considerable interest the work now under way in several of the mines on the Comstock, and if they feel justified hy a good showing in two or more, then they will come into the market. Large-sized deals cannot now be made on talk, points and write-ups: it takes a good-sized ore development which can be backed hy twenty prices.

Following the announcement that John W. Mackay Jr. had heen thrown from a horse and killed, many timid holders hegan to let go. This selling feeling was encouraged hy the manipulators through cross orders and hear reports, sedulously circulated hy cappers and those used hy the latter. After the street ceased selling, then signs began to he seen that the movement had set in for better figures, so as to unload hefore the long line of assessments are levied. Several companies are carrying their indehtedness, evidently fearing to levy an assessment, for assessments must he collected and this cannot be done when the market has been greatly depressed and the hulls terribly punished through steadily depreciating values. The opinion prevails that the outside pool has been saddled with a large quantity of shares, and it does not pay to hold them, with assessments staring them in the face. To unload, a small-sized deal must he promoted.

The news from the mines grows in interest. While there is much to create a feeling of encouragement that in several mines a sufficient quantity of paying ore will be found to inspire a hull feeling with the more credulous street and chronic traders, yet the more experienced, shrewd and heretofore successful dealers are justly fearful that the results may prove temporary. Feeling this, they think that any hull movement at this time will he followed hy disastrous results to those who have been for years laboring under the pleasing hallucination that there are millions in it. In tbe Alta group Alta is in very interesting ground, with seemingly good prospects ahead. In Overman the work is still heing doue in a half-hearted way, as if the management feared that there is a ghost ahead and did not wish to discover it as yet. In Belcher, Seg. Belcher and Crown Point the work is in the right direction. Kentuck continues to prosecute work, which eats up the surplus money, hut which is not expected to yield up anything more than an assessment. In Confidence and Challenge the work grows in interest. If the expectations of the hetter informed are realized it ought not to create surprise if good news should come to hand at any time. The north lateral drift, noted last week, is said to he in Cballenge ground. It is reported on the street that the intention is not to crosscut the lode until connection is made with the Cou. Imperial west drift. In Confidence the west drift run from the surface tunnel level is, hy private advices, said to he in ore; hut private advices are not always safe to follow. The work in Yellow Jacket is essentially unchanged. Both Con. Imperial and Alpha's west drifts are being lazily pushed ahead. Even at the progress being made, they ought to strike the west lode either the latter part of next month or else the fore part of December. In the middle group of mines the work is about of the same character as that heretofore made puhlic, viz., stringers, streaks and narrow lodes are heing followed with the hopes of good results. In prosecuting the work ore is extracted. The work in Gould & Curry and Best & Belcher is unchanged since last reports. In Con. Virginia active and energetic work is heing done on several levels. At the annual meeting the superintendent's report for the fiscal year ending October, 1895, was as follows: Worked at the Morgan mill, Carson river, Nev., 10,255 tons and 50 lbs. of ore; value per railroad car sample, $57.56 per ton, 83 30-100 per cent of assay value; value per battery sample, $55.10 per ton, 87 02-100 per cent of assay value; hullion yield, $250,-730.33 gold, $241,077.31 silver; total, $491,-807.64; hullion from granulations, slag and sweepings, $1096.10, shipped to San Francisco; assay in gold, $24.94; silver, $30.15; total, $55.10 hattery; yield in gold, $24.44; silver, $23.50; total, $47.95 yield.

This is a very gratifying and encouraging report, for it shows that the ore was well handled in the interests of shareholders. The work in Ophir, Mexican, Union and Sierra Nevada is heing closely watched by miners. It is stated that there is a prospect that West Con. Virginia will secure from Con. Virginia the use of the old shaft so as to have a diamond drill run to the west for the west lode.

From the outside mines, Bodie and others, the news is unimportant. Work on the Brunswick lode seems to he pushed with more energy.

The lowest and highest prices paid on regular call from Oct. 17 to Oct. 24, inclusive, were as follows:

Mines.	Lowest.	Highest.
Alta	$ 16	$ 18

And in accordance with law and an order of the Board of Directors, made on the 5th day of July, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 12, Rotunda Mills Building, San Francisco, California, on WEDNESDAY, the 4th day of September, 1895, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on September 4th, 1895, the above sale is postponed to FRIDAY, the 4th day of October, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, Cal.

POSTPONEMENT.

By order of the Board of Directors at the regular monthly meeting held at the office of the company on October 3d, 1895, the above sale is postponed to SATURDAY, the 2d day of November, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

DELINQUENT SALE NOTICE.

SONORA EXTENDED MINING CORPORATION.–Location of principal place of business, San Francisco, California. Location of works, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 25d day of August, 1895, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order from the Board of Directors, made on the 25d day of August, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, No. 213 Jackson street, San Francisco, California, on MONDAY, the 28th day of October, 1895, at the hour of 3 o clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

C. A. STRATTON, Secretary.

Office, 213 Jackson Street, San Francisco, California.

Notice of Assessment.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6r t (1st) day of October, 1895, an assessment (No. 20) of Ten (10c) cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 63, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fourth (4th) day of November, 1895, will be delinquent and advertised for sale at public auction, and unless payment is made before will be sold on MONDAY, the twenty-fifth (25th) day of November, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 63, Nevada block, No. 309 Montgomery street, San Francisco, California.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXXI. Number 18. SAN FRANCISCO, SATURDAY, NOVEMBER 2, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Prominent Home Industry.

The mineral wealth of our State comprises great non-metallic resources but partially developed. This journal has devoted considerable space to notices of the slate, granite, marble, onyx, travertine, and other building material which abound within the confines of the commonwealth, and this week gives place to brief reference to a prominent home industry.

In the city and county of San Francisco is a rock quarry which produces building stone of excellent quality, owned and operated by Gray Brothers. It is metamorphized sand stone, weighs 178 pounds to the cubic foot, being 10 pounds heavier than granite, and stands a great compression strain.

The following is an analysis of this blue silicate of quartz, recently made by Thomas Price & Son, from a sample from the quarry, corner Green and Sansome streets:

	Per cent.
Silica in the form of quartzy material, with a small quantity of mica	87.15
Oxide of iron, with a little sulphide of iron	2.35
Alumina	4.10
Water and carbonic acid	1.60
Undetermined (composed of lime, magnesia and alkalies)	4.80

FIG. 1 — WEST FOUNDATION WALL OF NEW FERRY DEPOT.

There is another quarry of the same rock at 26th and Douglass streets. The value of this rock for building purposes is beginning to be understood. On page 285 is illustrated the office building of the Golden Gate Park Commissioners, now in process of completion, the first building in San Francisco constructed with stone from within the city limits.

Our city is largely built of wood, but it is probable that the value and utility of stone will be given recognition commensurate with its merits. The Parrott building, on Market street, opposite the Baldwin Hotel, the finest edifice in San Francisco, shows what possibilities lie in that direction.

Crushed stone for road building, broken rock for macadam, concrete work for foundations, and artificial stone sidewalks are also furnished in large quantities by the Gray Bros., who employ over 500 men in this city and Los Angeles. Figs. 1 and 2 illustrate the character of the concrete foundations furnished for the new ferry depot at the foot of Market street, this city, which is now in course of construction.

FIG. 2 — FOUNDATIONS FOR NEW FERRY DEPOT.

The stone industry is an important one in this country. The quarry value of the stone produced in 1894 was $37,377,816. Not all this, of course, went into buildings. Of the granite $2,254,587 was for paving, of the slate $489,186 was other than roofing, and of the limestone $520,842 was used for flux. In all $3,294,615 of the quarry output and an undetermined part of the limestone, which was used in road-making, was employed outside of building in 1894, which was a poor year. The aggregate in 1894 was three-quarters of the amount in 1892, $48,706,625; 1890 had an output of $47,000,000, and 1889 of $42,807,706. In 1880 the aggregate was $18,356,055, so that 1894, a poor year, doubled 1880, a good year fifteen years earlier. No statistics of this industry are collected for foreign countries, but its amount here is probably larger than that of all continental Europe put together. This is known to be true of our aggregate mining product, metallic and non-metallic.

In '94 Pennsylvania's total was $5,245,507: the largest product of any one State. Ohio is next with $3,510,511, and Vermont third with a product of $3,461,332. About half the granite comes from New England, half the sandstone from Ohio, half the marble from Vermont, and Illinois and Pennsylvania together furnish a third of the limestone. The value of the yield of this State was very small in proportion to the extent of the commonwealth and the great diversity of its non-metallic mineral resources.

ALL railroad records for speed were broken on the 24th ult., by a train on the Lake Shore and Michigan Southern railroad, which ran from Chicago to Buffalo, 510.1 miles, in 481 minutes 7 seconds, an average of 63.3 miles per hour. This time included stops. Exclusive of stops the run was made in 470 minutes 10 seconds, an average speed of 64.98 miles per hour. The New York Central's record of September 11th was an average speed of 63.61 miles an hour, including stops, and 64.26 miles an hour, exclusive of delay. The east coast record on the Great Northern road of England from King's Cross to Aberdeen is 523 miles in 512 minutes, or 60.3 miles per hour. The west coast record on the London and Northwestern is 540 miles in 512 minutes, or 63.20 miles per hour. The record-breaking train from Chicago to Buffalo went on to New York City over the New York Central, and made a new record between New York and Chicago, the entire distance of 980 miles being made in 17 hours 45 minutes and 23 seconds. Chicago men on board had in their pockets that morning's papers. This was the first time that a regular edition of a Chicago morning paper had been read in New York City on the day of its publication. The train was made up of three coaches, engine and tender. The coaches weighed 304,500 pounds. The weight of the engine and tender was 184,000 pounds, making the total weight of the train 488,500 pounds.

TABLE OF CONTENTS.

ILLUSTRATIONS.—West Foundation Wall of the New Ferry Depot; Foundations for the New Ferry Depot, 281. Office Building of Golden Gate Park Commissioners, 285.

EDITORIALS.—A Prominent Home Industry; Railroad Records Broken, 281. The Northwest Mining Association; The Rawhide Mine on the Boston Stock Exchange; Sulphur From Italy; South African Gold Fields of Commercial Importance to this Coast; Ability of Electricity to Succeed Steam as a Transportation Motor; Speculation in South African Mining Shares; The Survey of the Thirty-ninth Parallel of North Latitude; Anti-Debris Zeal of Some of the Valley Papers; Arizona, Idaho and Montana Mining Laws; Some Questions Answered, 282.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 286–87.

SCIENTIFIC PROGRESS.—A Great Work Accomplished, 288.

MECHANICAL PROGRESS.—Thirty Knots an Hour; Copper Strong as Steel; Acids in Lubricating Oils; Gas Pipes Made of Paper, 288.

ELECTRICAL PROGRESS.—The Electric Wheel, 288. The Inverted Arc Lamp; Electricity to Displace Steam; Apparatus to Bleach Cotton Cloth by Electricity; A Talk Meter Wanted; Fine Aluminum Wire and Electric Current; Electric Current for Lighting and Power at Seattle; Nevada City Electric Power Co., 289.

PRACTICAL INFORMATION.—Overathleticism; Wages Paid at the Chicago Drainage Canal; Future Inland Waterways; Comparative Value of Foods; Mexican Logging and Lumbering, 289.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 294.

MISCELLANEOUS.—Concentrates, 283. The Sampling and Measurement of Ore Bodies in Mine Examinations, 284. Reasonable Geology; Electric Power for Long Distance Transmission; Recent Additions to Museum of California State Mining Bureau, 285. Coast Industrial Notes; Personal; Books Received, 287. Notices of Recent Patents, 295.

AT a meeting in Spokane, Wash., last week the Northwest Mining Association, resolved: "That we fully and heartily endorse the action of the California Miners' Association held in San Francisco, commencing on the 14th inst., and congratulate them on the good work they have done."

SOMETHING new in the mining world is furnished by the listing on the Boston Stock Exchange of the stock of the newly incorporated Rawhide Mining Co. of West Virginia. The Rawhide mine in Tuolumne Co., this State, is a dividend-paying concern, and the listing of a dividend-paying California gold mine in any American city is so unusual an event as to attract notice.

THE fact that this country pays an annual tribute to Italy of $2,000,000 for sulphur has attracted the attention of Ohio men to the sulphur deposits of Louisiana, which are considered susceptible of great development. In this connection it is worthy of note that the sulphur beds of Lower California furnish a fine product and can doubtless be developed into a paying coast industry.

THE South African gold fields are of commercial importance to California and the coast. They furnish a market for California mining machinery, Oregon lumber, and have so far given employment to over one hundred skilled California mining men at annual salaries ranging from $2500 to $60,000. The predicted crash in South African mining stocks will have no more relation to the prosecution of gold mining than the bursting of similar bubbles on this coast had on the actual business of mining.

CONSIDERABLE is asserted regarding the ability of electricity to succeed steam as a transportation motor; but when, as was demonstrated last week, one can leave Chicago and be in New York in time to witness the close of a theatrical performance in that city on the evening of the same day, it must be conceded that the steam locomotive is not likely to become obsolete. An engine and train in a most remarkable run on the 24th of last month, on the Lake Shore and Michigan Southern Railway, between Chicago and Buffalo ran one mile at the rate of 92.3 miles per hour. These statements sound incredible, but the facts as stated here and on the first page of this issue are precise and authentic.

WERE the cases to be paralleled, and an era of speculation in gold mine stocks started here, equal in extent to that in London and Paris, the facts, so far as California is concerned, would justify even greater exploitations here than those now going on in what is styled "the Kaffir Circus." It is a fact worthy of prominence that the few dividend-paying gold properties in South Africa to-day are exceeded in that capacity by California gold mines. Were South Africa to possess a Utica, Kennedy or Rawhide profit producer, the law of proportion suggests that the British manipulators of South African mining snares could absorb two billion dollars as easily as they have absorbed one billion in disposing of stock.

ELSEWHERE in this issue brief notice is accorded the greatest contribution to science ever given by a government—the survey of the thirty-ninth parallel of north latitute, just completed. The commercial idea was secondary. The prime object was to accurately and precisely determine the figure of the earth. North and south lines had largely contributed to this final result, but for absolute exactness in astronomical calculations an east and west line of the farthest possible extent had to be run. The Thirty-ninth parallel from Point Arenas to Cape May, New Jersey, was chosen as the stretch of territory best adapted for the work, and the United States government has now finished the longest line ever surveyed in this world, or probably any other. The earth is, in general, an oblate spheroid; its exact shape is figured on the theory that the globe was once a molten mass; the number of its diurnal revolutions and its centrifugal force form the factors of computation, but exact data rendered an extensive triangulated survey necessary where accuracy of outline was desired. To the coast and geodetic survey is due great praise for the successful completion of the work.

THE anti-debris zeal of some of the valley papers leads them to say many things that have no foundation in fact. Like the Sacramento *Record-Union*, they iterate and reiterate till they themselves believe the fanciful creations of their disordered imaginations. To seriously notice such regular emission of misstatements would be to accord a substantial existence that such airy vagaries lack. A sample statement may be noticed wherein the Marysville *Appeal* editorially asserts that hydraulic debris has filled the channel of the straits of Carquinez six and one-half feet, and because of that that Major Heuer has called upon the government to dredge the channel to enable its ships to visit the navy yard for repairs. In answer the Vallejo *Chronicle* says: "You are saying something that is not so. The channel between Vallejo and Mare Island from Carquinez straits to some distance above the navy yard is as deep as it ever has been. It is not so wide, perhaps, for the reasons that the deposits carried into the Napa river by the heavy rains in winter find lodgment on the banks, and it is the mud that has accumulated inshore in this way that is now being dredged out. Dredging is a common thing at all navy yards, but it cannot be said that hydraulic slickens is filling up the rivers and bays on which Eastern navy yards are located."

ARIZONA, Montana and Idaho have recently passed mining laws that make many important changes in the required modes of procedure. The Arizona act has been given considerable notice in these columns. As becomes a territorial ward of the nation, Arizona has not attempted to override the federal statutes. With much that is good in the recent Montana and Idaho mining legislation, is mingled some provisions that may conflict with United States statutes. It is evident that till courts of final resort decide on some points, the business of mining lawyers will be augmented in both States. Among the good requirements of both the Montana and Idaho new legislation is that at least 100 cubic feet of work development be done on a lode claim sixty days after location in Idaho, ninety days in Montana. In both States an affidavit of the annual assessment work is called for, the Montana act saying such affidavit "may" be filed, the Idaho law specifying that it "must" be filed. In general, the Montana legislators seem to have been more ambitious, with the ambiguity so often an accompaniment; the Idaho legislators evidently meant to leave little to litigation, and to make matters as unpleasant as possible for the individual who will neither work his claim nor give it up, but who hangs on with the merest shadow of a possessory title, to the detriment of the region he infests.

Several Questions Answered.

As the year draws to a close and stormy weather begins, letters of inquiry regarding assessment work are more frequent from tardy owners of claims who have not yet done their assessment work. Several can be answered by the statement so often found necessary to repeat in these columns, that the regular annual assessment work on each unpatented claim required by law must be done for the current year by January 1st, '96. The suspension applied only to '93 and '94, but does not apply to '95. If the requisite $100 of work or improvements is not done by the 1st of next January, the claim is subject to relocation.

Another set of inquiries relate to a matter that was discussed considerably a year ago, and now comes up again, viz., the recording of the notice of intention to hold or work the claim. If the correspondence received at this office be any criterion, it would seem that the result of failure to comply with the provisions of the suspension act may be troublesome to many.

The easiest way to answer this latter class of questions is to republish the act passed in July '94, which is precisely similar to the one enacted in November '93. Following is the official text of the bill as furnished us at the time by Senator Perkins and Congressman Caminetti:

An act to amend section numbered twenty-three hundred and twenty-four of the Revised Statutes of the United States relating to mining claims.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the provisions of section numbered twenty-three hundred and twenty-four of the Revised Statutes of the United States, which require that on each claim located after the tenth day of May, eighteen hundred and seventy-two, and until patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year, be suspended for the year eighteen hundred and ninety-four, so that no mining claim which has been regularly located and recorded as required by the local laws and mining regulations shall be subject to forfeiture for non-performance of the annual assessment for the year eighteen hundred and ninety-four: *Provided*, That the claimant or claimants of any mining location, in order to secure the benefits of this act, shall cause to be recorded in the office where the location notice or certificate is filed on or before December thirty-first, eighteen hundred and ninety-four, a notice that he or they in good faith intend to hold and work said claim: *Provided, however*, That the provisions of this act shall not apply to the State of South Dakota.

SEC. 2. That this act shall take effect from and after its passage.

Approved July 18, 1894.

It will be seen that a necessary part of the performance was the proper recording between July 18 and December 31, '94, by the claimant or claimants of intention to hold and work the claim.

This journal repeatedly directed attention to the importance of the clause referred to, and on December 15, '94, editorially said:

"The attention of those who have not yet secured the benefit of the suspension act for '94 is directed to the fact that only about two weeks remain, and that by the 31st of this month the claimant or claimants of any mining location, in order to secure the benefits of this act, shall cause to be recorded in the office where the location notice or certificate is filed a notice that he or they intend to hold and work said claim. By so doing they will be exempt from being required to do $100 worth of labor or improvements for the year.

"In answer to several inquiries received during the week it is to be noted that the notice must be *recorded*. It will not do to simply "file" it. In some of the counties of this State the clerk or recorder good naturedly makes no charge, and that is in direct line with the idea of the exemption, but if he demands his regular fee it must be paid. It is not necessary to have it acknowledged before a notary."

In answer to the third set of inquiries regarding the entry of land for gravel pits and reservoir purposes, and granting right of way for pipe lines, it is stated that a bill passed both houses of Congress last December, authorizing such entry and granting such right of way. Under this law any citizen of the United States, or ditch company, or water company, may buy lands for reservoir purposes not to exceed 160 acres of unoccupied land, at a price not less than $2 per acre. When the purchased lands are in a mining district they are not to be considered mineral lands, but the patents do not authorize the purchasers to extract mineral therefrom, reserving that right to the Government. Non-use of the land so purchased for two years constitutes forfeiture.

Concentrates.

THE *Tidings* itemizes over $125,000 in buildlng improvements in Grass Valley in '95.

IN the Witwatersrand, South Africa, district there are at present 3835 stamps at work.

A WARDNER, IDAHO, subscriber asks: "What is the deepest drill hole ever put down?"

THE owners of the App mine, Amador Co., intend to add forty stamps to their present mill.

THE *Free Press* declares that Shasta county mines will employ 20,000 men in less than five years.

THE Illinois Mining Co. has fifteen men at work in their mines at Placeritas, near Prescott, Ariz.

SPOKANE OWNERS have paid Eastern stockholders in the Josie Mining Co. $37,500 for their interests.

THE Blossom mill, near Ogilby, Cal., is reported turning out from $8000 to $10,000 per month with ten stamps.

COMPLETION of the line to Mariposa gives telephonic communication to that town via Stockton and Merced.

UNDER the new Utah State constitution all patented mining claims will be assessed at the rate of $5 per acre.

ACCORDING to the annual report of the Director of the Mint, the ratio of gold to silver during the year was 32.56.

A 60-STAMP mill is to be built at the Jenny Lind mine, in which Supt. T. T. Lane of the Utica is largely interested.

FIVE carloads of ore from the Trail Creek mines passed through Seattle one day last week for the Tacoma smelter.

THE War Eagle mine at Rossland, B. C., will increase its force to 200 men as soon as the new machinery is in operation.

MR. WRIGHT has bought for $60,000 the Black Oak mine, Tuolumne Co., and will work twelve men on eight-hour shifts.

AT Maybert, Nevada county, the Fountain Head Gold Gravel Mining Co. has incorporated to work the company's claims there.

IT is estimated that the silver output of Utah for the current year will reach 8,000,000 ounces, as against 6,500,000 ounces in '94.

THE average expense of working the largest and best conducted of the Witwatersrand, South Africa, mines is represented to be 70 per cent of the output.

MONTANA PAPERS say John S. Miller of Helena has sold the Diamond mine at St. Louis near Townsend for $3,000,000. The report is unconfirmed.

THE exportation of ores from the State of Sonora, Mexico, via Nogales, for the months of July, August and September, aggregated 1,274,000 pounds.

THE Los Angeles Petroleum, Smelting and Mining Company has incorporated for the purpose of carrying on a general mining and smelting business.

FURNACEVILLE, one of the old pioneer camps of Shasta county, is again coming to the front and will doubtless be favorably heard from before long.

J. B. HOLMES has secured sufficient money to pay off the indebtedness of the Cerbat Company and will immediately start up work on the mine and mill.

ABOUT 85 per cent of the money invested in Cripple Creek, Colorado, mines is Denver capital, the remainder from California, Massachusetts and New York.

THE Montana *Miner* says the resumption of work by the Great Falls smelters means employment for 120 men in the mines and a payroll of $20,000 a month.

THE St. Mary's Mining Company has incorporated in Spokane, Wash.; capital, $500,000. The claim is in Trail Creek district, B. C., and adjoins the Ottawa.

A NEW 20-stamp mill is in process of erection at the Denver mine, Forbestown, Butte Co. A similar sized mill is to be put up at the Carlisle mine, near Enterprise.

THE Jacksonville *Times* says that Geo. Wait, who is mining on the middle fork of the Applegate, in Jackson Co., Oregon, is taking out gold that goes over $19 to the ounce.

FOR the first time in fifteen years the Peck mine, Arizona, is unwatered, and the present proprietor, A. Falso, now expects to keep that old bullion producer up to its old time record.

THE Union Gold Mining Company has incorporated in this city; G. R. Fletcher, W. B. Hamilton, R. Harold, Jr., and M. J. Green, incorporators; capital stock, $2,000,000, fully subscribed.

ONE year ago the Yellow Jacket, Lemhi, Idaho, had ten stamps in operation: now there are forty dropping and twenty more will be added this winter. S. R. Thompson is superintendent.

THE exaggerated reports of great mining activity in Globe, Ariz., appear to have traveled on the wind, and as a consequence miners are flocking there from all quarters, from Oklahoma to the Pacific.

THE Victor Mines and Land Co. of Victor, Cripple Creek district, Colorado, paid its sixth monthly dividend on the 21st ult., the amount being one-half cent per share, or $3000, making $18,000 paid to date.

ARIZONA papers say the hills are full of miners doing assessment work. The new Arizona law is getting in its work, and the chances are that more assessment work will be done this year than for many years past.

ELEVEN MEN with a three-stamp mill and supplies have gone from Redding to Harrison Gulch, in the southwestern part of Shasta county, to work a newly discovered ledge. W. R. Conant of Castella has charge of the enterprise.

THE Fool's Gulch property, near Phœnix, Ariz., recently sold to Eastern capitalists for $40,000, is reported to be giving great promise under development. If the prophecies of old miners prove true, it will be a large camp before long.

IN his annual report the superintendent of the Con. Cal. & Virginia says that the output of the mine for the twelve months ending September 30, 1895, was 10,255 tons of ore, extracted from the 1650 level down to the sill floor of the 1750 level, which amount of ore yielded $401,807.64, being an average yield of $47.95 per ton. The bullion carried $250,750.33 in gold and $241,077.31 in silver. The coin value of the bullion was $364,556.51.

CHARLES BUTTERS, an old California miner, is now in charge of the Rand Central Ore Reduction Co., equal in extent of output to any ore working institution in the world. Under his supervision a monthly average of 33,000 tons of ore and tailings is treated.

CONTRACTS with the large silver producers run with the smelters to the first of the year. In many of these contracts the allowance for silver and lead and for treatment charges is fixed, regardless of quotations, so that the weekly figures apply mainly to small lots of ores.

OLIVER ROBERTS, who has just returned from Silver Lake, Douglas county, Nev., declares "there's more gold in Buckeye canyon, near Carson, than in any other one place on earth." He thinks there will be considerable activity there when the snow melts next spring.

CHAS. ALLENBERG, general manager Altoona Mining Co., says that the company has about 100 men employed producing 20 to 25 flasks of quicksilver daily. A new shaft has been sunk from the present level 65 feet and will be continued 210 feet below the lowest level, giving a depth of 430 feet.

THE allegation that a new miners' association is in process of formation, composed exclusively of hydraulic miners, is of that style of information usually called "newspaper talk." The miners realize that "in union is strength," and that the motto of those opposing them is "divide and conquer."

C. B. RICHARDS, a Colorado smelter owner, and C. J. Josselyn of San Diego have bought a controlling interest in the Silver King and Standard mines, carrying gold, silver and copper, in White Gold Basin, Picacho district, San Diego county, and propose to immediately erect reduction works.

THE Con. Cal. & Virginia Mining Co. has arranged with the Nevada bank for sufficient money, when needed, to carry it without levying assessments while exploratory work on the 1000, 1650 and 1750 levels is being done. This month there will be another large accumulation of ore, so that the Morgan mill may again be started.

RENEWED interest is taken in the report that one of Tuolumne's great gold producers—the Rawhide mine, owned by Nevills, Martin and Ballard—is incorporated on a $5,000,000 basis, the new concern being known as the Rawhide Mining Co., of West Va., and is listed on the Boston Stock Exchange, along with the Santa Ynez, the Merced, and others.

THE Butte Bimetallic Union has collected $7519, nearly one-half the amount assessed to the State of Montana. The Colorado Co. and the Boston & Montana Co. each subscribed $1000, and the Butte & Boston, Montana Ore Purchasing Co. and A. W. Clark $500 each. C. C. Rueger, for Walkerville citizens, handed in $110.50, and the First National bank donated $250.

SAN FRANCISCO silver shipments to the Orient in '95 show that the natural laws of trade work out their own conclusions. For the first nine months of the year specie went across the Pacific from this port to the aggregate value of $19,981,421; London specie shipments for the same time to the east aggregated $24,426,035. For the corresponding nine months of '94 the London shipments were $37,015,850.

THE Supreme Court of New Mexico has rendered a decision in favor of the Maxwell Land Grant Company in the suit of the Bent heirs, involving a twelfth interest in the Maxwell land grant, valued at $500,000. This celebrated case has been in the courts over thirty years. It grew out of a claim of the children of Gov. Charles Bent, who was killed in the revolution of 1847 at Taos. The present decision quiets the title in the Maxwell Company.

AT Plymouth, Amador county, the cost of mining and delivery of ore to the mill averages about $1.85 per ton, which includes the cost of necessary prospecting and opening of ore reserves. Milling is done for from 70 to 90 cents per ton, including concentrating, in mills having a capacity of 25 tons or more per day. The local estimate is that ore bodies averaging three feet in thickness and containing only .15 oz. gold, or $3 per ton, can be worked profitably.

FIFTY-FOUR new gold mining companies organized in this State in '94; so far in '95 fifty-eight new mining companies have filed articles of incorporation. It is believed every one of those organizations have incorporated for the bona fide object of working gold mining properties. There is no other industry in this or any other State that is exhibiting such activity, and the simple fact without any elaboration illustrates the present vitality of the California mining industry and its business importance.

THE sulphur deposits in Calcasieu county, La., are being developed by Cleveland, O., men. One hundred tons of sulphur per day are being raised to the surface through quicksand. It is thought the product of the mines will be great enough to supply the world with a fine quality of sulphur, and the United States will be emancipated from the Sicilian product. This country has been paying $2,000,000 annually to Sicily for sulphur. A big drop in price and an equally large increase in sulphur consumption is predicted.

THE Supreme Court of the State of Nevada decides that a partnership agreement to locate mining claims being within the statute of frauds, one partner cannot claim an interest in a claim located by another under an oral agreement that they should be partners in all such locations, when no trust arises because partnership capital was employed in locating the claim. Equitable relief may be given against the partner holding the legal title when the property has been acquired by partnership capital upon the theory that a resultant trust exists—a trust arising by operation of law, and within the exception of the statute.

THE Kaslo & Slocan Railroad is finished and will be accepted by the Canadian government this week. One of the richest mining regions in the Northwest will be given closer connection with the outside world. The road extends from Kaslo, on Lake Kootenay, to Cody, thirty miles to the southwest, and penetrates a country literally lined with mines. The list shows the Black Fox and Montezuman, five miles from Kaslo; Texas and Eureka, sixteen miles; Whitewater, Miner Boy and Lucky Jim, twenty-one miles; Washington, Surprise, Antoine, Best, Rambler, Dardanelles group and R. E. Lee, twenty-four miles; Slocan Star, Ruth, Wonderful and Wills group, at Sandon; Last Chance, Noble Five, Deadman, Reco, Bluebird and American Boy, at the end of the track. The new railroad will be operated by a company headed by John Hendry of New Westminster, B. C. Connection will be had by boat with the transcontinental lines.

HIRAM EVINGTON and family went to Portland, Or., lately from Silver City, Idaho. Sickness occurred, Evington was unable to find employment, and they were on the verge of starvation. One child died and the father became ill. When hardly convalescent he went to the river and jumped into it to drown, but was rescued by a boatman. An old acquaintance persuaded Evington to go prospecting with him in southern Oregon. He consented and they found a claim which they sold for $15,000. Next day his wife received a telegram from Dubuque, Iowa, saying Evington's brother had died, leaving him $8000 worth of property. Now he's glad he's alive.

THOS. FULLEN of the Altaville foundry is reported by the Calaveras *Prospect* to have invented an apparatus for preventing sticks, twigs, grass and other floating rubbish from entering hydraulic or other pressure pipes, which does away with the method of putting racks and sieves at the entrance of these pipes to catch rubbish. It is an overshot wheel the width of the flume, covered with coarse wire screen, and revolving around the section of flume which leads into the sand-box. As rubbish comes down the stream, it drops on this wheel and is cast off to one side while the water passes through the screen and into the section of flume entering into the sand-box.

THE Sacramento *Bee* says that Valentine's rock dam, in Shasta county, built last year under permit, has been carried away by high water, with all the debris that has been placed behind it. The Shasta *Courier* says the statement is just a plain, ordinary lie. The *Courier* further says that the dam near Horsetown is as solid a structure to-day as when accepted by the U. S. Debris Commission; that it retains debris and is as permanent as the eternal hills. It is seven feet high, and seven feet more will be added to it this season, and the mine whose debris it impounds employs only four men, and debris could never injure the river, which is miles distant, even if the dam were not there. It is just as well now and then to show those valley falsifiers up. A cause that depends upon falsehood and misrepresentation is in a bad way.

THE Anti-Debris Association's letter to Hon. Grove L. Johnson, in answer to an inquiry as to what legislation they wish at the hands of Congress, is modest. Congress should at once come to their relief, but they add that hydraulic mining, which has added millions to the wealth of the nation, is a private affair, and of no more concern to the public than any country blacksmith shop. "Any legislation that shall provide for the reopening of hydraulic mines, coupled with the improvement of the navigable streams, we shall oppose with all the means in our power," says this public-spirited association. Congress should protect our interest at public expense, they say in so many words, but we will not submit to share in any tax that shall aid the hydraulic miner. The Calaveras *Prospect* thinks this is patriotism of a new kind, which will probably have due effect upon our distinguished representative in Congress.

THE New York *Financial Record* can always be depended upon for a unique mining item. This week it says: From what is known as the Forks of the Creek to Golden, on the stream known as Clear creek, Colorado, is probably the only placer mine in the world that renews itself as fast as it is worked out. The stream receives the tailings from several thousand stamps pounding on ore above at the mines, and the owners work down one side and let the bulk of the stream run down on the other side. It takes about three years to work the length of the claim. By that time enough gold has been lost by the mills to make good diggings on the other side, and so it keeps up. The sluice boxes, after they are worn out, are put up at auction and the buyer proceeds immediately to make a bonfire of his purchase. One lot we know of cost $150 and made a rather costly amusement; but as the owner realized $700 in gold from the ashes, his fun proved quite profitable.

THE Placerville *Democrat* wants a league of mountain editors formed, especially since the valley press league was started apparently to fight the mining interests. The editors of the mining counties have no desire to make reprisal on the valley editors, but wish to protect mining interests, and at the same time perfect amicable arrangements with the valley people, that no harm may be done them whatever in taking out gold, the main product that makes California at all prosperous. With a proper organization of mountain editors much good may be accomplished and a better understanding arrived at in settling the conflict between the mining and farming sections, to the great benefit of both. The valley people along the Yuba and Feather rivers would stop all kinds of mining throughout the entire State if they could, although professing only to object to hydraulic mining. If the farmers were at the head of a stream and the miners below, they would feel greatly dissatisfied if stopped from letting their irrigating ditches and drainage from farms go into streams.

THE report of Director of the Mint Preston on the production of the precious metals in the United States in 1894 places the production of gold at $39,500,000; the coinage value of the silver production is given at $64,000,000, while the commercial value at the average rate per fine ounce during 1894 of .63479 was $31,122,000. The production of silver in the United States decreased from 60,000,000 ounces in 1893 to 43,500,000 in 1894. The total gold imports for the year were $21,359,607 and the total exports $101,988,753. The exportation of gold is credited with having decreased the total stock of gold coin in the United States from $663,013,158 on January 1, 1894, to $577,182,792 on January 1, 1895—a loss of $86,730,366. A fairer statement is that of the total metallic stock of the United States at the corresponding periods, this, of course, including the bullion held by the Government and privately. It shows $624,289,758 in gold coin and bullion on January 1, 1895, against $668,998,964 on January 1, 1894. The contraction in the amount of money (paper and metallic) in circulation between the same periods amounted to $103,428,783, due mainly to the exportation of gold. Director Preston believes that not less than $50,000,000 in gold was taken from the world's production for industrial consumption in 1893, while of silver it is estimated that 663,000 kilograms, of the commercial value of $16,622,980, was similarly used in the same year. He places the world's industrial consumption of gold for 1894 at over $52,000,000, while the consumption of silver he places at over $33,000,000.

The Sampling and Measurement of Ore Bodies in Mine Examinations.

NUMBER II.

By EDMUND B. KIRBY.

SAMPLING ORE "IN PLACE."

1. A large number of small samples for assay, each of which is quickly and roughly taken, are cut from lines distributed at small intervals over the area of each plane section.

2. A limited number of large samples for assay, each carefully and laboriously taken, are cut from lines distributed at wider intervals.

3. Mill-runs. In this system each sample is either sent to a mill where its actual yield is ascertained, or it is shipped to some sampling or smelting works where an assayers' pulp is prepared from it by accurate sample reduction with machinery. The samples are very few in number on account of the time and expense required. In the first case each one must be large so that it may be milled by itself and furnish enough product to clean up. In order that a sample may be representative, it is generally composed of ore from several points.

4. Panning in a miner's gold pan or horn. This test is applied to a large number of very small samples, each of which has been roughly taken and pulverized for the purpose on a stone, or huck-board, or in a mortar.

The first system is adopted to save time and expense whenever the second or third is unnecessary. There are many samples to assay, but the work of taking each one is small. It gives correct results only when applied to soft ore bodies where the sample may be cut out easily and uniformly by pick, gad or moil. The method is permissible only when the richest portions of the ore are not too much scattered in spots, streaks, or special layers, and are not too high in grade. In other cases it is applicable to very thin sheets of ore. It is frequently used on sections of probable ore, and for daily working samples in the operation of a mine, or in other cases where a quick, rough approximation is desired. Each sample may be small, requiring reduction to only half or one-fourth its bulk for the final package; again, it is often sufficient to break so little from the point that it may be sent entire to the assay office. There may be a large error in any single sample, but this is balanced in averaging by the great number taken.

The second system is necessary for all hard ore (requiring blasting), and for bodies in which the variations of value are great, or where the richest portions are irregularly distributed. It is always expensive and laborious, but generally the most accurate method, and is therefore most frequently employed. The sample broken is always large enough, from 25 pounds to 50 tons, to correctly represent the variations along the line of its cut, and is reduced to a small package for transportation to the assay office. Each sample is accurate, the error involved in the system being that due to the wide intervals between samples and the small number to be averaged.

The third system of "mill-runs" is rarely adopted unless a mill happens to be close at hand and the ore body is of such size with values so variable or scattered that samples by the second system would be very large (10 to 50 tons), and the work of hand reduction therefore very great. If mill-runs are sent to a sampling or smelting works, the expense and delay is generally greater and the results are more serviceable than those of hand reduction at the mine. Mill-runs are more useful for metallurgical tests than to determine the value of ore in place. For the latter purpose their results are frequently deceptive and they are therefore dangerous in unskilled hands. This is because each mill-run is so tedious and expensive that few are made, and thus but a few scattered points of the ore deposit are tested. If each sample is composed of ore from various points, it is practically impossible to have the right proportion from each one, and the result is also subject to the serious errors of mixed samples. Again, the mill is often metallurgically unsuited to the ore, and it is more difficult to guard against fraud. When it is necessary to use this system, extra money and time should be provided for, and the samples made numerous enough for safety.

The fourth system of panning is restricted to free gold ore and while it is not intended to furnish exact figures of value, it is very useful as an auxiliary method to determine the relative distribution of gold and the limits of pay ore. In the regular operation of a mine it is often used to guide the work, and if checked frequently by assays or mill results, mine foremen sometimes become remarkably expert in judging the exact value from pan tests. This cannot be done with unfamiliar ores, but even then it is generally possible to distinguish roughly between ore above and below pay.

Distribution of Sample Lines.—Each sample is cut along a line, making a trench, or groove, of the same dimensions throughout, and so placed as to cross any principal lines of variation in the grade or character of the ore. The lines of sample cuts are impartially distributed over the area of the plane sections adopted, in positions as nearly equi-distant as possible. The boundary between pay ore and low grade, or waste, is provisionally fixed by judgment. If in doubt about a low-grade streak, a separate sample is made of it. The width sampled is always the width measured.

Taking Samples.—In the first system the sample cuts are shallow, uniform grooves, say three to six inches deep, and generally within two or three feet in length.

In the second system the quantity broken is fixed partly by the length of the line and partly by the distribution of values along it. The usual range is from 50 to 400 pounds. In order to secure reliable averages across a large and spotted ore body the writer has found it necessary to break 25 and even 80 tons of single samples. These extreme quantities, however, were tested by mill-runs. The trench, or groove, is blasted out, and afterwards trimmed to uniform dimensions. Large samples, exceeding say 300 or 500 pounds, may be received upon the bare floor of a level, but when the bulk is less it is handled on canvas. This is protected from injury by covering with loose plank before blasting.

It greatly facilitates the subsequent reduction of the mass broken down to work upon a smooth surface. Thus, where many samples are to be taken along levels, it is best to lay temporary platforms, made of loose plank, beneath the sample points. A platform may be moved and relaid in ten minutes, and for a heavy piece of work three will do for a working force of one assistant and ten or twelve miners. In taking samples down a shaft or winze, a temporary platform is placed at each point. Work done in stopes also requires the use of movable platforms erected in any convenient way.

Samples from Loose Material.—In mine examinations it is frequently necessary to take samples from loose ore, dumps, mill tailings, etc. To obtain a sample of ore which is being extracted, one or more shovelfuls are taken out of each bucket or car, and thrown into a pile to make the sample. In the case of sacked ore, a few pounds are taken from the top of each sack, or when greater accuracy is necessary every second or fourth sack is emptied on the pile. A pile of ore on the dump may be roughly sampled by taking one or more shovelfuls from each one of many points, distributed at equi-distant intervals over its surface. The only safe method, however, is to drive several open trenches or tunnels through the mass, taking, say every tenth shovelful for the sample. For a dump of mill tailings, a boring tool is used, made of a 16-inch piece of two-inch pipe. This is easily carried to the mine and attached to a handle of convenient length. The dump is pierced by bore holes at equi-distant intervals, and the borings from each hole are reduced and assayed separately.

Reduction of Samples.—The reduction of a sample from its original bulk to that of the assayer's package, does not differ in principle from the process followed at sampling and smelting works, but requires less accuracy. Moreover, instead of using machinery and routine methods, the reduction must be made on the spot by hand, upon samples varying greatly in grade and quantity, and under every disadvantage of underground conditions, from showers of water to the cramped quarters at the bottom of some narrow hole. Therefore no two samples are reduced in the same manner, and fixed rules are impossible, so that it becomes necessary to recount with some detail the fundamental principles of the process as applied to underground work. It is not, however, within the purpose of this paper to enter into the many practical details of manipulation, although accuracy in hand reduction depends largely upon skill in these small points.

The process of reduction requires the continual repetition of two consecutive operations. First, crushing to a certain minimum size; second, the impartial selection of a fractional portion of the mass. The latter operation comprises the two consecutive acts of mixing and cutting, these being performed once or several times until the definite fraction desired is obtained.

Whatever final limit of error is permitted for a given sample, it is a rule that at each repetition of this series of operations they must be performed with more care than before. In consequence of this a very large sample requiring many repetitions of the series finally reaches a stage where so much care and accuracy are necessary that handwork is too laborious. At this point the sample, whatever its bulk, should be made up into the final package and sent to the assay office where crushers, grinders, the buck-board, and fine sieves are available for the final operations. Thus the bulk of the final package is fixed by deciding whether it is better to incur the expense and delay of pushing reduction a step or two further at the mine, or, on the other hand, to bear the cost of transporting a greater weight to the assay office. In practice the packages generally range between four and ten pounds, and frequently reach twenty-five and fifty pounds, especially when the assay office is near.

Crushing.—The ore is broken so that no lump shall exceed the maximum size decided upon. Very rich lumps are broken smaller in order to distribute their value. During the final stages of reduction a pair of sieves with ¼-inch and ½-inch meshes are useful to separate out those lumps which require breaking.

Relation of Maximum Size to Bulk.—The instinctive judgment derived from long experience in sample reduction is necessary to promptly decide the maximum size and the fraction to be selected at each series of operations. These must be so taken as to keep the work within the limit of error allowable, and at the same time have it move rapidly. Since this relation of maximum size to bulk depends on several variable conditions, and is never the same for any two samples, it is impossible to illustrate it in a very satisfactory way. The first column of the following table will, however, give an idea of the maximum sizes selected by general judgment for two typical cases of reduction.

TABLE ILLUSTRATING THE RELATION OF MAXIMUM SIZE TO BULK IN TWO TYPICAL CASES OF HAND REDUCTION.

An average ore is taken, containing $10 to $50 per ton, and it is assumed that the richest lumps of full size do not assay more than five times the above value.

	Sizes Adopted in Practice.	Theoretical Sizes as Calculated by Reed's Formula. Maximum Sizes of Lumps (Diameter in Inches) Allowing a Limit of Error of	
		5%	10%
CASE I. Reduction of an 1800-pound sample to 7 pounds by taking one-fourth after each crushing.			
1800 pounds prepared for reduction by crushing to	4 in.	3 in.	3.8 in.
The 450 pounds prepared by crushing to	2	1.9	2.4
The 112 pounds prepared by crushing to	1	1.2	1.5
The 28 pounds prepared by crushing to	0.5	0.75	0.9
And then reduced to 7 pounds.			
CASE II. Reduction of a 300-pound sample to 5 pounds by taking one-fourth after each crushing.			
300 pounds prepared for reduction by crushing to	2.5 in.	1.7 in.	2.1 in.
The 75 pounds prepared by crushing to	1.0	1.0	1.3
The 19 pounds prepared by crushing to	0.5	0.6	0.8
And then reduced to 5 pounds.			

Reed's formula is the result of an effort to find a rule which will express mathematically the effect of the aforesaid conditions for any case. It does this in a very satisfactory manner for the accurate work of sampling and smelting works where the limit of error is 1%, and it is of interest here to compare the above figures taken from practice with its theoretical results. The other two columns therefore show the sizes calculated from the formula for the limits of error of 5% and 10%.

The differences between these and the practical sizes are mainly due to the fact that for hand reduction several of the constants used in Reed's formula change with each repetition of the series of operations. There are also more repetitions than with machine reduction.

The three following methods of mixing are used in mine work:

1. *Pouring* from one pan into another. This imperfect method is used only in the final stages of reduction, and when it is to be followed by riffle cutting.

2. *Rolling* in canvas. This is the best method known, and is used whenever the sample is small enough to handle, say under 200 pounds.

3. *Coning.* The sample is shoveled into a conical pile so as to secure a uniform radial distribution.

The care used in mixing depends on the method of cutting which is to follow. Quartering requires very accurate mixing. It is not necessary for shovel or riffle cutting, but even here the work is improved with little trouble by roughly mixing before each cut.

Reasonable Geology.

NUMBER III.

By FREDERICK DANVERS POWER, F. G. S.

By experiment, copper sulphide may be formed by fusion, in the wet way by precipitation, or by pressure. In the latter case Spring found that by subjecting a mixture of sulphur and copper filings to a pressure of 5000 atmospheres copper sulphide was formed. This, though an interesting fact, will hardly assist us in determining how chalcocite is formed in our mineral veins, as we cannot conceive the conditions in nature under which sulphur and finely comminuted copper could be brought to form the mass of mineral we find. If our experiments really follow out the natural condition, well and good; but it is by no means easy to imitate nature, or to carry out our experiments under exactly the same conditions as they are in her laboratory, where time and dilute solutions play such important parts. Many ingenious experiments have been performed, which have subsequently proved to be useless for demonstrating how certain results have been caused, because those who experimented did not sufficiently study the subject they wished to imitate.

The difference between theories promulgated by scientific and ignorant men is that the former base theirs on a wider range of well-digested facts, gained from all sources, and tested in various ways, whereas the latter are limited to the narrow circle of facts and ideas pregnant with false notions and prejudices with which they are familiar.

To form a correct judgment, one should possess reliable information and a thorough knowledge of one's subject, as well as an unprejudiced mind in considering it. Still, correct results are at times obtained, though false means are employed. The conclusions in such cases are not got on account of the false reasoning, but in spite of it; it is mere chance, and cannot be relied upon. The conclusions of those who observe and think in a superficial manner, and who are ready to jump at the first idea that presents itself as a solution to a question, are not to be trusted, notwithstanding that with the greatest assurance, devoid of the slightest misgiving, they tender their opinions. It never does to take anything for granted when it is possible to investigate it. Some people are so prejudiced against, or in favor of, certain theories that they put everything down to them, and refuse to inquire into anything opposed to their views. Alchemists in the olden days, seeking for information about the transmutation of metals, were satisfied with obtaining certain results without knowing the reason why. They observed when iron was placed in a solution of sulphate of copper that, after a time, the iron was converted into metallic copper. This was a favorite example of theirs to illustrate the possibility of one metal being changed into another. Unfortunately, they overlooked some vital points that greatly affected their reasoning, and which would have shown them that it was not a matter of one metal changing into another, as they understood it, but merely that there was an exchange of the condition of the metals, the copper replacing the iron in the metallic state, while the iron forming a sulphate passed into solution. People are apt to generalize on insufficient grounds, such, for instance, as the Plutonists, who put everything down to the action of fire, and their opponents who, equally bigoted, credited water with being the cause of all our rock formations. Forming conclusions when there are not sufficient data to warrant one in doing so has frequently caused expensive mistakes, such as the mining of baryta for cerussite, persisting in looking for a lost lode on the side of the greater angle only, etc.

Cause is sometimes confounded with effect. The presence of a fossil shell in a phosphate deposit may be taken by some as indicative that the phosphate had its origin in the mollusk, whereas in reality the phosphorus may have been concentrated in the shell from outside sources, long after the creature had been dead and buried.

Some evidence we have is as certain as such evidence can be, and still we are unable to prove it. Under these circumstances, we only accept it provisionally. It may be necessary to drive a point to an absurdity in order to prove or disprove it, and thus get one step nearer the truth. The boundary between two things is often so vague, they merging gradually one into the other, that it is difficult to see where one begins and the other ends. In such cases, much light may be gained by comparing the extremes, the difference being thus more obvious.

Many people are led astray in their conclusions by the apparent cause or origin of a phenomenon, which is really due to another entirely different one. How frequently do geologists have dendritic markings, found, perhaps, in some igneous rock, brought to them with the request that they will name the fern or moss, whichever it is its owner fancies it resembles. It requires but a slight knowledge of botany to discover that, though at first sight the manganese or iron oxide has apparently taken upon itself the form of a plant, yet, on closer inspection, the figure is not that of an organism, while further observation enables us to conclude, and experiment to verify, how such imitative forms are caused.

We cannot be too cautious in respect to negative results. It would never do to conclude that because the gravel of a river comes from the rocks of its watershed, if you are unable to discover fragments of some soft rock you seek among the pebbles, therefore this soft rock does not exist within that area. It is quite within the range of possibility, and highly probable, that the soft rock was unable to live among the harder debris, and became worn to sand or silt.

Sometimes it may seem as if one single accompaniment was sufficient cause for a particular result, but in reality there are others that are necessary. The presence of nuggets in alluvial deposits was originally put down to the disintegration of auriferous veins; and although some are no doubt due to this cause, yet there are many facts in connection with alluvial gold that this origin will not account for, such as the greater purity of alluvial gold over that found in the neighboring reefs; the presence of large masses of heavy gold, not at the bottom of the drift, as one would expect if rolled about in a stream, but within a few inches of the surface, as in the case of the great "Welcome Stranger" nugget, which weighed 2280 ounces. Careful experimenters and observers are inclined to favor the idea that the gold in such cases has been deposited out of solution.

The age of a rock cannot be told by its lithological characteristics alone; those of the same age may vary greatly, while those of different periods may be of similar composition and structure. The age of a conglomerate, it is true, may be limited, to a certain extent, by noting the rocks of which its pebbles are composed, if we know the age of these rocks; but then the absence of other rocks is only negative evidence, of which we must beware for reasons given above. Besides, we cannot determine the exact watershed of past days, not knowing the elevation of the land in ancient times, or the extent of disintegration that has taken place. To confirm our opinions as to the age, we need to follow out the sequence of rocks, and take the remains of the flora and fauna found into consideration.

It is often of interest to learn the order in which minerals have been deposited in veins. Take the case of a stanniferous granite vein. We have here reason to think that the more basic cassiterite first formed, then the mica, followed by the feldspar, and lastly by the quartz. The mica is more uniformly crystallized than either the feldspar or quartz, and frequently encloses grains of cassiterite. It also leaves the impression of its laminæ on the quartz, which seems to be the silica in excess of what is required to form the silicates accompanying it, and consequently fills up the interstices between the other minerals.

(To be Continued.)

OFFICE BUILDING OF GOLDEN GATE PARK COMMISSIONERS. *(See page 281.)*

Electric Power for Long Distance Transmission.

For periods of time ranging from two years down to a few months, not less than fifty power transmission plants have been working regularly in different parts of the world, ranging in magnitude from Niagara down to fifty horse power and in distance from the Folsom-Sacramento transmission, in the United States, having an extreme length of about twenty-five miles down to a mile or two. All these plants have been singularly free from trouble and have done their work well.

Admitting that distances up to twenty or twenty-five miles can be successfully overcome, is there a reasonable probability that the transmission of power can be extended over distances much greater? Yes, if necessary. We have no plants over twenty-five miles, but the methods and apparatus for longer transmissions have already been thoroughly tested, and up to at least fifty miles we are sure of our ground—perhaps up to a hundred miles. The transmitting and receiving machinery would be quite identical whether the line between them were twenty or fifty miles long, so that, as regards apparatus, the ground is well trodden.

For very long transmissions high electrical pressure is necessary to keep down the cost of the line, since the amount of copper required to meet given conditions decreases with the square of the voltage. And we have already experience with the voltage just as with the apparatus—at least with voltages ample for a fifty-mile transmission. For example, without counting the famous Lauffen-Frankfort experimental plant, with a line 108 miles long, and operated part of the time at a pressure of nearly 30,000 volts, there are now in commercial service four plants, running steadily and successfully at pressures of 10,000 volts and more. Chief among them is the Oerlikon installation in Switzerland, working at over 14,000 volts; then come Folsom-Sacramento, in the United States, and Guadalajara, in Mexico, at 11,000 each, and finally the San Antonio canyon plant, in the United States, at 10,000. The first and last mentioned have been in operation nearly three years without having encountered any appreciable difficulty from the very high pressure. The other two have been operated some months without a trace of trouble. From these experiences there is the best of reason to believe that voltages up to 14,000 or 15,000 are entirely justified by present practice.

Concerning distances of 100 miles or more, and pressures exceeding 15,000 volts, we have only the results at Lauffen by way of data. While these make no pretense of representing commercial practice, they still are good evidence that, as an engineering feat, a transmission of a hundred miles at 25,000 or 30,000 volts is quite practicable. While the feasibility of covering far greater distances at much greater voltage is more or less a matter of speculation, those who know most about the difficulties to be met fear them the least.—Dr. Louis Bell in Cassier's Magazine for November.

Recent Additions to Museum of California State Mining Bureau.

Native sulphur, Santa Paula, Ventura Co., Cal.

Rich copper ore, Inyo Co.; S. G. Gregg.

Several specimens of varieties of ulexite, Mesquite Valley, Inyo Co., Cal.; W. C. Chapin.

Curiously contorted slate, found in middle of quartz ledge, Sutter Creek, Amador Co., Cal.; Hon. E. C. Voorhies.

Auriferous barite (sulpbate of barium), Morning mine, Butte Co., Cal.; J. R. Scupham.

Fine crystallized azurite, Copper Queen mine, Arizona; Ben Williams.

Platinum (nugget), French mine, near Junction City, Trinity Co., Cal.; Mons. E. Saladin.

Gold in calcite, Bonanza mine, Minersville, Trinity Co., Cal.; Mrs. Tourtellotte.

Gold quartz, Three Sisters mine, Shasta Co.; Ellery Bros.

Five specimens gold quartz, Cripple Creek, Col.; E. Smith.

Eight specimens gold quartz and other ores, from Mono and Inyo counties.

Asphaltum—Remarkable porous variety, from the Patera mines, Santa Barbara Co., Cal.

Auriferous granite, from a ledge being successfully worked at West Point, Calaveras Co., Cal.; F. McMillan.

Two hundred and fifty-pound specimen of gold quartz, from the Madrone mine, Pioneer district, Volcano, Amador Co., Cal. Ledge is in granite. W. Q. Mason.

Very rich copper ore, chiefly erubecite, carrying thirty ounces silver and a little gold per ton, Cosumnes mine, El Dorado Co., Cal.; John Theisen.

And a number of other ores, rocks, etc.

Sent to the Bureau by Col. D. H. Jackson a remarkably fine specimen of variscite, from Belle Hill, Candelaria, Esmeralda Co., Nevada.

H. L. DURDEN, Secretary.

Mining Summary.

CALIFORNIA.

Amador.

IRON MASS. — *Ledger:* The owners of the Iron Mass mine, in Volcano district, sunk their shaft down 100 feet, and now are drifting. They have the drift in about forty feet. The ledge in the bottom of the shaft is 3½ feet wide and on the drift measures from 18 inches to 3 feet in width. They are progressing in the ledge taking out and storing the ore. They are using a double bucket horse whim. The ore they are taking out is even better than that crushed which went about $40 in free gold and 20 per cent sulphurets. The sulphurets have never been assayed but show gold in open fire tests.

Calaveras.

THE TULLOCH MINE.—At the Tulloch mine near Angels recently bonded by N. S. Wright, the shaft is down 150 feet, north and south drifts along the vein are being run. Thirty men are employed. The ten-stamp mill will be in operation in two weeks.

THE MACHU MILL. — The regular weekly cleanup of the Machu mine mill made Sunday yielded $703.40 for about sixty-four tons of ore. The north extension of the mine, owned by Mrs. Gray, has been bonded by the company.

THE GOLD HILL MINE.—Ten stamps are to be added to the mill at the Gold Hill mine, the ore body justifying the increase.

THE ECLIPSE.—Local authorities claim that the Eclipse Mining Co. claim that sinking the shaft on the flat was a mistake, and that the desired result would have been attained by following the lode down on the west side of the hill.

El Dorado.

THE POCAHONTAS.—The *Republican* says a few men are employed at the Pocahontas mine by D. W. C. Morgan, south of El Dorado, and are engaged in cleaning out some of the old works. The mine was famous for rich bodies of ore in early days and the surface has been thoroughly worked in all directions surrounding the shafts. Two interesting relics of ancient mining methods are to be found on the ground in the shape of an old arrastra and a Mexican mill. The latter comprises two large discs of stone six or seven feet in diameter and fifteen inches thick, each having a square hole in the center like a Chinese "cash," and mounted on a stone base around which they revolve in a circle when in operation. The three stones and the base on which they staud would have attracted much attention at the great fairs in Chicago or San Francisco. They look very much like two great cheeses on edge and resting on a larger one lying flat.

THE BLUE GOUGE.—The Blue Gouge mine, which John W. Mackay, James L. Flood, A. E. Hand and Superintendent Kervin of the Comstock went to see recently, is a low-grade proposition. It is a hig deposit of talcose slate, filled with small seams and veins of quartz, running in all directious and forming a sort of network. Such seam diggings in places are profitahly worked hy hydraulic process. The second hest mine in Siskiyou county is of this character. It is worked by How & Co., Chinese, who represent the See Yup, one of the six hig companies of San Francisco, and has been mined nearly thirty years. It is worked by hydraulic process, running day and night.

Inyo.

GENERAL NOTES.—J. Knupple, has shipped sixteen tons of silver and lead ore from his claim near Cerro Gordo.

F. Winkler has leased the Confidence mine, formerly known as the Sterling or Cuba mine.

It is reported that a fine body of ore has been struck hy the Darwin Development Co., near the Defiance mine.

O'Brien and Kennedy have leased the mines at Minnietta from J. J. Gunn.

Mariposa.

THE TYRO MILL.—*Miner:* The Tyro mill is running steadily and the ore from the new hody recently opened up on the 600 is more than meeting the expectations of the managers. The force of men has been increased during the past two weeks, and matters are now moving along their old-time familiar lines. Superintendent McLaughlin feels elated at the good showing being made and confidently looks forward to finding a higher grade ore on the 700 than is the case with the 600.

Plumas.

RICH GOLD MINE.—Salt Lake *Tribune:* F. B. Lathrop of Minneapolis, who has heen in this city for several days, last midnight left for Quincy, Plumas county, Cal., where he is operating a gold mine which is said to he one of the richest in the United States. With him went Thomas Weir, well known in the intermountain region as a successful mine manager, who goes out with Mr. Lathrop to examine the property.

Mr. Lathrop carries with him the remnant of the collection of gold quartz specimens from Plumas county which received the first prize at the World's Fair, the same collection afterward being awarded first prize at the Midwinter Fair. The collection is as fine a lot of gold quartz as was ever taken out of one mine, and exhibits not only the native gold, but crystallized specimens. One piece in particular attracts attention. It is a large piece of white quartz incrusted with gold, showing some hematite. On one corner of the specimen is a piece of hematite which oscillates with any movement made while holding the specimen. The secret of the oscillation is that the hematite is detached from the quartz, but is still held as a part of the specimen by a wire of gold.

The mine from which these samples were taken is on the Belle mountain, near Quincy, in Plumas county. Below the mountain is the famous Betsy gulch, from which $700,000 of placer gold was extracted from the grass roots in a few months. Mr. Lathrop had some of this placer gold with him, and some of the nuggets weighed over an ounce. These placers are supposed to have originated from the quartz ledge that has been opened up on the mountain, and it is to ascertain the extent and permanency of this ledge that Mr. Lathrop has engaged the services of Mr. Weir.

Nevada.

THE PROVIDENCE.—Rich developments have heen made at the Providence mine. The Providence quartz is usually filled with rich sulphurets, and it is rare that much free gold can he seen. There is an ahundance of ore in sight and the forty-stamp mill is kept running at its full capacity, night and day. They recently purchased a piece of land in the old Hirschman diggings, where they are having a large reservoir constructed, from which water will he taken to the mine to drive the mill and machinery. A large pipe line will be laid, and the flume that now conveys the water through the old hydraulic diggings will be abandoned. Four hundred feet of pipe twenty-two inches in diameter is to he used. The additional forty stamps that the company intend putting up will require the increased supply of water.

THE COAN MINE. — The Coan mine, two miles west of Nevada City, is a continuation of the contact vein on which the Champion and Providence are located. The mine is heing opened, hoisting and pumping plant erected and a 10-stamp mill is to he put up. M. Coan owns the mine and contemplates its sale to San Francisco men.

THE LIVE YANKEE.—At the old Live Yankee gravel claim, near Graniteville, a cooperative company have run a tunnel into the hill 600 feet to tap the channel, at an expense of $1500. A string of sluice boxes will be put in and the gravel now on the dump will he washed.

San Diego.

THE HIDDEN TREASURE.—Messrs. Frary & Johnson are running a level on the Hidden Treasure mine, Julian district. They had a erushing ahout three months ago which went $80 a ton and they are now getting out ore for another crushing. The level is now in 500 feet and 160 feet below the surface.

THE OWENS MINE.—T. H. B. Varney, the hicycle man, is opening up the Owens mine, at Julian, San Diego Co. The 350 shaft has 200 feet of water in it, which will be pumped out, the shaft retimhered and sunk deeper.

Shasta.

THE BRUNSWICK MINE.—H. Cochran, who with Mr. Rossi is operating the Brunswick mine near French Gulch, tells the *Press* that the Lane-Tozier syndicate, which honded the mine a short time ago, has thrown up the bond after running a tunuel 350 feet. Cochran and Rossi, who are working their claim higher up on the mountain, are getting out good ore and are not discouraged by reason of the honders failing to find the ledge. Cochran says that the ledge is irregular, extending down in shelves or steps, dipping first to the south and then to the north. From their tunnel, near the apex, they will sink a shaft a distance of 45 or 50 feet, then upraise from the tunnel that has heen ahandoned.

Sierra.

ACTIVITY AT SIERRA CITY.—Sierra City has had quite a boom in mining lately, says the Downieville *Messenger*. Last week there were several mines sold and honded, among them being the William Tell, Butte Saddle, Keystone, Roman and a mine owned by Mr. Quirolo. There has also been a big strike made on the Cleveland mine. The owners have been prospectiug this mine for five years and at last have heen rewarded hy striking a ledge in their lower tunnel, which is between thirty and forty feet wide and prospects well. Capitalists are beginning to he interested in this part of of the country—at least, the ice is hroken and we expect quite a boom. There are any amount of undeveloped ledges in this section awaiting development to make them good paying properties.

Siskiyou.

GENERAL MINING NOTES.—*Journal:* A syndicate of French capitalists is endeavoring to make a trade for the Bennett mines at Forks of Salmon and also the Red Hill mines on Salmon river. Bennett wants $150,000 cash down for his claim, which is one of the richest in the county, and the Red Hill claim is also very valuable mining property.

The work of developing and opening up the famous Steamhoat mine on McAdams creek still continues with very good prospects. This creek has always paid well, the gold taken out heing of course variety, easy to save in the sluices.

The Espey, Hunter & Co. mine at Hawkinsville continues to show up fine, with good prospect of a rich haul at first cleanup, to he made soon. The pumping machinery works smoothly in raising water to the hydraulic flume from Shasta river. to keep the giants busy 15 hours each day.

Songer & Dame having corked up an old drift, letting a great quantity of water into the old Pacific mine at Klamath river, are now taking out rich pay gravel again, and will continue doing so for over a month yet without further trouble, or possihly longer, if we are to have mild weather in December. Should the wiuter prove a dry one, the claim may be worked all winter, as heavy storms of long duration are required to raise the Klamath to any great extent.

The hydraulic miners at Oro Fino, Mugginsville and Quartz valley are making preparations for the winter season, to start work agaiu as soon as their ditches can he filled up with water to run the giants. The quartz miners in same sections are also getting out quartz and preparing for crushing.

The Horse Creek Mining Company have closed down for want of water. They had quite a large piece of ground stripped, hut could only clean up a small portion. The result, however, was very satisfactory, and the mine has been put in the best condition possible for extensive operations next season. The company owns 300 acres in all, 120 of which has been patented. A large frame boarding house, office building and blacksmith shop have just heen completed. The property will he in charge of Wm. Rohertson pending renewal of operations.

Trinity.

MINING SUPPLIES.—*Journal:* There were unloaded at the Redding depot last week a five-stamp quartz mill and battery and a large rock breaker consigned to the Altoona Quicksilver Mining Company at Cinnabar. The rock breaker alone weighed 5800 pounds without the fly wheel. A carload of sheet iron water pipe 8 inches in diameter and some hydraulic machinery, consigned to the La Grange hydraulic mining company, were also received. Wednesday a complete hoisting plant for a mine was unloaded there for W. C. Given of Junction City.

NEVADA.

ON THE COMSTOCK.—On the Brunswick vein the incline shaft of the Hale & Norcross company is down 160 feet in quartz and porphyry. The incline shaft of the Con. Cal. & Va. and the Best & Belcher companies is down 125 feet, with porphyry at the hottom. The hoisting works are ahout completed. Crosscuts will now be run to prospect the vein. The tunnel being run by the Savage has heen advanced a total distance of 400 feet, passing through porphyry, quartz and clay. Some new streaks of ore from two to four feet wide have been found in the Con. Cal. & Va. A four-foot streak on the 1750 level assays from $40 to $50 a ton. At the Ophir old works an exploration drift on the tunnel level, after passing some broken ground, has reached a formation consisting of solid quartz, assaying $2.50 per ton. The Hale & Norcross company is prospecting and making repairs. From some streaks that are being followed on the 975 level, twenty-eight cars gave an average of $73.58 a ton. The Savage extracted seventy carloads averaging $37.99. On the 950 level they have an upraise which has penetrated ore assaying $40 for a distance of five feet. While awaiting a milling-stage of water in the Carson river most of the mining companies are making repairs.

AN ELECTRIC PLANT FOR KENNEDY.—*Silver State:* O. W. Schweitzer, representing the New Era Gold Mining and Mill Company, has sent an order to San Francisco for the shipment of the electric milling plant, which is to he put up at Kennedy. The plant has heen thoroughly tested and found satisfactory. It will be shipped at once, and Mr. Schweitzer thinks the mill will be ready to start up by the first of December.

WHITE PINE COUNTY.

ELY DISTRICT.—Gold ore is reported struck in the Rob Roy south of the Chainman and Joana.

Parties doing assessment work on the Emma mine, in West Camp, found a hody of ore at the surface about five feet wide, assaying 60 per cent lead, 43 ounces silver and five dollars in gold, worth $65 a ton here.

ROBINSON DISTRICT.—Assessment work on the copper claims shows rich oxides on the Star, Star of the West, Monitor, Brooks and Pilot Knob. The lodes are large and wherever iron is found with the copper hear both gold and silver. Wherever sulphides of copper are found they also contain gold and silver. While the ores near the surface are chiefly the green and hlue ores and red and black oxides some sulphides are here and there found mixed with them.

LINCOLN COUNTY.

DE LAMAR WATER SYSTEM.—*Tribune:* The new water system being put in from Meadow is complete; over 100,000 gallons of water are heing delivered in De Lamar daily.

The new 120-ton cyanide addition to the mill will supersede the supply of the chlorination plant, the capacity of the mill will he doubled, and Capt. DeLamar is arranging for a capacity sufficient to treat $250,000 worth of ore each month.

The mine, according to reports, will not fail to supply the ore necessary for this increased milling capacity, as there is said to he a vein 100 feet thick of ore that runs $60 in gold per ton.

ARIZONA.

GENERAL NOTES.—*Oasis:* The Ripsey mine in Pinal county, closed down some months ago, has resumed operations, under lease to Otho Moses.

The Planet-Saturn Company in Yavapai county, is pushing work on its claims and taking out good ore. It is sacking up and shipping ore which will run $125 to $250 per ton.

The Cusenherry Co. have secured a promising gold and copper property east of Ehrenherg. Harrison, Curtis & Co., have secured three of the old copper and gold mines in Cuningham pass, north of the Cusenherry mines.

There are ten men at work on the Moscow gold mine, Agua Fria district. A test run of four tons of ore from this mine plated $48 per ton. Roberts' mill on the Agua Fria, is located just four miles away and owners of the mine are trying to lease the mill.

Nine men are at work on the Poland-Hamilton mine on Big Bug. A tunnel is heing run to tap the working of the Belle mine, which is owned by the same parties that own the Poland-Hamilton.

Work is heing pushed on the Last Chance mine, near Prescott. Eight men are now at work in the mine, where drifting is being pushed hoth ways from the bottom of the 175 foot shaft, workings heing in good milling ore.

THE UNITED GLOBE. — *Silver Belt:* The United Glohe mines increased their force this week and are now employing 45 men in their mines and in making surface improvements. The smelting plant will be almost entirely reconstructed and ore bins built. It will require at least six weeks to finish the improvements already begun and putting everything in shape for smelting. Harry Zschoeger has heen placed in charge of the mine work as foreman.

OREGON.

CURRY COUNTY.

KERBYVILLE. — Jacksonville *Times:* The business men of Kerby are now experiencing an old time mining boom and the little burg presents about the same life it did in the 50s. Hotels are crowded, pack trains are loading, and the stores are crowded with men going to the mines in the vicinity. A person cannot go toward any point of the compass and miss a mining camp. On Althouse, up the Illinois river, down that stream, west of Kerby on Josephine or Soldier creek, any direction one strikes mines and mines. It is thought that fully 1000 men are now in the vicinity, all actively engaged in mining or prospecting. Kerby is the distrihuting point for the whole region and is centrally located.

WASHINGTON.

REPORTED COPPER STRIKE.—A Springdale, Wash., special says excitement provails over a strike made by Jones Bros. of that place, in the copper district along Deer creek, of a 40-foot vein of copper pyrites which contains gold. There is said to he 2000 tons of shipping ore in sight. Many people are going in there and ground is being staked.

CAUSED A STAMPEDE.—Messrs. Wheeler and Maxwell who have been doing some work on the Iron King mine near Spectacle lake, Okanogan county, recently hroke through the iron capping when they reached ore which assayed $30 to $50 per ton. When this became known a regular stampede took place and within two days twenty claims were staked out.

IDAHO.

A PROFITABLE CONCERN. — The De Lamar Mining Company of Idaho paid a quarterly dividend of 1s per share at the office in London on the 30th ult., equal to $100,000, and making $400,000 for the year.

IN NEZ PERCE COUNTY.—The Big Bar Mining Co. of Salmon river hegan piping last week. This company was organized in Nebraska and commenced work last April. A six-mile ditch was huilt and water was taken from Divide creek on the Idaho county side of Salmon river and brought across the river at Rock creek. To accomplish this an inch and an eighth steel cable was used, anchored to an iron stayholt on one side and to a douhle windlass on the other, the pipe heing suspended from the cahle by clamps. The distance across the river is 1000 feet; the pipe was 250 feet ahove the river; 1800 feet of pipe was necessary to carry the water across the river. Owing to the unusually dry season, there was not sufficient water to mine with when the plant was completed, hut the late rains have startcd the water, and now the company expects to run day and night.

MONTANA.

ACTIVITY IN BUTTE.—*Miner:* During the past week there has heen considerable activity among that class of miners locally known as "leasers." Many of those who are working properties at a profit are adding to their possessions, while others are endeavoring to get into the money-making swim. The whole tendency seems to he to get hold of copper properties, silver heing a secondary consideration. There are very few idle miners in town, and those who are out of work are mostly recent arrivals.

LOWER CALIFORNIA.

PENINSULA MINING.—There is more activity among mining men in the northern district of Lower California, says the *Union*, than has existed since the days when the Aurora mine at Alamo was turning out anywhere from $20,000 to $50,000 per month in bullion for its owners. That was ahout five years ago. Four years ago Alamo hegan to give out, and until a few months ago was considered a comparatively dead camp, with little hope of resurrection. A few old pioneers remained hehind to putter around their claims, but the more active element said good-bye to the deserted shafts and shanties and sought greener fields. Those who stuck to the town had great faith in its ultimate outcome, and they believed that if once the dikes which were confronted in the Aurora, Princesa and other deep mines penetrated, greater wealth would he found heneath.

There is every reason now, apparently, to believe that Alamo and the adjacent country will rapidly come to the front again. Maj. Russell is reliahly reported to have made arrangements in London with the owners of the Princesa to join with him in carrying the shafts of the Princesa and Aurora down several hundred feet farthcr, and the Englishmen have put $50,000 in the pot for this purpose. The two properties adjoin on the lower slopes of Princesa hill, and it is likely that if any great strike is made in either, the other will share in the honanza. This theory was not substantiated, however, in the old days, for while the Aurora was sending up bucket after bucket of white ore bespattered with yellow gold, and the end seemed afar off, the Princesa, under hetter management and with more ample facilities for digging in the granite depths, made a very poor showing. At the end of the south tunnel at the 100-foot level in the Princesa the men could plainly hear the drills at work in the rich rock of the Aurora, through the solid granite, hut the Princesa people could not strike the yellow streak nor find anything at all promising.

The Viznaga mine at Alamo, under the management of Davis and Russell, is down 160 feet with enough good ore in sight to keep them husy for a year. A stamp-mill is running, and bullion will soon he shipped.

The Jacalitos district is experiencing a small hoom. Two mines have heen sold since Corrales parted with his claim for $15,000 some weeks ago, and the camp is getting quite a reputation. Parties are outfitting at Ensenada for the mountains in that locality and before spring some good discoveries are expected to be made.

Coast Industrial Notes.

—California has shipped 9,000,000 gallons of wine this year. It sold for $3,500,000.

—The working hours in the Sacramento railroad shops have been reduced from nine to eight per day.

—By a vote of five to one, Nevada City authorizes issuance of $60,000 bonds for a new water system.

—A. J. Uphaus of Everett, Wash., is shipping 1,000,000 cedar blocks to Indianapolis, Ind., to be used for street paving.

A saving of about 25 per cent in tie renewals has been effected upon the Southern Pacific by the chemical treatment of ties.

With potatoes at 30 cents per 100-pound sack on the dock here, it looks as though a San Francisco starch factory ought to be a paying industry.

Exports of wine from San Francisco during the first nine months of the year were 11,082,412 gallons, against 9,888,800 gallons during the same time last year.

The exports of lumber from San Francisco for the first nine months of the year were 11 751,000 feet, against 12,563,000 feet during the same period in 1894.

Imports of specie at San Francisco during the first nine months of the year were $2,691,000, against $2,331,000 during the same period in 1894. Of this year's receipts Mexico sent us $1,418,838, or over half.

—The track-laying force on the San Francisco & San Joaquin Valley railroad goes on at the rate of half a mile a day. The tracklayers will have their work done to the Stanislaus river, twenty-four miles, about December 15th.

—At Fresno five carloads of copper wire arrived last Tuesday for the new electric power plant now building on the San Joaquin river. Poles are arriving and the pipe is on the way. Fresno expects by April 1st, '96, to equal the recent Sacramento electrical display.

—General Manager Dodge and Traffic Manager Babcock of the Rio Grande Western are represented as saying that that company has decided to resume building operations next spring and the road will be built to Los Angeles on the line originally surveyed.

—The Colton cannery packed 964,000 cans of fruit this season. A total of 940 tons of fruit was bought at an average price of $18 per ton. For labor there was paid out by the company $21,000. The average number of hands employed during the working season was 375.

—The Virginia, Nev., *Enterprise* says the immense deposit of gypsum near the Mound house is to be worked. This material will be mined and transported to the mill at the stone quarry on the river, where it will be ground into a condition fit for use for stucco work.

—Foreign imports at San Francisco during the first nine months of 1895 were $28,763,450, against $30,694,000 during the same time in 1894. Of this year's imports we received $6,296,000 from Japan, $6,479,000 from the Hawaiian Islands, $3,921,000 from China and $2,954,000 from Great Britain.

—The Pacific Coast Land and Water Company has discovered a bed of fine glass sand in the Los Angeles river. Tests made with the sand have been successful. The glass product is said to be of brilliant color and transparency, and glass experts say that the sand found is superior to any discovered so far on the coast.

—The $10,000,000 to be provided by the syndicate organized to underwrite the Union Pacific Railway reorganization plan is to be used to pay off the past due coupons on the underlying liens and also the coupons on the same liens during the coming two years. By this action the right will be secured to foreclose the first mortgage.

—For the year ending June 30, '95, the San Francisco assessor gives the following summary of statistics of manufactures for the year ending June 30, 1895, as compared with the previous year:

Total value of manufactures, '93-94.....	$62,399,500
Total value of manufactures, '94-95.....	58,808,410
Number of persons employed, '93-94	27,073
Number of persons employed, '94-95.....	28,798

—Exports of specie from San Francisco during the first nine months of 1895 were $21,065,635, against $22,682,154 during the same time in 1894. Of this year's shipments $8,363,000 went to Hongkong, $3,417,000 to Shanghai and $8,096,000 to New York. There was $6,402,000 shipped in silver bullion, $6,197,000 in Mexican dollars, $7,109,700 in gold coin and $1,084,200 in bonds and currency.

—The Union Pacific Railway is credited with immediate intention to start a service in connection with the Northwestern and Oregon Railway & Navigation Company, by which the time between Portland and Chicago will be shortened twelve hours. The present time is eighty-four hours. A like reduction in time from San Francisco to Chicago is in contemplation in connection with the Central Pacific.

—Jas. Yerington is going to open up that Elko, Nevada, natural soap mine. For years the local residents have used this soap. It is the purpose of an Eastern company to refine it—add glycerine or some other ingredient. Mr. Yerington says he thinks he could guarantee an output of 100 tons per day, with the supply practically inexhaustible. The analysis shows: Sand 5.55 per cent, clay 62.97 per cent, alkalies 14.87 per cent.

—The greatest foreclosure sale ever made will take place the 10th of next month, when the Atchison, Topeka & Santa Fe Railroad Company, with liabilities reaching the prodigious amount of $367,000,000, will be quietly and quickly sold to the highest and douhtless the only bidder, representing the united security holders. Reorganization under the now thoroughly perfected plan will immediately follow, and the new Atchison, Topeka & Santa Fe *Railway* Company, with lessened debt and reduced rate of fixed charges, will start on its hopeful career. As to who will be the head of the new company, rumors are conflicting; the *Railway Age* thinks it is safe to predict that the owners will not consider it necessary to go outside of the present organization to find a president.

—Dr. William C. Day, special agent of the Census Bureau, says: "Asphalt is now found in fifteen States, but only California, Kentucky, Texas and Utah make any commercial use of the deposits. Most of this asphalt is found as bituminous sandstone and limestone, the Utah gilsonite, or gum asphalt, being the purest and most valuable, selling at $35 per ton. But this expense is partly accounted for by the fact that it must be hauled nearly 100 miles to the nearest railway."

The *Post-Intelligencer* has compiled statistics of Washington lumber and shingle shipments by rail, as follows, for the nine months ended September 30. They show:

	1895.	1894.
Shingles.....	1,595,000,000	1,365,770,000
Shingles (carloads)	12,101	8,115
Lumber (carloads).....	4,889	3,397
Lumber (feet)	73,230,000	52,962,000

The lumber carload shipments in 1893 were 4687, and in 1892, 5255. The shingle shipments by carloads were 4125 and 4564, respectively.

—Two large drainage districts have been organized in Sutter county; work on the drainage canals in Live Oak district is in progress. This canal will be twenty-two miles long and toward the lower end is twenty feet wide on the bottom. It is paid for by assessments on the lands that will be benefited and will cost about $30,000. The number of acres drained is about 18,000. A second district west of the first is known as Snake River district and will drain from 20,000 to 30,000 acres. No work will probably be done on the canal in this district until next summer.

—Two new revenue cutters are to be built here. One, to be called the Golden Gate, will be for harbor duty at San Francisco, in place of the Hartley, and the other, a single screw composite propeller, for general service. The dimensions of the larger vessel are: Length over all, 219 feet; length between perpendiculars, 200 feet; breadth of beam molded, 32 feet 6 inches; extreme, 33 feet 4 inches; depth of hold from top of flat keels on plate to the top of the main deck beams amidships, 17 feet 10¼ inches; displacement to mean draft of 14 feet above bottom of keel, 1280 tons. The Golden Gate's principal dimensions are: Length over all, exclusive of fenders, 110 feet; length between perpendiculars, 100 feet; breadth of beam, molded, 20 feet 6 inches; depth, molded at mid-length between perpendiculars, 12 feet ½ inch.

—According to a Victoria, B. C., dispatch, prospects for the British Pacific railway, projected to cross British Columbia and the Northwest Territory a couple of hundred miles north of the Canadian Pacific, have brightened considerably through the visit of a representative of British capitalists, who, it is announced, have entered into a contract which will result in actual construction being commenced early next year. This will be conditional on the province of British Columbia and the city of Victoria giving certain assistance in the shape of guarantee of interest on bonds or otherwise. This having been in contemplation for years, it is understood will be granted without hesitation. The representative now at Victoria is Lafayette H. DeFriese of Steele, DeFriese & Dickson, New York and London. He has been in conference with R. P. Rithet, principal promoter of the road, with whom DeFriese and other representatives of capital will shortly hold further conferences in San Francisco.

—Surveys are being made for the new coast railroad between San Francisco and Santa Cruz. It is a broad-guage proposition. Chief Engineer Holmes says it will shorten the time between the two cities to two hours. He says the work of construction will begin by Jan. 1, '96. The cost is estimated at $2,500,000. C. M. Sanger, a mining man of Milwaukee, Wis., is the president of the company which is composed of Eastern men. On the route there are perpendicular cliffs 400 feet high, half of which will have to be blasted into the ocean. There are many ravines which will have to be trestled. The maximum grade will not exceed eighty feet to the mile. This is between Amesport and Laguna. From the last-named point to Santa Cruz the maximum grade will be thirty feet. Heavy cuts and fills will have to be made along the road. There will be three tunnels at Point San Pedro and one at Ocean View, 3400 feet long and 120 feet under the track of the Southern Pacific road. The San Francisco terminus will be at Twenty-first street and Potrero avenue.

—The paper mill at Stockton, recently closed, has lost close on to $200,000, which the owners have more than made up by adopting a different plan of manufacture elsewhere. When the mill was first established at Stockton it was because there was an inexhaustible supply of straw for the manufacture of coarse and cheap papers, but rags and straw are not now eagerly sought as paper stock. The price of many kinds of paper has been reduced one-half or more since the mill was planned, consequent upon the general use of wood pulp, which had taken the lead of all other paper stock. There was not enough good timber for pulp anywhere about Stockton. So the paper mill company hunted for a new location, and found it a point in Oregon, near Salem, where timber of the right kind was abundant, and there was an unfailing water power. At that point the company began to manufacture wood pulp and to manufacture paper. They have supplied the greater part of the newspapers on this coast, and have for some time been making regular shipments to Australia, underselling in that market English paper. The result is that the same paper company that sank two or three hundred thousand dollars in the mill at Stockton has made enough money in the new concern to balance all the losses and to have a considerable margin besides. The whole thing strikingly illustrates the rapid change in trade and manufacturing conditions.

—The Commissioner of the General Land Office at Olympia, Wash., has rendered a decision involving the ownership of agricultural and timber lands in the Gray's Harbor country north of Aberdeen, Wash., valued at over $1,000,000. On June 5, 1895, the Northern Pacific selected the lands in question, but prior to that date they had been settled upon by twenty-eight bona fide settlers. On June 28, 1895, the Olympia officers were instructed to notify these settlers that they would be allowed thirty days in which to enter the lands covered by their respective claims. All of the twenty-eight applicants failed to make entries as allowed, and John F. Soule and others made application to file upon the lands, the rights of the others having been forfeited. The railroad company claimed, as it had selected the lands prior to the application of the second list of settlers, it was entitled to the lands in the event of original applicants losing their rights. The Commissioner holds that the rights of the first applicants did not expire until July, and that the railroad's selection was prior to that date and did not hold.

—This is how the Clear Lake proposition looks to the New York *Tribune:* Clear lake, seventy-five miles north of San Francisco, and 1317 feet above the sea level, having its outlet in Cache creek, a stream supplying 327,000,000 gallons of water daily, is to have its forces translated into electricity, sent on overhead copper wires, 20,000 horse power and upward, to the motors at San Francisco, besides doing lots of useful work all around the region and on the line of transit. On the way, the waste water is to irrigate hundreds of thousands of acres of land, making it bud and blossom like the rose. The water will be shot through Pelton wheels, which will be connected directly with the dynamos, the latter being among the largest and most powerful known. The transmission of the electricity under the waters of the bay has been an intricate and difficult problem, but has found its solution, and now presents no obstacles of a serious character. Compared with the potentiality of Niagara, which is equipped to send abroad 700,000 horse power over its electric channels, the forces generated by the descending floods of Clear lake are not very great, but are enough to help along the industries of San Francisco greatly, besides those subordinate and various utilities on the way. California is taking a front rank in electrical enterprises, and has enough power stored up in her mountain lakes and streams to make her one of the greatest manufacturing and industrial regions in the world, at the same time promoting her fertility in an immeasurable degree.

Books Received.

"Practical Application of Dynamo-Electric Machinery," by McFadden & Ray, 168 pp. 12 mo.; a compilation of primary information on types of dynamos, motors, storage batteries, heating, etc.; published by Laird & Lee, Chicago, $1.

"The Gold Mines of the Rand;" a description of the mining industry of the Witwatersrand, South African republic: F. H. Hatch and A. J. Chalmers, London, Macmillan & Co., N. Y., 308 pp.; price $6. Considerable appears in the MINING AND SCIENTIFIC PRESS and other mining journals every week regarding the general progress of the extensive gold-mining operations in that part of the world of which this book treats, but nothing of the technical research and extensive detail offered by this volume. The geology of the gold and coal mines of the Rand is given great prominence. The coal product of that region has been a result of the great gold output, and is of course overshadowed by its auriferous neighbor. In '94 the principal collieries supplying the Witwatersrand produced 501,422 tons of coal, of which 447,000 tons were used in the mines. Incidentally considerable prominence is given the "boom" features of that gold district, but that is only natural, and the chapters on ways and means of mining, styles of surface equipments, ore treatment, modes of living, wages paid, cost of supplies, etc., will be interesting to many California miners. In general, the whole practice there is based upon and modeled after California custom and experience, modified somewhat by local requirements. Deep levels and the future of that region receive considerable attention, prophecy being indulged in to the extent of predicating an ultimate annual output of $100,000,000 for an indefinite period. Typographically the book is a credit to the publishers, the section plates, maps and drawings adding to its utility as a medium of information regarding that very interesting region.

"Contractors' Methods Employed on the Great Chicago Drainage Canal," 72 pages, illustrated with 44 half-tone engravings, many of them occupying a full page and showing views taken along the drainage canal. These illustrations tell a story in themselves, which will be of much interest and practical value to contractors. Half of the book is devoted to a description of a traveling cableway used on the canal in the course of its construction. The description of this, as well as the other devices employed, is clear and concise, all facts and figures relative to capacities and cost being obtained from contractors and engineers in charge. The cableway is able to handle 600 cubic yards of rock in place per day. As a yard represents about two tons on the drainage canal, this shows a capacity of 1200 tons per day of ten hours, the material hoisted from the canal 35 feet deep and delivered on the spoil bank 700 feet distant. The result obtained by the use of cars in carrying material from an excavation and that of the cableway in handling the same material is given from actual work done on the canal. It is stated that laborers in sledging and filling carts averaged from six to seven cubic yards per man, per day, while in filling skips on the cableway the average was from twelve to seventeen cubic yards per man per day. The book also describes an inclined car system for handling material, and a steel and rubber belt conveyor for handling earth; also steam shovels and dredges of various kinds which were used principally on earth sections. The pamphlet on the Great Chicago Drainage Canal is published for gratuitous distribution, and copies may be obtained by addressing the Lidgerwood Manufacturing Company at New York, Chicago or Boston.

"Journal of the Association of Engineering Societies," Sept. Since the accession of the Technical Society of the Pacific Coast to the general association of such societies, the papers read at the Technical Society's monthly meetings, and the discussion thereon, receive some publicity in the journal of the association. The issue to hand contains a handsomely illustrated publication of a recent paper read before the society by John D. Isaacs on "Stopping a Troublesome Slide at Summit Tunnel," descriptive of a successful effort to overcome a difficulty of that nature near Wrights, on the Santa Cruz division of the S. P. road, by raising the beds of Los Gatos creek and its tributary, and constructing a concrete masonry retaining wall from two of the points pierced by the longer of the two tunnels at that point.

Personal.

LOUIS JANIN is this week visiting mines in New Mexico.

TAYLOR & WARD succeed to the assaying business of the late C. A. Luckhardt.

GEO. JOHNSTON, of the Risdon Iron Works, has returned from a visit to Butte, Montana.

A. H. CARLYLE has been appointed Provincial Mineralogist by the British Columbia Government.

DR. DRAKE, of Sonora, is negotiating some important Tuolumne Co. mining transfers this week.

WM. R. THOMAS, formerly of Grass Valley, is now superintendent Central Eureka mine, Amador county.

GEO. OBENAUER has gone to Victoria, B. C., to take charge of the branch works of the Giant Powder Co. there.

AFTER twenty-nine years continuous work, T. B. Covey retires from the superintendency of the Oregon Improvement Co.

H. W. CARR has succeeded Jones & Carr, Redding, Cal., and will continue the business of the Redding Machine Works.

CARL HESSE who has been appointed manager of a Westralian mine, leaves this week via New York for his new field of labor.

WILBUR LONG is now superintendent of the Star mine on the south fork of the Stanislaus. A new 10-stamp mill will be in operation there by Jan. 1st, '96.

O. S. CRESSLY has returned from Providence, R. I., and is taking an active interest in the development of valuable mining property in Tuolumne county.

JAS. HOATSON has resigned the superintendency of mines of the Butte and Boston. J. M. Merrill, the company's outside superintendent, has also resigned.

W. T ST. AUBURN, formerly of the Niagara mine, Shasta Co., is now superintending the operations of the Lo Magunda Development Co., at Salisbury, Rhodesia, South Africa.

G. W. PRESCOTT is succeeded as superintendent of the mechanical department of the Southern California railroad by C. F. Lane, formerly master mechanic of the Wabash road.

T. T. LANE'S resignation as superintendent of the Utica mine has not been accepted, arrangements having been made to allow him to devote some of his time to the Jenny Lind mine, in which he is considerably interested.

DR. W. E. EVERETTE, of Tacoma, who represented the Northwestern Mining Association at the annual convention of the Cal. Miners' Association in this city, has made a report to his association which elicits cordial response.

HORACE F. BROWN of Chicago, consulting and mining engineer, has gone to Cape Breton, Nova Scotia, to arrange for preliminary plans for a complete copper plant for the Eastern Development Company of Boston at their copper mines in Cape Breton.

J. J. KARMEEN has assumed the superintendency of the Dunderberg mine, Bridgeport, Mono Co. This mine has not been worked since 1872. Two-thirds of the stock is owned by the Mines Exploitation Syndicate, Ltd., of London. Mr. K. owns the remainder.

OTHER than California miners have found fame and fortune in South African gold fields. P. J. Triggs, a Montana miner, has made half a million in lucky investments; H. A. McMillan and M. Sullivan, of Anaconda, Montana, have responsible positions; V. M. Clements, formerly of Wardner, Idaho, is general manager of the Gold Fields Mining Co., and manages to exist on a salary of $30,000 a year.

H. W. WEST, a graduate of the California University, now manager of South African mining property for Cecil Rhodes, recently wired Thos. Price of this city for a competent man to take charge of some mining operations in Mashonaland. In response, J. H. Tibbitts sailed for New York this week. His annual salary is $8000. With him goes Malcolm McCallum, another Amador county miner and timberman.

Scientific Progress.

A Great Work Accomplished.

Last week saw the close of a task taken up by the U. S. Coast aud Geodetic Survey tweuty-four years ago, and steadily prosecuted to a successful terminatiou. It is the surveying of an arc line from Cape May in southeastern New Jersey on the Atlantic coast to Point Arena in this State on the Pacific, the greatest work of the kind in the world's history. The last work was done on the summit of Uncompahgre peak in southwestern Colorado, the highest mountain in the contineutal range of the Rocky mountains within the national boundaries.

The parallel describes an arc across the American continent, the westeru terminus at Point Arena on the Pacific coast, and the eastern at the lighthouse at Cape May, overlooking the Atlantic ocean. The line was run by the method of triangulation, the main theater of operations being between the crest of the Sierras and the eastern rim of the Rocky-Mountain range, from Mount Diablo to Pike's peak. On the latter peak the two divisions of the geodesians met early this summer, the one with the line from the risiug of the sun, across woodlands and prairie, and the other from the setting of the sun, across mountain, canyon and mesa. On Pipe's peak the Government's engineers compared notes and welded the two lines together, though the tying of the knot was really accomplished later on Uncompahgre. Strong and durable monuments have been built at points along the line in the West, and the mountain work, which is pronounced superior to anything of its kind, covered a wild and rugged scope of country 800 miles long, east and west, as a crow would fly. The line runs exactly one mile south of Treasury mountain, near Crested Butte, in Colorado, one mile south of Mount Como, in Nevada, and, as the imaginary line in school geographies will show, through Lake Tahoe. Jeff Davis mountain is just three-quarters of a mile south of the line.

The determining of the exact longitude and latitude of these and other mountains is to assist in the geographizing of the country, and is for perpetual effect. The only actual measuremeuts made were an occasional base line, one of them being in the Bonneville hasin, near Ogden, Utah. Aside from these the work was accomplished hy observations and trigonometrical calculations through the aid of the theodolite or altazimuth, mercurial barometer, chronograph and auxiliary pendulum, heliotrope and hygrometer.

The party comprised two divisions, the engineers or geodesians, and the preparatory party. The latter built the trails to the summits and erected the tents, brought up the supplies and kept open communication with the postoffice and railroad station. The camp built on Uncompahgre was a model one. A new trail was constructed from the hase of the peak and all equipments, with the exception of the theodolite, were packed up the mountain on mules' backs. The theodolite, in its case, weighing 200 pounds, was slung on two teut poles and carried five and a half miles up the steep trail hy relays of two men each. All the liviug tents, canvas and observatories were protected from the strong west wind hy walls of rock four feet high, and were also securely anchored to stroug posts set in piles of rock. The preparatory party looked after the transportation of the instruments and equipment from one station to another.

New statious have been made every summer since the work began on various high peaks in the Califoruia system of mountain ranges, in the Sierra Nevadas and the Rocky mountain system. The stations were each occupied by the geodesians for a greater or lesser time in each season until from each a due number of observations had been made. The geodesians moved eastward on either side of the imaginary line of the thirty-ninth parallel, tying it definitely to some peak or natural monument, and selecting the most eligible peaks for sighting.

The preparatory party preceded the geodesians from point to point, but on Pike's peak their services were not required, the cog-road furnishing means of ascent, and the fixed observatories on the top giving the necessary accommodatious and shelter. In the transfer from Pike's peak to Uucompahgre most of the paraphernalia, including stoves, cooking utensils and bedding, was sent to Lake City, in Hinsdale county, hy registered United States mail, and amounted to 3500 pounds in fifty packages, each with an 8-cent Columbian postage stamp thereon. It went through in the time of an ordinary registered letter. The preparatory's outfit included wagons, horses, and a pack-train of mules. One sedate old jack, starting out from Sacramento eighteen years ago, has been "hitting the high places" ever siuce, and this fall leaves the service of the Government hy heing sold at auction to the highest bidder.

Fuel had to be packed ou mules to the summit from timher line, and water was also carried up in casks in canvas slings.

Uncompahgre, where this thirty-ninth parallel of north latitude across the continent was finally determined, is a noted mountain among national surveys and Government expeditions, and has repeatedly been the station for geological surveys, heliograph signal experiments and exploring expeditious. Hayden's party occupied it during the field of investigation from 1873 to 1876. They placed its altitude at 14,235. Other estimates put it at 14,540, and an average of a large number has placed it at 14,510. The barometrical ohservations made this summer indicate its altitude to he considerahly more than the average of all those of the past. Uncompahgre is in high favor with the geodesians, because of its easy access, and the roomy summit, which is nearly five acres in extent, with a gentle incline. The humidity of the atmosphere in Colorado enabled them to live in the high altitudes with comparative comfort against life in similar elevations elsewhere. On the coast peaks the geodetes experienced a difference of 25° in dry and wet barometers. On Jeff Davis mountain the thermometer often stood helow zero. The thermometer recorded 19½° helow once when the geodetes were operating. It did so in clear blue sky, with the sun shining hrightly and to all appearances it was like a balmy May morning—there was no chill—but ere the geodete knew it the tip of his nose was frozen, his ears were frost-hitten and the only way he knew that it was a very cold day was by looking at the thermometer.

That which gave the geodetes the most personal concern was the lightning, but after experiencing several shocks they got comparatively used to it. In the last two years the lightning has been perceptibly more frequent than in former years. The pack mules showed an aversion to the element. As soon as they felt an electrical storm coming on they shook their heads and ears and left the summits.

The geodesians proper did not have the lonesome time that the heliotropers had. The former were half a dozen or more on some one peak, and able to he sociable, but the heliotropers were stationed in couples or singles at isolated peaks, and the daily routine was monotonous.

Chief Eimbeck has for nearly a quarter of a century lived above timber line, with an occasioual trip to Washingtou. When asked how life at extreme high altitudes affected a person he said he did not kuow, except that it was hard on a man. His hair was turned white, though he is yet in his prime, aud he has grown portly. He feels that he has been out of the world.

Life on the high peaks has been uneventful, devoid of thrilling iucidents, and often the greater portion of the nights were whiled away in making endless computations and calculations on paper by the light of paraffine candles.

There are some odd ends of work yet to he done, such as making a tie-to to the University Ohservatory and running another base line in Utah, and then the geodesians will seek other walks in life, having completed, without any noise or ado, a task of unusual scientific and world-wide interest.

Mechanical Progress.

Thirty Knots an Hour.

The armored cruisers Columbia and Minneapolis are capable of a speed of 23 knots an hour under favorable conditions. There are a very few smaller craft, uotahly torpedo-boat catchers, which can do hetter than this. The Havock, Hornet and Ferret have made several single mile runs at a speed of about 27 knots. The first named boat showed an average of 26.18 on her trial trip; the second 27.31 (with a spurt at 28.48), and the third 27.61, in six single-mile runs, the best of the lot heing at the rate of 28.346. The Sokol, a vessel just completed for the Russian Government has developed an average speed of 29.773 in six miles, and in three of them 30.102. This is the first official record of thirty knots anywhere in the world.

The Sokol differs but little from the other three boats just named in dimeusions and engine power. The Havock and Hornet are twins, with a length of 180 feet, and a tonnage of about 220. On her trial trip the Hornet carried 169 pounds of steam, and developed an indicated horse power of about 4000. Her engines made 388 revolutions a minute. The Ferret is 194 feet long and has a five-foot draught and the same tonnage as the other two crafts. Her mean steam pressure on her trial trip was 172 pounds, her engines made 363 revolutions and her indicated horse power averaged 4507. The Sokol is 190 feet long, and developed ahout 3700 horse power, with 160 pounds of steam and 405 revolutions, according to the United Service Gazette, London.

The Russian's hull is a little more finely moulded than those of the British torpedo-hoat destroyer, but the gain in speed is attributed not so much to the model or any other one cause as to a general improvement in many details of the propelling machinery. The hoat is huilt mainly of nickel-steel, although aluminum is employed, in order to save in weight where great strength is not especially required.

To M. Normand of Havre, France, belongs the credit of constructing the fastest boat that ever floated. Iu an official trial at Cherbourg last month the twin-screw torpedo hoat destroyer Forban, built hy M. Normand, attained an average speed of 31.029 knots.

Copper Strong as Steel.

The *Railroad Gazette* says announcement is made at frequent intervals of discoveries in the treatment of copper, usually in tempering it, and the discreet part of the world has long heen pretty shy of such claims. A Chicago man has, however, succeeded in obtaining results which appear to warrant further attentiou. He says that he has discovered a new process of treating copper, whereby castings are produced of a very superior quality and free from hlowholes. What is done to the copper to secure these results is not stated, but the effect of the treatment is to produce a metal that flows freely in casting and leaves very little trace in the crucihle. The castings are solid, smooth and free from blowholes, and show a fiue granular fracture when broken. The treated metal can be produced of different degrees of hardness, and is capable of being rolled into thin sheets or drawn into fine wire when cold without annealing.

The Illinois Central railroad shops have made some tests of this treated metal to determine its action while heing worked iu the machine shop. During the operation of planing, boring and turning it behaved much like steel, though slightly easier to cut.

During the past year the Worth Manufacturing Company, now of Benton Harbor, Mich., has been making the connecting rods of their gasoline engines of treated cast copper. They are used upon engines running at as high a speed as 600 revolutions per minute, and are not only cheaper than the old form of steel rod, but very satisfactory. No trouble has arisen from the treated copper hearings.

Tests made at the Washington navy yard show the treated copper to he pure, and, on a test bar 14 inches long and 1 inch on the faces, showed an elongation of 3¾ inches and an ultimate hreaking strength of 37,800 pounds. Other tests made in Chicago show the ultimate breaking strength to be hetween 36,000 and 38,000 pounds. The ultimate strength of ordinary cast copper is 24,781 pounds.

It is claimed that no alloy is used in the process of treating, and that the process is not expensive, and can he applied to a quantity of copper necessary to make the largest castings. The treated metal can be worked successfully with the planer, lathe, dies and rolls, or can be drawn into wire. The metal is considered by the makers superior to any other for hearings for heavy engines, locomotives and cars.

Acids in lubricating oils may he detected by putting the sample to he tested in clear glass hottles with a copper wire running down through the cork, air tight. Stand the bottles in a sunny place and leave for two or three weeks. If on removal verdigris or greeu rust is on the copper, there is an acid in the oil.

German papers assert that gas pipes made of paper are a success. Manila paper strips are passed through molten asphaltum and then moulded under heavy pressure. After cooling, the pipes, which may be of any desired length, receive a water-proof coatiug.

Electrical Progress.

The Electric Wheel.

If multitudinous patents and numerous improvements go for anything, the road electric cycling machine will soon be au accomplished fact. Oue electric tricycle, "built for durability, comfort and every-day business and pleasure use," weighs complete, without motor or batteries, 47 pounds; with motor and batteries, 160 pounds. The machine is designed for a maximum load of 500 pounds, riders and baggage. The battery case and motor are spring mounted, and the seat is of leather, hammock style. Another electric tricycle is peculiar in having the forward wheel as the driving wheel. The current is obtained from two cabinets of battery, each 24x8x8 inches, which are fixed on either side of the driving wheel. Their weight is 100 pounds. The carriage part of the vehicle is a light structure consisting of a simple framework, with a wide comfortable seat and two pneumatic tired wheels hung in ball bearings. Each wheel is independently journaled, so that all extra frictiou on curves is avoided. The peculiar feature of this tricycle is that the front wheel, being the driving wheel, and carrving within itself the entire locomotive force, is practically a mechanical horse. It can be detached from one vehicle and hitched on to another in one minute, and will work as well in front of a sleigh as when drawing a carriage. It is claimed that one filling of the cells will ruu the vehicle from 100 to 150 miles, according to the coudition of the roads and the load carried. Enough of the concentrated hattery solution may be carried for a 500-mile run. In England, a tricycle propelled by a tiny petroleum motor is beiug used. Its weight is under ninety pounds. The petroleum vapor is ignited by an electric spark. In order to set the machine in motion, the rider admits the petroleum hy turning a tap, which at the same time

turns on the electric current. In mounting a hill the rider can assist the speed by gearing up the pedals and using the feet, thus adding animal power to that of the motor. The latest form of electric bicycle is now running in the streets of New York. It weighs, with its electrical equipment, sixty-four pounds, and carrying fifteen pounds for twenty-four hours at the rate of thirty miles an hour. The power is derived from a storage battery placed under the saddle which is connected with a small motor geared to the rear wheel. The current is controlled by push buttons near the handle bars. A powerful electric lamp and an electric buzzer to warn pedestrians complete the equipment.

The Inverted Arc Lamp.

The electric arc lamp has already been open to the objection that it casts dark shadows. Its illumination is not diffused enough for many of the purposes for which light is needed indoors. The experiment has been tried in several factories on both sides of the Atlantic during the last year or two of throwing the rays upward first, and reflecting them from a clean white ceiling. The results thereby attained satisfy those who made the tests that the new plan is a distinct improvement upon the old one for certain establishment, and a special inverted arc is being manufactured for the trade. The reflector surrounding the arc opens upward instead of downward, and the mechanism for feeding the carbon pencil as it consumes is arranged below instead of above the arc. The direction of the current is reversed, too, so as to make the lower carbon the positive pole. Even without a reflector over it, the ordinary arc lamp throws more light downward than upward, because the extremity of the upper carbon at the gap is more luminous than that of the lower one. But by causing the current to flow in the opposite direction the lower tip is made to glow more intensely, and hence the proportion of the total radiance thrown upward.

Electricity to Displace Steam.

A dispatch from Chicago says: Within the next year the Illinois Central and the Chicago and Northern Railroads, both of which are now operated by steam, will be run by electricity. It is possible that the latter road will use electricity on its entire system, while the Illinois Central will begin with its suburban service only. Already the official call for a special meeting of the Illinois Central stockholders to ratify this decision has gone forth. That meeting will be held in this city on November 26th. At that time the stockholders will be asked to increase the capital stock of the company from $50,000,000 to $60,000,000, one-half of this increase to be spent in and around Chicago, the other half to be used in the extension of the Southern system. Bids have already been secured from builders of electrical appliances for the complete equipment of the system. It is estimated that the entire cost will be from $3,000,000 to $4,000,000. This will include the substitution of electricity for steam as the motive power in the company's car shops at Burnside.

NEW apparatus designed to bleach cotton cloth by means of electricity is briefly described in late foreign periodicals. Two horizontal rollers, one made of iron and the other of carbon, are employed in such a way as to serve as electrodes, being properly connected with a battery or dynamo, and the two lying very close to each other. The cotton cloth, before passing between them, is soaked in salt water. The electric current, passing from the one roller to the other, disintegrates the salt, and the chlorine accumulates in the goods. The other element, freed by electrolysis, sodium combines with the water instantly to produce caustic soda, which is taken up by an endless felt blanket running over the iron roller and out through a water tank. After becoming impregnated with chlorine the cloth is rolled up and allowed to stand long enough to allow the bleaching agent to complete its work. It is intended to equip the machine with several sets of such rollers as are here described.

A Talk Meter Wanted.

The man who wishes to take a short cut to fame and fortune has now the chance of his life before him. The crying need in the telephone business is a talk meter, an automatic arrangement by which language can be measured off and recorded in specific lengths. The telephone exchange people say that the garrulity of some of their subscribers is appalling, and that the trouble is not confined to one sex. The sound of their voices in the telephone transmitter has for some people a great fascination, and they will be ringing up "Central" all day if they can find the most trival pretext. The telephone companies say that in this way a large amount of work is unduly thrown on the exchange employes. They hold that the fault is with the system, and that if people could be made to pay according to the number and length of calls, they would make more temperate and legitimate use of the instrument. Philadelphia is approaching the idea. The Bell Telephone Company there gives what is called measured service, the "measurement" being determined by the number of calls or connections, each five minutes' conversation or fraction thereof being counted a call. This gives subscribers rates in proportion to the use of their instruments. Some such method as this will have to come into general use if the abuse of the telephone is to be arrested. Seven hundred and fifty million telephone messages were sent over the wires last year, averaging about ten messages to every man, woman and child in the United States. Telegrams never exceeded one per head per year.

IF a fine alumiuum wire is traversed by an electric current sufficiently intense to heat it beyond its point of fusion, it may be heated to a dazzling white heat and remain in this condition. This is quite contrary to what happens with other metals subjected to the same test, which, when their point of fusion is reached, break suddenly, each broken end presenting the form of a little metallic globule, produced by the contraction due to the superficial tension of the liquefied metal.

ELECTRIC current for lighting and power is to be transmitted to Seattle from a distance, if plans on foot are carried out. Two dams to raise the levels of natural lakes are projected, together with a pipe line from one of these to a power house, "from which an eleven-mile wire would run to Seattle."

THE Nevada City *Transcript* says the Electric Power Company has now received all the machinery it will require for generating 1000 horse power. Preparations have been made for increasing the plant to 3000 horse power whenever the business will justify it.

Practical Information.

Overathleticism.

The body can be killed through one organ, and in youth and middle age mortal injury of body and mind comes usually through one organ as the primary seat of evil. It is an evil of frequent occurrence and greatly on the increase. A man is said to "throw himself, heart and soul, into his work." Such a man is in danger. He has four great parts of his body to consider—his heart and blood system, his lungs and other organs associated with breathing, his muscles, his brain and nervous system. But he does not head them at all. He runs or cycles excessively, and in a much shorter time than he has the least idea of he makes his heart too strong for the rest of his organism and endangers the finer ramifications of the vessels which are under the domination of the heart. He rows without studying consequences, and long before he is convinced of trouble he has produced an injury of the chest mechanism which may soon be permanently established.

He takes to some muscular training, which puts the muscular organs to an extreme of tension. Large and small muscles alike are exposed to strain, both the strong muscles that give propulsion and the delicate muscles that guide, and before he has become conscious of the error he has committed he is a strained man, from which predicament he is fortunate if he make anything like a complete recovery. Another man enters into competitions in which his mental organs are kept awake for long intervals, charged with expectations, anxieties, fears, nay, excess of satisfaction, and while he is yet young he grows old.

Wages Paid at the Chicago Drainage Canal.

The biggest work now going on in the United States is the construction of the immense canal from Chicago on Lake Michigan to the Illinois river; over 8000 men are employed. All but a comparatively small number are paid by the day, the average wages running as follows:

	Per Day.
Laborers	$1 50
Teamsters	1 50
Drillers	1 75
Train men	1 75
Channelers	2 50
Blacksmiths	2 50
Machinists	2 00
Carpenters	2 00
Stone masons	3 50
Firemen	1 75
First levermen	2 50
Second levermen	1 50
First hookers	1 75
Second hookers	1 50
Riggers	2 25
Cableway repairers	2 25
Boilermakers	3 50

The salaries of the men employed by the month are as follows:

	Per Month.
Superintendents	$100 to $150
Timekeepers	50 to 75
Bookkeepers	60 to 125
Foremen	60 to 80
Pumpmen	50 to 80
Electricians	75 to 90
Civil engineers	90 to 100
Steam shovel engineers	125
Steam shovel cranemen	90 to 100

During the summer months of 1895, about 8700 men were employed, of which 1700 or 19½ per cent earned $2 per day or more; and 7000 or 80½ per cent earned from $1.50 to $1.75 per ten hours; for shifts longer than ten hours, the men are usually paid pro rata for the extra time. Board is $4.50 per week.

Future Inland Waterways.

It would not be a wild prediction to say that persons now living may read of a vessel leaving Liverpool, passing through New York harbor, up the Hudson river, through a canal to Lake Erie, thence by Lake Michigan to Chicago, down the Chicago canal into the Mississippi, thence up the Mississippi into the Missouri, up that and thence by canal to the Columbia river and down that into the Pacific ocean, and thence back by way of the Suez canal, thus circumnavigating the globe and crossing the North American continent. The distance between the headwaters of the Missouri river and the Columbia is about 400 miles, and it is said that a canal connecting them is practical. It is not likely that such a sailing feat may ever be witnessed, but it is possible. It is not likely that the Columbia and Missouri will ever be linked, but there is nothing visionary in the linking of the lakes, nor in connecting them with such rivers as the Hudson, Ohio and Mississippi.

Comparative Value of Foods.

Prof. Atwater's exhaustive studies and experiments in this line have led him to the conclusion that the greatest nutritive value in any kind of food of the same specific cost is to be found in cornmeal. He finds that in 10 pounds of the latter there are slightly over 8 pounds of actual nutriment; in 8¾ pounds of wheat flour there are over 6¾ pounds of nutriment; in 5 pounds of white sugar there are 4½ pounds of nutriment; in 5 pounds of beans there are 4 pounds of nutriment; in 20 pounds of potatoes there are 3¾ pounds of nutriment; in 25 cents' worth of fat salt pork there are 3½ pounds of nutriment; in the same value of wheat bread there are 2¼ pounds; in the neck of beef, 1¾ pounds; in skimmed-milk cheese, the same as the latter; in whole-milk cheese, a trifle more than 1½ pound; in butter, 1½ pound; in smoked ham and leg of mutton, about the same; in eggs at 25 cents a dozen, about 7 ounces; and in oysters at 35 cents a quart, about 3 ounces.

A MEXICAN lumber dealer, interviewed by the *Timberman* on the subject of Mexican logging and lumbering, says all the logging is done by hand. Indian labor is employed very largely, although considerable Mexican help is required. He says it is rather an interesting sight to see a dozen or more Indians roll the logs a distance of half a mile to the mills. He states that Indian or Mexican labor, or peon labor, is similar to the old slave labor in the Southern States. If a man runs away after you hire him the law brings him back. The men are paid an equivalent to 18 cents a day in American money. Some of them are hired by the month, at $6 per month and found. The word "found" means to supply the laborers with a bushel of corn and a peck of beans each per month, in addition to the $6. The principal manufactures there are of cottonwood, Spanish cedar, mahogany and musket.

Hydraulic Mine for Sale.

Not on a navigable stream; in northern California. Good dump; no trouble with tailings; 180 acres of mining ground; 5000 inches of water. Can work eight months in the year. Ample opportunity given a buyer to fully test the property before payment is made. For further details,

Address X, 2022 W St., Sacramento, Cal.

THE

LIXIVIATION OF SILVER ORES

WITH HYPOSULPHITE SOLUTIONS.

By CARL A. STETEFELDT.

Second Edition. Completely Revised.

Published and Sold by the Author,

967 Alice Street.....Oakland, California.

PRICE, BOUND IN CLOTH. $5.00

ANGELS IRON WORKS,

DEMAREST & FULLEN, Props.

Mining Machinery.

ANGELS, CAL.

Write for estimates on complete Milling, Mining and Reduction Plants.

WANTED!

A PRACTICAL PLACER MINER,

Capable of taking charge of hydraulic plant.

Address, stating salary expected, TEMPLE BAR, Kingman, Arizona.

FOR SALE!

120 Acres in San Diego County,

With one ledge 4 feet quartz and two cross ledges 2 feet; extensions of well known mines. Inquire 1523 Stockton St., San Francisco.

F. A. HUNTINGTON'S NEW IMPROVED
Centrifugal Roller Quartz Mill.

This Improved Mill has the following advantages over my Geared Mills, viz:
1st.—I dispense with the wooden frame with posts and set the mill on heavy timbers or a concrete foundation, thereby securing a solidity that cannot be attained when set on posts.
2d.—I dispense with gearing and drive direct from the pulley.
3d.—There are five less places to oil.
4th.—The Mill is built much heavier and stronger than the former ones.
5th.—Being heavier and set on a solid foundation, it can be run much faster, thereby increasing its crushing capacity in the same proportion as centrifugal force is increased by increased velocity.

Manufactured by F. A. HUNTINGTON,
143 First Street, San Francisco, Cal.

GATES ROCK AND ORE BREAKER

OVER 3000 IN USE THROUGHOUT THE WORLD.
PRODUCES A MORE PERFECT CUBIFORM MATERIAL AND A GREATER QUANTITY IN A GIVEN TIME PER HORSE POWER USED THAN ANY OTHER CRUSHER ON EARTH.
CAPACITIES UP TO 150 TONS PER HOUR. NINE DIFFERENT SIZES.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

BY USING

THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

Coal Gas, ten hours' run, 1000 feet	$2 00
Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c	1 25
Coal Oil, ten hours' run, 7½ gallons @ 10c	75
Crude Petroleum, asphaltum base, 16 gallons @ 3c	48
Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c	65

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

A REVOLUTION IN ORE PULVERIZING.

THE

Merralls Hydraulic Quartz Mill,

The Greatest Ore and Rock Pulverizer in the World, Either Wet or Dry.

THE ONLY MILL BUILT THAT RIVALS STAMPS. Our six-foot mill (No. 1) will reduce more ore or rock to pulp than a ten-stamp mill, with less than one-half the power and less than one-half the wear and tear, besides saving a much larger per cent of the gold in the ore.

This mill will reduce from 25 to 500 per cent more ore than any other rotary mill in use. Cheap, simple and economical. Four sizes built—from 15 to 250 tons capacity.

Send for Circular. Address

45 & 47 Fremont Street ..... San Francisco, Cal.

Market Reports.

The Markets.

SAN FRANCISCO, Oct. 31. 1895.

The general belief in better times has been discounted in some quarters, to the effect that buyers think they may do better by waiting. This applies mostly to the iron and steel business. The rest of the metals show continuous life and on all sides great activity is reported. Silver's see-saw puts it at about the same relative figures as the previous week.

Contracts covering the output of bar silver for some months in the future extend from China and Japan, by way of London, New York and Denver, the principal American producers of silver ore. The steadiness of the silver quotations indicates the existence of far-reaching contracts and of an endless chain which unites the nations of the East with the mines of the West.

London, as the financial center of the world, is the head. The corner, by the way, was many times proposed between 1887 and 1893, but never carried out. The projectors were willing and urgent, but the rapid increase in supply, together with the fear of adverse legislation, kept the moneyed men out. Now the conditions are different. The falling off in the world's silver product this year is noticeable. In 1892 the highest figure of the United States' production was reached, 63,500,000 ounces.

Add to the decline in production the small stocks of bar silver in London and New York and the steady shipments from San Francisco to China and Japan, and it would seem that the conditions are favorable for a steady advance. This advance will not mean a great deal to a number of the larger mines while present contracts with the smelters hold good, but it will have the effect of raising prices when new contracts are proposed and of opening up a large number of properties that are at present idle.

Harrison's coal circular says: During the week there were eight arrivals from the coast collieries with 18,119 tons, and 7323 tons from foreign sources. There is nothing special to note during the week, business in this line being particularly quiet. The prospects of early rains are inducing some housekeepers to see that their fuel bins are being replenished, although it is generally believed that there will be no advance of values during the winter months. The market is well supplied with all grades for steam and domestic uses—in fact, the want of yard room caused some recent arrivals of foreign coals to be disposed of at a material loss to the importer. Recent cabled advices report a very strong freight market for coal carriers from England to Australia. Cumberland coal bas been advanced $2.50 per ton this week. Harmouy again prevails among the Baltimore shippers.

Mining Share Market.

SAN FRANCISCO, October 31, 1895.

The market has continued to hang around; a few cents up and a few cents down. This has been its characterizing feature for over eight weeks, which makes it hard for an outside person to turn an houest penny so as to bring in a profit at another's expense. Why the market has been and is still kept in this condition it is difficult to say. There are various theories regarding it, one of which is that the manipulators are trying to get in all the shares possible, so as to make a small deal; another is that they are not prepared to commence an active campaigu until further work is done in the mines, so they can tell where they are; and still another is that they are keeping the market down so as to let the different compauies use up the money on hand and then levy assessments. Tbeories are more or less correct, but experience has taught that in the end they prove to be false beacons when using them as a guide in the share market. This, no doubt, is due to the fact that the manipulation of mining shares is a busiuess peculiar to itself, and cannot be gauged by that of any other. While saying this it cannot be denied that movements, so far, are in line with those which preceded former deals; but whether the same results will follow now it is hard to say. It is an open secret that such men as Col. Alvinza Hayward and John W. Mackay will uot back any move calculated to promote high prices unless the mines show one or more large-sized ore deposits, on which an upward move can he maintained successfully; but there are others always ready to attempt such a feat. It is maintained by many in position to know that in making the upward move of a few months ago those who manipulated the market had more shares thrown at them tban they cared to haudle at the higher figures. Since then they have taken in a large line of shares at lower figures, and are preparing for another bull move. Whether they will succeed this time in unloading at a good profit remains to be seen. It is not at all probable that many dealers will be badly hurt, financially, in trying to get even or make a profit.

The news from the Comstock mines contiuues confirmatory of active developing and exploiting work being done. In the Alta group it is of quite an encouraging character, which causes many of the more experienced miners to look with favor in that direction.

In the Gold Hill group the developing work is further advanced than in any other group. The ore lately found in Confidence is being run for in several of the mines at that end, including Seg. Belcher, Belcher, Crown Point, Kentuck, Yellow Jacket, Con. Imperial and Alpha.

In two of the above the west lode is liable to be struck at any time after next week unless it dips more to the west than had been expected. In the middle group the work grows in iuterest, although, as yet, there is nothing in sight to warrant dealers in shares to operate for anything beyond a slight turn on reports of improvements. These improvements are liable to be only for a day and again give out. So far as official letters go—and they are the only advices which deserve attention—they are following stringers and veins with the hope of one or more leading up to a big ore deposit. In doing this some ore is extracted, which helps to pay expenses.

In Gould & Curry and Best & Belcher the work is essentially unchanged from that reported last week.

The Con. Virginia management is pushing work with considerable vigor so as to determine if a large deposit of ore can be found.

In Ophir and Mexican the work to the west is about the same as given last week. It points to time before results can be determined. The same remarks apply to Union and Sierra Nevada. In Andes favorable work is under way.

From the outside mines no news of importance is allowed to leak out. It is claimed that quite important work is being done in the Bodie district; still it may take time to see if it will develop favorably.

Work on the Brunswick lode ought to attract more attention soon. Cross drifts (called on the Comstock crosscuts) have been commenced under favorable circumstances. It is thought that some time in the future good results will follow the work.

WANTED.—POSITION AS ASSAYER OR Amalgamator. Capable to take charge of mine and mill. Over 25 years experience. C. S. A., 1212 So. O Street, Tacoma, Wash.

WANTED.—POSITION AS ASSAYER, Amalgamator or Millman. Capable to take charge of mine and mill. Over 25 years' experience. Address ASSAYER, P. O. Box 812, Tacoma, Wash.

"CRACK PROOF"

PURE RUBBER BOOTS

Are the CHEAPEST because

They are the Most Durable.

They have been used by miners for over Twenty Years. Any one who has worn them will tell you how good they are.

BEWARE OF IMITATIONS.

See that the heels are stamped

"Union India Rubber Co. Crack Proof."

FOR SALE BY ALL DEALERS.

Manufactured only by

GOODYEAR RUBBER CO.,

R. H. PEASE, Vice-Pres't and Manager.

Nos. 577 and 579 Market St., San Francisco.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the first (1st) day of October, 1895, an assessment (No. 20) of Ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fourth (4th) day of November, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the twenty-fifth (25th) day of November, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

IOWA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 23d day of October, 1895, an assessment (No. 21) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 2, No. 419 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of November, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 16th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. THOMAS, Secretary.

Office—Room 2, 419 California street, San Francisco, California.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of works, Inyo, Inyo county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 5th day of July, 1895, the several amounts set opposite the names of the respective shareholders as follows:

Name.	No. Cert.	No. Shares.	Amt.
M. J. McDonald, Trustee	298	5,000	$ 500
M. J. McDonald	453	250	25 00
M. J. McDonald, Trustee	454	2,823	282 30
Paul Lotz, Trustee	427	4,000	400 00
E. M. Frank, Trustee	292	8,000	800 00
E. M. Frank, Trustee	377	2,000	200 00
G. P. Rixford, Trustee	145	1,000	100 00
G. W. Luce, Trustee	382	317	31 70
Alex. McLaughlin	302	200	20 00
Alex. McLaughlin, Trustee	360	122	12 20
Alex. McLaughlin, Trustee	414	200	20 00
F. J. Sanders	384	98	9 80
F. J. Sanders	385	35	3 50
R. P. Rasmussen	415	100	10 00
R. P. Rasmussen	433	31	3 10
A. F. Thane, Trustee	448	1,075	107 30
A. F. Thane, Trustee	449	922	92 20
Chas. E. Anderson, Trustee	467	654	65 40
Chas. E. Anderson, Trustee	508	600	60 00
W. W. Sargeant, Trustee	460	378	37 80
W. W. Sargeant, Trustee	505	1,000	100 00
W. W. Sargeant, Trustee	518	1,000	100 00
W. W. Sargeant, Trustee	531	131	13 10
J. H. Isham	462	100	10 00
H. H. Noble, Trustee	523	45000	400 00

And in accordance with law and an order of the Board of Directors made on the 5th day of July, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 12, Rotunda Mills Building, San Francisco, California, on WEDNESDAY, the 4th day of September, 1895, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on September 4th, 1895, the above sale is postponed to FRIDAY, the 4th day of October, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, Cal.

POSTPONEMENT.

By order of the Board of Directors at the regular monthly meeting held at the office of the company on October 3d, 1895, the above sale is postponed to SATURDAY, the 2d day of November, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

QUICKSILVER!

FOR SALE BY

The Eureka Company,

OF SAN FRANCISCO.

ROOM 1. 426 CALIFORNIA STREET, SAN FRANCISCO.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCTOBER 22, 1895.

548,504.—ELECTRIC RAILWAY—Beach & Kern, S. F.
548,289.—STEERING APPARATUS—J. Bonner, Tiburon, Cal.
548,441.—CABLE WAY—C. Helmna, Oakland, Cal.
548,367.—SEAT AND COVER—F. G. High, S. F.
548,547.—PUNCH—C. Hood, Puyallup, Wash.
548,375.—DERRICK—O. M. Loveridge, Weaverville, Cal.
548,382.—DOUBLETREE—O. McDermott, San Jacinto, Cal.
548,265.—AMALGAMATOR—J. D. McKinnon, Portland, Or.
548,383.—SEPARATOR—J. D. McKinnon, Portland, Or.
548,261.—PARCEL CARRIER—Merriam & Scott, S. F.
548,219.—CAR BRAKE—C. B. Oviatt, North Yakima, Wash.
548,386.—GANG PLOW—O. T. Owens, S. F.
548,201.—PURIFICATION OF OILS—W. B. Price, S. F.
548,593.—HAY LOADER—Rehart & Bernard, Lakeview, Or.
548,594.—HAY RAKE—Rehart & Bernard, Lakeview, Or.
548,595.—AMALGAMATOR—A. C. Rumble, S. F.
548,463.—CAN HEADING MACHINE—H. Schaake, S. F.
548,464.—CAN SOLDERING MACHINE—H. Schaake, S. F.
548,465.—CAN—H. Schaake, S. F.
548,403.—VOTING MACHINE—T. D. Stroup, S. F.
548,478.—GATE—H. P. Talbot, Harrisburg, Or.
548,338.—WATER FILTER—W. A. Williams, S. F.
548,341.—FRUIT WASHER—J. C. Wilson, South Pasadena, Cal.
24,768.—DESIGN PENCIL CLASP—W. E. Wood, Portland, Or.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special meution:

CARPET-SEWING MACHINE.—Charles Volberg, Oakland, Cal. No. 547,191. Dated Oct. 1, 1895. The invention in this machine consists of an improved means for adjusting the looper. The machine improved upon is that shown in the Grisel patent, No. 296,844, of April 15th, 1884. The difficulty of the old means of adjustment has been the uncertainty and inaccuracy of the regulator, due to having to adjust the finger at two points, rendering it possible to adjust one too much and the other too little, and vice versa. In the present improvement the finger piece is adjusted by the operation of a single set-screw, whereby both the necessary adjustments can be effected accurately and with facility. The improvement consists of the combination with the frame provided with a fixed lug, a reciprocating needle and a looper-actuating lever, of a looper having a shank journaled in said lever, and means for adjusting the looper relative to said needle, comprising a two-armed bar fixed to the looper shank, a regulating lever pivoted to one arm of said bar, having one end nominally in contact with an extension of the actuating lever, and its other end in position to contact with said lug, adjusting means carried by said regulating lever and co-operating with the other arm of said bar, and means for holding the latter arm in yielding contact with said adjusting means.

SAFETY GUARDS FOR CARS.—Harlan H. Henley, San Francisco, Cal., assignor to the Henley Car Fender Co. of same place. No. 547,258. Dated Oct. 1, 1895. This invention relates to an apparatus which is especially adapted for application to street cars for the purpose of preventing human beings and other objects from passing beneath the wheels of a moving car. It consists of a framework projecting forward from the car body, having a swinging guard suspended from the front. This guard has its rear end connected with a trigger or disengaging device, which, in turn, operates the fingers by which the object is to be picked up. These fingers are flexible and horizontal, having the tips moving vertically and independently so as to yield as they pass over the surface when depressed thereon. These fingers are attached to fulcrumed finger-bars, which, in turn, are connected with the tilting levers upon the frame above, and the fingers are normally held a short distance above the surface while the car is traveling. If the swinging guard strikes any object, it disengages the latches, and thus drops the fingers immediately upon the surface over which they move so closely that any object in front of them will be picked up and will rest upon the table or support at the rear of the fingers. Each finger has a sliding, independently movable, spring-actuated tip so constructed as to yield and also to raise any particular finger in case it strikes an insurmountable obstruction, while the fender is resting upon and moving over the surface of the ground.

CONCENTRATORS.—Jehu Jacobs, Henley, Cal. No. 547,640. Dated Oct. 8, 1895. This invention relates to an apparatus for separating valuable, precious and heavy metals and sulphurets from worthless sand or tailings. It consists of inclined suspended tables, over which the material to be separated is caused to flow, a longitudinal crank shaft, a transverse shaft geared thereto, connections from the longitudinal shaft to the table, and a cam on the transverse shaft, a fulcrumed lever having an arm connected with the table, and a second arm in the path of the cam whereby the tables are caused to oscillate sidewise and endwise, and the tables at the same time are given a slight shifting or tossing motion. In conjunction with this are screws or mechanism whereby the angle of inclination may be adjusted, and a bumper whereby the return of the table is abruptly stopped after it has been moved forward.

THILL COUPLINGS.—Hugh Gaw, San Francisco, Cal. No. 547,637. Dated Oct. 8, 1895. This invention relates to a device for securing shafts or thills to carriages. It consists of axle clips having chambered extensions at their front, and shaft irons having cylindrical heads adapted to fit the chambers of the extensions, springs fulcrumed to the clips below the chambers, bars or keepers engaging the springs at a point above their fulcrum points, whereby the springs are clamped in place so that their upper ends form contact with the shaft irons and retain the shafts elevated to prevent their being disengaged.

The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address

THE PELTON WATER WHEEL CO.,
121 MAIN STREET, SAN FRANCISCO, CAL.

THE WILSON
HIGH GRADE STEEL

SHOES
—AND—
DIES.

Guaranteed to Wear Longer and Prove Cheaper than any others.

Made by use of Special Appliances.

PATENTED AUGUST 16TH, 1892.

—Made only by—

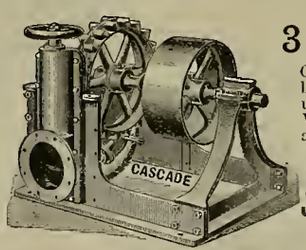
Western Forge and Rolling Mills,
ST. LOUIS, MO.

WM. A. HEWITT, - - Agent,
11 and 13 First St., San Francisco.

P. & B.

INSULATING TAPE.
ARMATURE VARNISH.
ELECTRICAL COMPOUND.

STANDARD OF EXCELLENCE—USED IN ALL FIRST-CLASS ELECTRICAL WORK.



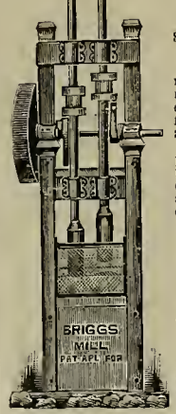
Samples and Circulars on application.

PARAFFINE PAINT CO. 116 BATTERY STREET, SAN FRANCISCO. 221 SOUTH BROADWAY, LOS ANGELES.

Sole Manufacturers of P. & B. Paints, Roofing, Building Papers.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from



3 Feet to 2000 Feet.

Our experience of 33 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

Send for a Pamphlet of either Wheel and write full particulars.

JAMES LEFFEL & CO.
SPRINGFIELD, OHIO, U. S. A.

The Briggs
TWO-STAMP MILL,

850-lb. stamps; weight of mill, 6000 lbs.

The most substantial mill ever offered to miners; discharges both ends and front; will crush from 6 to 10 tons per day; any one can set it up.

Complete as per cut, price $450.00. This mill is furnished with 9-inch cast steel shoes and dies and substantial indepen. dent iron guides.

Western Manufacturing Company,
114 and 116 Mission St., San Francisco,

Builders of all kinds of Saw Mill and Mining Machinery, Engines, Boilers and Special Machinery.

Mining Pipe!

STEEL OR IRON.—We make pipe of either, but recommend STEEL, it being superior to iron in many particulars and inferior in none.
COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.
COMPETITORS.—Our competitors say we have the best appointed Pipe Shop on the Coast.

SCHAW, INGRAM, BATCHER & CO., Hardware Merchants,
SACRAMENTO, CAL.

ELECTRICAL ENGINEERING CO.,
MANUFACTURERS OF
Dynamos and Electric Motors
FOR THE TRANSMISSION AND DISTRIBUTION OF POWER.

ELECTRIC POWER APPARATUS

For QUARTZ MILLS, HOISTING, PUMPING, DRILLING, and all Mining Work where Long Distance Transmission is required, a Specialty.

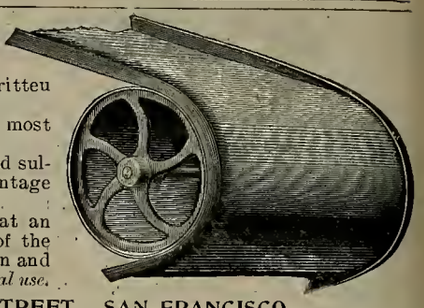
OFFICE AND WORKS:
34 and 36 Main Street.....San Francisco, Cal.

GIRARD WATER WHEEL.
34 MAIN ST. SAN FRANCISCO, CAL.

Highest Efficiency and Accurate Regulation.

SEND FOR CATALOGUE.

Hoskins' Patent Hydro-Carbon Blow-Pipe and Assay Furnaces.



No dust. No ashes. Cheap, effective, economical, portable and automatic.

LEE D. CRAIG,
Notary Public and Commissioner of Deeds,
316 MONTGOMERY STREET,
Bet. California and Pine, SAN FRANCISCO, CAL.

THE BLASDEL IMPROVED ORE CONCENTRATING BELT.

We are now having our belts made by the best rubber manufacturers in New York and Boston, under written guarantees both as to quality and mechanical construction.

We have been granted two United States patents for improved devices in concentrating belts, the first and most important of which is for a slight riffling of the surface at intervals and crosswise of the face of the belt.

While these riffles are only about one-thirty-second of an inch in depth, they are very effective in saving floured sulphurets and reclaiming quicksilver and amalgam that may escape from the plates, thus gaining a large percentage of values that would go off with the tailings from belts with entirely smooth surfaces.

Our second patent is for an improvement in the flanges which practical mill men will appreciate. They stand at an acute angle inwardly, therefore they thoroughly confine the pulp on the belt, and in passing over the end pulleys of the machine, he partly down, consequently do not crack or break, as do the old-style flanges; thereby much vexation and loss is avoided. *We keep in San Francisco and New York belts of all lengths and widths suitable for all concentrators in general use.*

BLASDEL CONCENTRATING BELT CO., HAYWARDS BUILDING, 419 CALIFORNIA STREET, SAN FRANCISCO.

RISDON IRON WORKS.

Office and Works: Cor. Beale and Howard Sts., San Francisco.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.

PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXXI. Number 19.

SAN FRANCISCO, SATURDAY, NOVEMBER 9, 1895.

THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Artificial Stone and Concrete Work.

The time when Art's proudest triumph was to imitate Nature has passed. There is no longer imitation in the industrial arts, but in many cases substitution and improvement. In the matter of stone the slow processes of natural accretion have been hastened by artificial combination of mineral elements and while yet plastic the product has been moulded into shapes of use and beauty, with an economic saving and without loss of wearing value. The accompanying illustrations give a good idea of the appearance of one form of artificial stone and concrete work now being extensively used in this State. The work portrayed is in southern California, where Gray Bros. of this city, who have contracts for the work herewith illustrated, have employed from 300 to 500 men. Though not as massive as the great aqueducts of Rome—which, after the lapse of 2000 years, still serve in places the purpose of their creation; yet the southern California irrigating canals are of more present utilitarian importance and will endure in that mild climate long enough to return many thousand per cent on the original investment. The engravings give a good general idea of the appearance of the work during construction and the finished structure. The Gage canal at Riverside is over eighteen miles in length; the ditch is five feet wide on the bottom, twelve on the top and five feet deep. The fact that after cementing the flow of water doubled in volume is indicative of the value of such work wherever practicable.

TWELVE-MILE CEMENT CANAL AT AZUSA.

From J. J. Crawford, State Mineralogist, is received Bulletin No. 6, "California Gold Mill Practices," written by Edw. B. Preston, M. E., field assistant, published at the State Printing Office. It is an 85-page pamphlet, similar in excellence of a practical character to other publications of the State Mining Bureau. As in the case of those treatises, it is published in response to a general inquiry for further up-to-date information on the subject treated. Practical points as to mill site, mill construction, the details of the several parts, the manner of procedure throughout, are given, together with illustrated descriptions of California appliances, many of which have stood the severest tests and proven themselves worthy of their general adoption and use. Any citizen of this State may obtain a free copy by sending three cents for postage with his application to the California State Mining Bureau, No. 24 Fourth St., San Francisco; the price of the pamphlet to those living outside the State of California is fifty cents, which sum should accompany the order.

It is wired from Visalia that an enterprise now in progress there would be prosecuted at a much faster rate were the superintendent able to secure sufficient mining machinery in this city, but that San Francisco "was fairly stripped of those articles, owing to the unprecedented revival of mining." While it is gratifying to note such demand, it is believed that diligent quest among the manufacturers and dealers in supplies would enable any one to secure all necessary requirements in that line.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Twelve-Mile Cement Canal at Azusa; Twelve-Mile Cement Canal at Whittier; Gage Canal at Riverside, Eighteen Miles in Length, 297. The Sampling and Measurement of Ore Bodies in Mine Examinations, 300-1-2. Views of the Lick Observatory and Its Environment, 303.

EDITORIALS.—Artificial Stone and Concrete Work; "California Gold Mill Practices;" A Reported Lack of Mining Machinery, 297. No More Silver Dollars To Be Coined; Patenting Mining Claims; Copper; Numeration and Chronology of the Ancient Mayas; Improved Methods in the Witwatersrand, S. A., District; The Secretary of the Interior's Decision, 298

SCIENTIFIC PROGRESS.—New Treatment for Spent Oil Wells; Oxygen; Test for Sewage Contamination of Water; Antiseptic Power of Acids; Difference Between Heart Wood and Sap Wood; Machine to Indicate Temperature and Pressure at an Elevation of Several Miles; Composition of a Star; Cause of Cirrus Clouds; A Gold Medal Offered; A Substitute for Hydraulic Cement, 304.

MECHANICAL PROGRESS.—Unnecessary Refinement in Machine Work; Making Tubing; Increasing Illuminating Power of Gas; A Big Dredge; Installation of Gas Engines; Ingenious Method of Welding Lead; A Mammoth Church Bell; A Great Steam Pipe; New Smoke-Consuming Device for Furnaces; A New Experiment, 304.

ELECTRICAL PROGRESS.—The Propagation of the Magnetism of Iron; Doubtful Electrical Projects; Electric Test for Jewels; Plans for the Establishment of Railways in South Africa; Next Step in the Development of the Telephone, 305.

PRACTICAL INFORMATION.—Metals and Minerals; A Convenient Rule; Value of Carcass of a Dead Horse; Suggestion for Clear Cistern Water, 305.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 306-7.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 314.

MISCELLANEOUS.—Concentrates, 299. The Sampling and Measurement of Ore Bodies in Mine Examinations, 300-2-3. The Lick Observatory, 303. Coast Industrial Notes; Personal; Ratio of Gold and Silver, 308. Notices of Recent Patents, 315.

At the time the obnoxious rules of July 9th, 1894, were promulgated it was said to the editor of this paper by a department official at Washington that the real intent was to make many hangers-on let go, or get a United States patent. The alleged intent was unlikely, the connection between the two being indefinite. But it is a fact that too many delay in securing patents. Wherever practicable, it is good business for the holder of a mining claim to get a U. S. patent for it. If he wants to hold it, he can do so in peace; if he wants to sell it, nothing, not even the proven value of the claim itself, will so aid in the sale as the ability to show the prospective purchaser a United States patent for it. In many a buyer's mind the question of title is uppermost, and if he can be sure he isn't buying a lawsuit he will be more likely to close the bargain. It does not follow that the purchase of an unpatented mining claim involves probable litigation, but it is certain that a man who has a United States patent for a claim stands a better chance of selling it, if so disposed.

One year ago a prominent Butte, Montana, copper man said he expected to see copper go to six cents inside of six months. Since then it has gone from nine to twelve cents, and the great demand in the electrical industrial field justifies the belief that unless new developments are made or old ones reopened the red metal will go higher. Men who have long mined copper say it can be now produced at a profit of four and oue-half cents. Probably when all things are considered this is a low figure, but it is almost demoustrable that at twelve cents there is an average 100% profit to the producer. Hence the quest for copper is second only to the present pursuit of gold. California's copper deposits are being exploited anew and on the other side of the Sierras our Nevada ueighbors are fully awake to the advantages possessed in copper veius which for the last twenty years have been unworked. As late as 1882 the Esmeralda Smelting Co., at Copper Mountain, on the Carson & Colorado road, turned out 300,000 pounds of copper, the last produced in the State, as the price, which had run down from twenty-four ceuts a pound, precluded any possible profit. Since then the cost of production has decreased, due to improved metallurgical methods. There are few parts of Nevada's 100,000 square miles that do not coutaiu copper belts of varying value, though it is doubtful if in such a sparsely settled State, even at the present relative prices of production and sale, their output could he made profitable because of transportation cost. The northern part of the State is more fortunate in transportation facilities, and it is believed that an up-to-date smelter built with reference to freight charges would be a profitable Nevada enterprise.

It will be remembered that some months ago Commissioner Lamoreux, of the General Land Office, dismissed a protest filed by E. H. Benjamin against the patenting of sundry tracts of mineral land to the Southern Pacific Co. The matter was commented on as being characteristic of that official, who has throughout evinced a desire to favor the corporation in its attempted absorption of the public area, and the belief expressed that were the committee on mineral lands of the California Miners' Association to appeal the case to the Secretary of the Interior justice might be accorded. It was so appealed. Last Tuesday the Secretary of the Interior affirmed Commissioner Lamoreux's decision. He accompanies his affirmation by language that indicates his bias. He argues the question, not in a judicial manner, but as an advocate of one of the parties in controversy, and plainly shows his desire to deny the miners a fair hearing. He even goes out of his way to defend his rules of July 9, '94, and absurdly argues that there is no need for a mineral land commission in this State similar to that created for Montana and Idaho, and now contemplated by legislative bills drawn up by the committee of the association which has in charge that branch of the work. He begs the whole question and detracts from the dignity of his high office by puerile comparisous and assumptions. The railroad corporations of this State are to be congratulated on having such powerful assistants as Messrs. Smith and Lamoreux, who happen to be in positions that empower them to attempt injustice. Ordinarily such service commands returns commensurate with the contempt which attaches to men who so degrade their official positions. Mr. Smith's nimble haste in reaching matters in two weeks that usually take a year to reach is also noticeable. His zeal should commend itself to those who can appreciate and reward it. Throughout, the plain fact is ignored by both Commissiouer Lamoreux and Secretary of the Interior Smith that the Miners' Association assumed nothing, simply pointed out the falsity of the assumptions of the railroad corporations, protested against such assumptions being taken as facts, and asked for an examination of the question itself. It is apparent that the same haste which has characterized the affirmation of the Commissioner's dismissal of the protests will distinguish immediate effort to have all the lands in question patented to the railroad company before Congress meets next month. While in such an event proceedings might be instituted for annulment because of manifest fraud, yet it is possible to forestall the necessity for such action by a final appeal to the President of the United States, who personally promised the association's representative that he would see that justice was done in the matter. Justice is all that the miners ask, and so far in this matter it has been steadily denied them. It is further believed that those rules of July 9th, '94, under which all this unfair surrender of public lands is attempted hy corporate and assisted by Government officials, are *ultra vires*—outside the jurisdiction of the land department and proper only to the courts. The committee on mineral lands will have a meeting next Monday, the 11th, to take action thereon.

Old-time Nevada acquaintances of Jos. T. Goodman hear with surprise and delight that that genial journalist has signalized some recent years of study hy working out the whole system of numeration and chronology of the ancient Mayas. The work involved infiuite care and a certain amount of drudgery, and in devoting so many years to the effort Mr. Goodman deserves the fame that will assuredly accrue to the man who has done for Central America what Rawlinson and Champollion did for Egyptian hieroglyphics. Squier, Strain, Rogers and other explorers long ago made us acquainted with the fact that in Central America exist evidences of a prehistoric civilization that rose and endured and passed away many thousand years ago. The ruined cities, the stupendous testimonials of skilled habitants, attest the existence of a people whose origin or obliteration is as vanished as the morning mists that melt into the infinite azure, but their records in stone hitherto undecipherable presumably give the salient points of their history. Twelve years of patient toil has enabled Mr. Goodman to read these records and reconstruct the history of a people who had disappeared from the earth before Assyria had risen or Egypt had thought of pyramids. He is about to publish in London three hooks, the result of his labors; it is a matter of regret that such publication should not be a Californian one, and a matter of some local shame that a local institution so ahle as the California Academy of Sciences in this city should not have had a direct or indirect share in the work. No similar institution in the United States is so richly endowed, and no similar institution shows so little life. In place of being the center of scientific activity in a country that incites and rewards scientific research, it lies like a snail in a shell, enjoying all the profits and emoluments of Jas. Lick's munificent endowment, and content with heing a little mutual admiration society. Mr. Goodman's work will appear next year and will attract universal attention to the most ancient civilization of which there is any record extant.

The South African *Mining Journal* furuishes figures showing that the total tonnage crushed by all the mills of the Witwatersrand district from its discovery until the 30th of last June was 11,500,000 tons, from which was secured 7,651,935 ouuces. It argues that by the present system of wet crushing and mercury amalgamation ten per cent of the gold in the ore crushed was unneccssarily lost, and, on the principle of the Montana man who annually lost $5000 by not having hogs to fatten on dropping acorns, our South African contemporary figures an annual loss of £2,160,000, and, unless improved methods are adopted, argues that the loss in the next decade will he £28,000,000. Apart from the created atmosphere of fancy in which the *Journal* flaps its wings, its remarks as to past losses are worthy of uote. The loss of gold was long a matter of serious conceru to California miners, who have of late years devised means hy which such loss is reducod to a minimum. A California miner—Charles Butters—in charge of one of the biggest concerns in South Africa—the Rand Central Ore Reduction Co.—has a project to increase the secured percentage of gold in the ore that company treats, £40,000 having been appropriated for the erection of a plant where efforts in that direction are justly expected to achieve the same measure of success met with in similar propositions elsewhere. In this regard it is to be noted that California experience has sometimes been to the effect that the recovery of the "submerged tenth" of the gold was too costly to he continued. While from a scientific or metallurgical point of view it was eminently satisfactory to show that the resultant slimes contained less than five per cent of the gold in the ore, yet the practical workings of the plan suggested that if it cost $10 additional to get $6 in gold additional, it would be more economical to let it go in the dump. It is, however, on such experimental work that ultimate practical success is hased, and the South African operations will be of interest. When Gardner Williams had charge of the cyanide plant of the Crown Reef, in the Witwatersrand district, he projected a somewhat similar form of treatment for the 80,000 tons of slimes in that company's control, estimated to contain 3½ dwts. of gold to the ton, or nearly 10,000 ounces.

By order of the Secretary of the Treasury no more silver dollars will be coined at the United States mints after next Saturday. This, virtually, converts all the silver bullion now held by the government into gold obligations. Of this silver bullion the United States Treasury uow holds 137,644,000 ounces, which cost the government $124,080,323; its present coining value would he ahout $175,000,000. In connection with this matter it is worthy of note that the statement so generally made, that silver dollars are directly redeemahle by the government in gold, is not so. Silver dollars are not redeemable in any other form of money. Silver certificates are redeemahle hy the government in silver dollars only. It is, however, further to be observed that in practice silver dollars are readily exchangeable for paper money, and the latter are eaiily couvertible into gold. But the greenback is the only government jorm of exchange or money, other than gold, which is directly redeemable by the goverument in gold when so demanded.

Concentrates.

THREE new papers made their appearance in Leadville, Colo., last week.

GOVERNMENT statistics place the cost of producing copper at 4½ cents per pound.

THE Alma, Amador, M. Co., near Jackson, will sink their shaft 600 feet deeper.

THE Church Gold Mining Co. paid a dividend of five cents per share on the 7th inst.

THE new mill at the Golden Cross, San Diego Co., is the largest under one roof in California.

FELIX CHAPPELLETT is about to incorporate the Eureka mine on the Forest Hill Divide, Placer Co.

THE silver production of 1894 had a coining value of $84,000,000 and a commercial value of $31,422,000.

LONDON mining papers estimate the Rand, South African, gold output for '95 will approximate 2,300,000 ounces.

LAST Monday the Ontario, Utah, Company shipped to San Francisco 51,516 fine ounces of silver.

ON the recommendation of experts the Oneida mine shaft, near Jackson, Amador county, is to be sunk to a depth of 1700 feet.

J. L. HALEY and E. M. Price have bonded the Sunnyside mine, West Point, Calaveras Co. A five-stamp mill is to be erected.

MR. ISAAC'S, now known as "Barney Barnato," the South African mining magnate, is reputed to be possessed of $150,000,000.

THE closing of the New Orleans mint leaves only two United States mints in operation in this country—Philadelphia and San Francisco.

MOST of the Klamath river miners have pulled out for the season, to save their wheels and apparatus from a probable December freshet.

PRELIMINARY steps have been taken for the establishment of a 200-ton matteing plant at Rossland, B. C., for the reduction of Trail creek ores.

THE contract for running the Butte Basin Mining Company's new tunnel at Butte City has been awarded to J. Phillips of Placerville, Cal.

THE Redding land office has received notice that patents were issued October 9th to the C. P. R. R. Co. for about 65,000 acres of land in Siskiyou county.

GOVERNMENT special timber agents are making rigid investigations concerning the cutting of timber on government land in this State and Montana.

SUPERINTENDENT SMITHERUM of the Golden Gate mine, near Sonora, Cal., has determined to put in twenty new stamps. The cost will be upwards of $15,000.

THE Nevada County Tailings Co. has bought on a $10,000 basis patent rights of a process to work tailings, and propose to put it in operation in Sierra and Nevada counties.

THE hoisting works on the Midday mine, on the Grass Valley road, were totally destroyed by fire last Tuesday afternoon. The mine is owned by C. R. Clark.

THE Grass Valley *Union* bears that Mrs. Huntington intends starting up the old Banner mine, which was worked by her brother, Earl Brown, several years ago.

THE *Bee* says Yuma county, Arizona, is going to have two more good mines at Gates' Landing and Thomas camp. Mills will be put up at both places within six months.

THE air compressor at the Frisco mine on Canyon creek has been completed. It is the largest in the State of Idaho, being 500 horse power. The plant was started up last week.

DESERT QUEEN, San Bernardino Co., mine owners have settled their squabble. H. B. Adsit, of Colorado, has been appointed superintendent, and work will be resumed next week.

LABOR COMMISSIONER FITZGERALD has an order for 100 teamsters from the Mountain Mining Co., Shasta county, and one for twenty miners to go to El Dorado county, at $2.50 per day.

CAPT. PLUMMER has bought the Black Hornet mines, eleven miles from Boise, Idaho; the stated price is $100,000. A daily carload of $40 ore is now being shipped to Denver and Salt Lake.

THE Merrill Gold Mining Company has incorporated. Capital stock, $100,000. Directors—J. F. Cowan, T. P. Newton, Butte; J. M. Merrill, Oakland, Cal. They will operate at Basin, Montana.

AN exploring party finds that the reported volcano in the Olympic mountains proves to be the burning of dead timber in a deep ravine where there was also a lead of lignite coal, which was ignited.

IN a part of San Diego county, this State, comprising nearly 3000 square miles there are six lively mining camps, but in that entire region there is no justice of the peace—probably because there is no need of any.

A RECENT judicial decision is to the effect that if work is renewed on a claim after it has been open to relocation, but before relocation, the rights of the original owners stand as though there had been no default.

MESSRS. RIDEOUT AND HAGGIN have finally decided to work the Pershbacker claim themselves. It is in Butte Co. and was extensively advertised in this city some time ago. A shaft is being sunk to tap the old river channel.

THE *Bulletin* says it is expected that the report of the Boston & Montana Mining Company for the calendar year of 1895 will show a surplus of $750,000 after paying $7 per share in dividends, and ground opened for eight years ahead.

STATEMENT is made that the item in last week's issue regarding the reported sale of the Black Oak mine to N. S. Wright for $60,000 is not wholly correct. It is stated that the group of three mines cannot be bought for less than $800,000.

DURING September the Simner & Jack mine, Johannesburg, South Africa, crushed 11,820 tons, obtained 5472 ounces of gold from mill, 599 ounces of gold from chlorination, and 1712 ounces of gold from tailings by cyanide. The month's profit was $64,000.

MINERS returning from Cook's Inlet, Alaska, tell of great wealth secured at Canyon creek, thirty-five miles from tidewater, where dirt was found which went "$50 to the pan." They deny former stories of starvation and say they will go back next spring.

AN item in last week's "Concentrates," regarding the App mine in Tuolumne Co., would have been more exactly in accordance with the facts had it been stated that the 20 stamps recently erected there are not in addition to any mill heretofore built there.

THE capital stock of the Rawhide Mining Co. of West Va. is $5,000,000; the property has been transferred from the Guild Gold Mining Co. to the new corporation, and will be listed on the Boston Stock Exchange. The present output is stated to be $84,000 monthly.

THIRTY German business men of San Francisco were given a reception at Nevada City last Saturday, when they arrived to inspect the Home and Cadmus mines, which they are developing. The properties are situated near the Providence and Champion mines.

CAVE COUTS of San Diego has bought the Ranchito mine at Julian for $5500; a twenty-three ton crushing averaged $35. The Cable mine close by the Ranchito will shortly be started up. Alfred James of Los Angeles has bonded the Golden Rule mine in that vicinity.

H. C. STEELE, J. M. S. Egan, J. F. Hook, G. S. De Line, J. W. Nance, C. Vermason, Jas. Patterson Jr., W. F. Bray and Wm. Newport of Perris, Riverside Co., Cal., have incorporated the Perris Mining and Development Co., capital stock $250,000; $15,000 subscribed.

C. C. RUSS expects to have 70 or 80 men at work on the Gold Basin placer mine, not far from the boundary of Josephine and Curry counties, before long. The trail is almost completed, and as soon as that is done work will commence on the ditch, says the Kerbyville, Oregon, *Union*.

THE Temple Bar (Arizona) Company have had their machinery examined by a hydraulic engineer, who reports that the machinery will not stand the immense strain that will have to be put on it when attached to the pumps and as a consequence new machinery will have to be put in.

THE Secretary of the Interior has recommended to the Attorney-General that suit be brought against the Oregon and California Railroad Company, to recover certain lands erroneously patented to the company, situated in the Roseburg, Or., land district, which the road refuses to relinquish.

THE Indians of Metlatahktla island, where gold quartz mines were recently discovered, have won their case in the Department of the Interior against Captain Carroll and others, who sought to develop the island claims. The aboriginals can now work their property or allow it to lie dormant.

A. G. SMITH, formerly of Deadwood, South Dakota, is operating a ten-stamp mill on the Philippine islands, and writes that he got the mill started, but on account of a scarcity of water could only run five stamps. From a twelve hours' run of five stamps he cleaned up three-fourths of a pound of gold.

HON. J. H. TURNER, Premier of British Columbia, is given as authority for the statement that the Rothschilds and Baron Hirsch have taken part in a syndicate which has for its object the development of the mining of that Province. For this purpose $500,000 is said to have been already subscribed.

THE next meeting of the California Debris Commission, to consider applications for hydraulic permits, will be on the 18th inst. In this issue are advertised applications to impound tailings from 17 different companies and individuals resident in El Dorado, Plumas, Sierra, Butte, Shasta and Nevada counties.

UNDER the act of February 28, 1878, known as the Bland act, 291,272,018.56 ounces of fine silver were bought at a cost of $308,279,260.71 and coined into 378,166,793 silver dollars, against an equal portion of which 338,000,000 of silver certificates have been issued, $330,000,000 of which are still outstanding.

THE Placer County Miners' Association reports balance on hand at the beginning of the term, $318.71; receipts during the year, $1277.25; total, $1595.96; entire expenses of the association for the year, $45.70; sent to the State association, $1000; loaned it, $400; total to the State association, $1400; balance in the treasury, $150.26.

DURING October the Alaska Treadwell mill ran twenty-nine days and crushed 20,321 tons ore; 390 tons sulphurets were treated, of a value of $23,636. The bullion produced from ore and sulphurets was $72,467. The ore averaged $3.72 per ton. The expenses were $24,845. The company paid a quarterly dividend of $75,000 on the 28th ult.

AT Stockton the Red Cloud Mining and Milling Co. has incorporated to operate the Red Cloud mine in Amador county; capital stock, $1,000,000; directors, C. A. Brown of San Francisco, C. M. Jackson, D. R. Oliver, W. Campbell, R. H. Eudicott and J. Campbell of Stockton, and J. L. Bryson, C. Zinck and F. Kidd of Plymouth, Amador county.

"I WOULD as soon do without my dinner as miss reading your paper," writes a Chewelah, Wash., subscriber; "Though I note an occasional mistake, I think there is an honest effort to be exactly truthful," says a Los Angeles reader: "I consider the MINING AND SCIENTIFIC PRESS absolutely essential to my business," writes an Amador Co. mining superintendent. Such appreciative remarks received so frequently are duly valued.

THE Placer *Republican* ironically says: One reason why Placer county mines have not received deserved attention from capitalists is that her mines are too close to the railroad. Capitalists are always seeking phantom wealth in some inaccessible country, but a year or so will change all this. Such mines as the Zantgraf, Pike Bell or Black Oak, Marguerite and others will instill confidence into men of wealth and they will seek investments there.

ILLUSTRATING the general increase of business consequent upon activity in the mining counties, the following is taken from the Trinity *Journal*: "There has been more than the usual amount of freight hauled to this county this fall, in the shape of mining material, etc. We learn that an average of 100,000 pounds per week has been and is being delivered, outside of the winter supplies of our merchants."

THREE-DOLLAR MEN at the Diamond Hill mine, St. Louis Gulch, Montana, have struck for $3.50. The mine is a tunnel into the mountain with a raise to the surface, making a vast quarry. Miners break down ore for a forty-stamp mill. The company offered to pay the miners $3.50, but would not accede to the demands of the shovelers. Forty men are out. The engineers and amalgamators were paid $4 per day.

MINING in San Diego county is looking up. A good deal of outside capital is going in. Large bodies of low grade ore have been uncovered in many localities. One mill is reported as turning out $35,000 monthly from this grade of ore. Up to date the Julian district has produced about $3,000,000 from its mines.

THE El Dorado *Republican* says: There are any quantity of mining men in the county, some of them with money and some without it. Many are prospectors looking for diggings because work is scarce in the valleys and the wages so low that they believe they can make more money with the pan and rocker than by hiring out.

ONE of the saddest sights the Colfax *Sentinel* knows of is to see a good mine handled by a man who never worked in one. A man who has not the practical experience, with a little engineering skill combined, will ruin the best mine in the State. Drift mining is a science and the sooner scientific methods are applied to it the sooner will so many bungling failures cease to attract attention.

S. H. HAYES, W. V. Jobes and L. L. Westfall have incorporated the Dixie Mining Co. at Spokane, Wash.; capital stock, $250,000. D. Shondy and J. G. Boyle have incorporated the Peshastin Mining and Milling Co. at Ellensburg, Wash.; capital stock, $100,000. A. C. Brokald and C. S. Fogg have incorporated the Washington and California Mining Co. at Tacoma, Wash.; capital stock, $12,000.

THE Grass Valley *Union* is informed that the French syndicate, of which M. J. Zampella is the promoter, has made a payment of $5000 on each of the following properties which they have bonded: The Allison Ranch and Daisy Hill mines of Grass Valley and the Champion and Providence mines of Nevada City. A cablegram has been received from M. Zampella that a company has been formed to complete the purchase and operate the mines.

ENCOURAGED by the success of the Diestlehorst Bros., in the upper Sacramento, four Oaklanders have built a boat at Alameda Point, organized as the Golden Sands Mining Co., and propose to dredge along the American and Feather rivers. The Lottie is 20x65, draws two feet of water, is flat-bottomed, has a 30 H. P. gasoline engine, and cost $5000. Tolman & Wickman are the captain and mate; they figure on handling fifty tons of sand per day at a profit of $2 per ton and are enthusiastic over the prospect.

FROM Australia come reports of an Adelaide inventor who, it is said, has devised a new form of light stamper battery in which several systems of springs are brought into play, enabling the cams and cam shaft to be entirely dispensed with. In the past, springs have been used to accelerate the downward blow of the stamp, but the special object of the present gear is to assist the upward stroke of the machine and to take full advantage of the rebound and of the molecular elasticity of the parts.

UNDER date of September 30th, John Hays Hammond writes to the London *Mining Journal* from Johannesburg, South Africa, "I have no connection with the syndicate 'Hammond's Matabeland,' referred to in a recent issue of your journal. The A. R. Hammond referred to has been represented as a prominent mining engineer of the United States, and of South Africa. Despite many inquiries among prominent American mining engineers here, I have discovered no one who had ever heard of Mr. A. R. Hammond as a mining engineer."

PROF. WM. P. BLAKE, recently appointed Director of the School of Mines, University of Arizona, has been selected by the Executive Committee on Awards of the United States Columbian Commission, to prepare the report on Gold and Silver Mining; the Accessories, Processes, etc., for publication in the official final report to Congress upon the World's Columbian Exposition at Chicago. He invites exhibitors to send him at Tucson a list of the exhibits made by them, with a full description, together with any printed circulars or pamphlets relating thereto, in order that the report may be made as comprehensive and complete as possible.

THE United States custom house at Northport reports that about seven carloads of ore, of 40,000 pounds each, pass through from the Pilot Bay smelter every week, worth $16,800. The duty on imports from that point at a cent per pound, if all collected there, would amount to $30,000 a month, but a large proportion of the bullion goes through on warehouse entries. The actual collections are about $20,000 a month. There has also been imported from Trail creek during the six months ended September 30th 40,000,000 pounds of ore, containing gold, silver, copper and iron worth $1,200,000, on which there was no duty, for the iron was of no commercial value.

MARCUS DALY, general manager of the Anaconda Company, denies the report that the sale of a fourth interest of the company's stock involves a change of management or that he is going to resign. He says: "After a most thorough examination by experts, we have sold one-quarter of the capital stock at a price that makes the properties worth $30,000,000. Since then part of this quarter has been sold in New York and London at a price which makes the property worth about $37,000,000. No larger interest than this quarter was ever offered for sale." He says that the Anaconda Company in its operations has paid out in Montana, since 1878, $72,000,000, and that the operating expenses and cost of supplies in 1894 was $6,500,000.

TALKING of the South African gold excitement, M. Paul Leroy Beaulean of Paris, France, observes: "Undoubtedly a great many investors will suffer in the end, but this is the price that has to be paid for all great financial and commercial movments. The Rand has opened up an enormous field for the active employment of French capital, which has for too long a time lain, like the talent in the parable, wrapped up in a napkin, and the only way to use it profitably is to boldly risk it. Some of the money would be lost in the great channel of speculation, but by far the greater part cannot fail to be extremely productive, not only to the investor, but to the country generally. Where the money goes there follows trade—in point of fact, the gold fever is the salvation of French finance, and this is beginning to be understood by French investors, who have unbounded confidence in the future of gold mining."

The Sampling and Measurement of Ore Bodies in Mine Examinations.

NUMBER III.

By EDMUND B. KIRBY.

Three methods of cutting are used in the reduction of mine samples.

1. *Shovel-Cutting.* The pile is shoveled over, one shovelful out of a certain number being taken to make the sample. The ratio depends on the bulk and the accuracy required, but may be, say, one in ten for a bulk of over five tons, one in three for 1,000 to 2,000 pounds, and one in two for smaller quantities. The latter is the ratio used in most cases even for larger amounts.

2. *Quartering.*—The pile of ore, thoroughly mixed, symmetrical in shape and with the coarse and fine symmetrically distributed, is flattened and divided into quarters, two of which are taken.

3. *Riffle Cutting,* or "splitting," on a hand-riffle. The size preferred for most underground work has several parallel troughs 1¼ inches wide, and the same distance apart, so that it may be used whenever the sample has been crushed small enough to pass this space. Riffle-cutting is the most accurate and generally the most rapid method in use.

Choice of Cutting Methods.—Shovel-cutting is specially adapted to a large bulk, but when this becomes small, say 150 pounds, it requires too much labor and skill to insure accuracy, and either of the other methods is used. In the absence of a riffle, the work is finished by quartering, but otherwise the riffle is taken as soon as the lumps are small enough. Quartering is therefore used in the intermediate stage when the bulk is too small for rapid shovel work but not yet ready for the riffle.

Assay Office Work.—The assayer is always instructed as to the crushing size and further reduction of the sample package to the final assay pulp. From his result the assay value of each sample is so calculated as to conform to the plan of cost estimate adopted.

Sorting Tests.—In mines where the ore broken and hoisted must have its richer portions sorted out to make a marketable product, it is necessary to determine the percentages of total value and of tonnage which are thus available. Sorting tests are made upon the mine samples, using those coarsely broken portions which were rejected during the first operations of reduction. These are mixed proportionately to form a few group samples, and experieuced ore sorters from the neighborhood are put to work upon them. All the resulting products from sorting each sample are then weighed or measured to determine their relative weights and each product reduced to the assay office package. When underground sorting is done the results of this are also determined.

Mixtures for Analysis.—Since the market value of smelting ore depends largely upon its chemical composition, proportional mixtures for analysis are prepared from the final pulp samples of all such ore.

Metallurgical Tests.—When metallurgical tests are required, such as those for concentration, free-milling pan amalgamation, wet processes, etc., proportional mixtures are made for the purpose, often out of the rejected portions of the mine samples. In securing mixtures for tests on a large scale the difficulties incideut to mill-runs are kept in view.

Ore bodies frequently contain occasional streaks or pockets of high grade silver minerals or metallic gold, and a sample here and there may chance to include one of these, thus giving an assay far above the general average. Since all the samples taken are at best few in proportion to the mass represeuted, the error iutroduced by averagiug in such assays may be very great. It is therefore necessary after plotting the assay results to reject such values, and some arbitrary figure corresponding to a mean of the next adjoining samples is substituted for use in averaging.

It is here necessary to call attention to the danger incurred in the practice of uniting a number of samples and assaying the mixture. It is practically impossible to mix in correct proportions, and this plan also fails to furnish the necessary information about the distribution of values and the limits of pay ore. The results are also liable to serious error from excessive samples as explained above.

THE MEASUREMENT AND ASSAY VALUE OF SECTIONAL AREAS.

All the plane sections which have been selected to serve as the basis of measurement are plotted to scale. The drawing of each section includes all workings, measurements and ore limits shown, together with the sample lines and the figures of their length and assay value. Upon the section is then sketched that portiou of the ore body which, according to judgement, is safely proven by the mine workiugs within the plane of section, aud may therefore be considered "in sight." In this operation a variety of problems are presented, those commonly occurring being illustrated by the typical cases shown in Figs. I to VII.

In each figure the outer heavy black line shows the actual ore body. The heavy dotted line is the limit decided upon for the portion in sight. Within the thiu black lines are the portions supposed to be pay at the time of measurement, and therefore sampled. The shaded areas show the actual pay ore as finally fixed by the sample results.

Fig. I is the section of an ordinary vein presented in a level where the entire thickness of the ore body is visible.

In Fig. III, the actual bounding surface of the body appears at *A*, *B*, *C*, and thus indicates the most probable direction to be given to the curved line limit for ore in sight.

In Fig. II, where no boundaries are disclosed and the ore has no definite structure to guide the judgment, the curved line *A*, *B*, *C*, is taken.

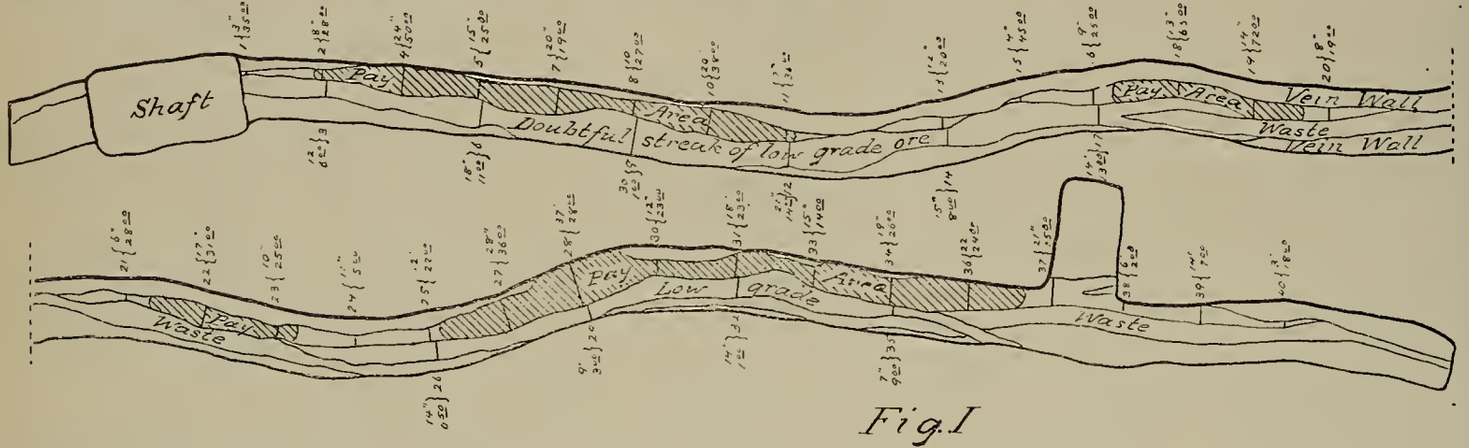

Fig. I

Section of thin Vein, exposed in a level

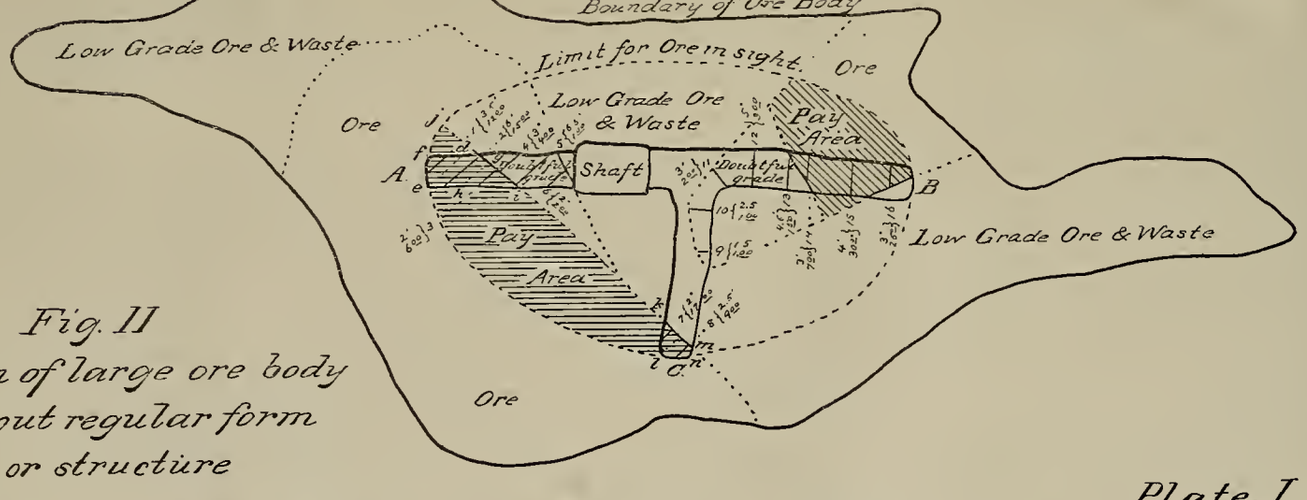

Fig. II

Section of large ore body without regular form or structure

Plate. I

In Fig. IV, the ore body is an irregular mass whose contents are arranged in streaks or layers definite enough to justify the limit *a*, *b*, *c*, *d*.

Fig. V shows a thick sheet composed of regular layers in which the limit *a b c d* may be taken if the entire mass is pay ore, but if it is limited to a few streaks like the two shown, their continuance is less certain and *a b f d* is taken.

In Fig. VI a thick sheet of ore in layers is shown by the single crosscut *K* in the long level *e f*. In drawing the limit *a b c d e f g h*, it is a matter of experienced judgment how much of the sheet is really proven by this crosscut, and how great a length may be given to *a b*.

Fig. VII is a similar sheet, in which the layer-like structure of the ore body warrants the limit *a b c d*. When including areas not actually visible, care must be taken that no one is of such excessive value that its possible variations will introduce a serious error into the final total estimate.

The actual pay areas as included within the intended stopes are determined from the assay values of the samples. Whether these are above or below pay is generally evident from inspection of the values as they appear upon the section drawing, but in many cases it is necessary to make an approxi-

mate estimate of cost for each point. As this calculation is sometimes laborious the most convenient methods are illustrated by the following three special cases.

In all the sections the figures show the sample numbers and lines indicate the sample cuts. The length of each sample cut in feet or inches, and its assay value in dollars per ton are also given for each sample.

Taking the ordinary vein shown in Fig. I, it has been found that the ore in place measures 13 cubic feet per ton and the cost of stoping is $16 per fathom of 36 square feet. The sorting tests have shown that one ton of average ore broken yields 0.50 ton of shipping ore, and that this contains 75% of the total value which was in the original ton broken down.* It has also been estimated that the approximate cost of hoisting, sorting, shipping and smelting will be $12.00 per ton, figured upon the tonnage of ore broken. The following table is then calculated:

APPROXIMATE YIELD AND COST OF STOPING PER TON OF ORE BROKEN.

Thickness of the Pay Streak at the point considered.	Tons per Square Fathom of Ore Sheet	Cost of Stoping per ton.
A streak 4 inches thick yields.....	0.92	$17.33
" 6 " " "	1.38	11.55
" 8 " " "	1.85	8.67
" 10 " " "	2.31	6.93
" 12 " " "	2.77	5.78
" 14 " " "	3.23	4.95

Applying these figures to any doubtful sample point, such as No. 20, the following estimate is made:

Cost of stoping an 8-inch streak, per ton.....	$8 67	
Cost of hoisting, sorting, shipping and smelting, per ton of ore broken.....	12 00	
Total expense.....		$20 67
Value saved is 75% of the assay value of $19.00.....		$14 25

Thus demonstrating that the ore at this point will not pay to extract.

All pay points having been determined and marked, the pay areas which are to be included within the stopes are sketched. (See shaded portions of the figure.) These areas are then measured by scale, or calculated, and the length and average width of each one is also determined. †

In Fig. V the plane of an irregular drift and cross-cut presents a fair cross section of a wide vein whose structure is in parallel layers. Four of the ore streaks shown have been sampled, but only two of these have proven to be above the pay limit. They are so far apart as to require stoping separately, and are therefore treated as though each one was a distinct vein. The pay areas are fixed as in the previous case, and extended to the limit adopted for ore in sight.

Fig. II illustrates the application of this method to the section of an irregular body of milling ore. It is in this case a more simple matter to compare the the assay value of each sample with the total cost of mining and milling, plus the tailings loss, this sum being here taken as $5.00 per ton.

The pay areas outlined are carried only to the limit previously fixed for ore in sight.

In each section the value of its pay areas, either singly or jointly, is determined by averaging all the samples within these areas. In doing this, each sample is given a weight proportional to that part of the area which it represents.

When uniformly spaced, as in some parts of Fig. I, each sample value is multiplied by the length of its line and the sum of the products is divided by the sum of these lengths.

When irregularly distributed, it is necessary to sketch by judgment that portion of the pay area which may be allotted to each sample. In doing this, due regard is paid to the structure of the ore, whether homogeneous, in layers or otherwise. In every such portion the number of square feet is then measured and multiplied by the value of its sample. The sum of these products divided by the total area gives its average value.

In Fig. II the pay area $e f j m n l$ has been exposed for sampling only at two places, *A* and *C*. The average value of each part thus exposed, such as $e f d i$, is first determined by letting each sample represent the ore half way to that next adjoining. Sample No. 1, therefore, represents the portion $e f d$; No. 2 represents $e d g h$; and No. 3 represents $h g i$. The average value of part $m n l k$ is determined in the same way. The number of square feet in each of these two exposed parts is then multiplied by its average value thus determined, and the sum of both products divided by the sum of both areas. The result is taken as the average value of the unseen part $e i k l$. The part $d j f$ is assumed to have the same average value as $e f d i$.

In Fig. V a variation is made from the plan just described because of the layer-like structure and the distance between the exposed places. In the upper pay streak the average value determined as before at each of the two exposed places, $h m l g$ and $n q u r$, is assumed to extend half way through the unseen portion to the line $e z$.

Fig. VIII illustrates the use of this method for averaging samples in the section of probable ore exhibited by a vein outcrop. The samples were taken wherever the ore was uncovered, from scattered outcrops and shallow prospect pits. The structure of the vein was very regular, being in uniform layers, so that each sample was assumed to represent the layers cut by it for a distance half way to the next adjoining samples. For instance, the sample line $a d$ represents the area $a k l b + b i j d + c g h d + a e f e$.

It will be noticed that these fractional areas are not all represented with the same degree of probability, and sample $o p$, for instance, is more certain to correctly represent the area $p q t u$ than area $o r s q$. This is because the samples could not be uniformly distributed. If it happens for this reason that any areas are not well enough represented for the object in view, they should be excluded. In this case it was sufficient for the purpose to include all parts of the area within $w x v r$.

The same method is used for all special problems of this kind such as where samples are taken irregularly over a large open quarry of ore, or where a mass is pierced by scattered bore holes, or exposed by test pits. A case of the latter is shown in Fig. XIII, where the thickness and value of the ore sheet cut by each pit is given by figures. The outer line is the adopted limit within which the ore body is considered probable, and the dotted lines show the area allotted to each sample point. Each area is multiplied by the ore thickness to give the volume,

Fig. X

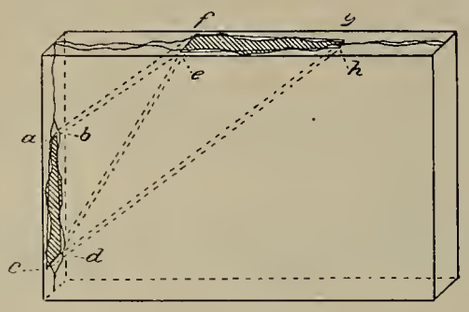

Fig. XI

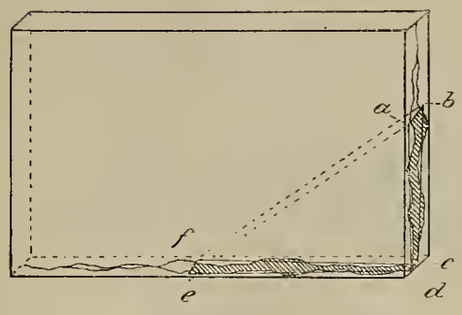

Fig. XII

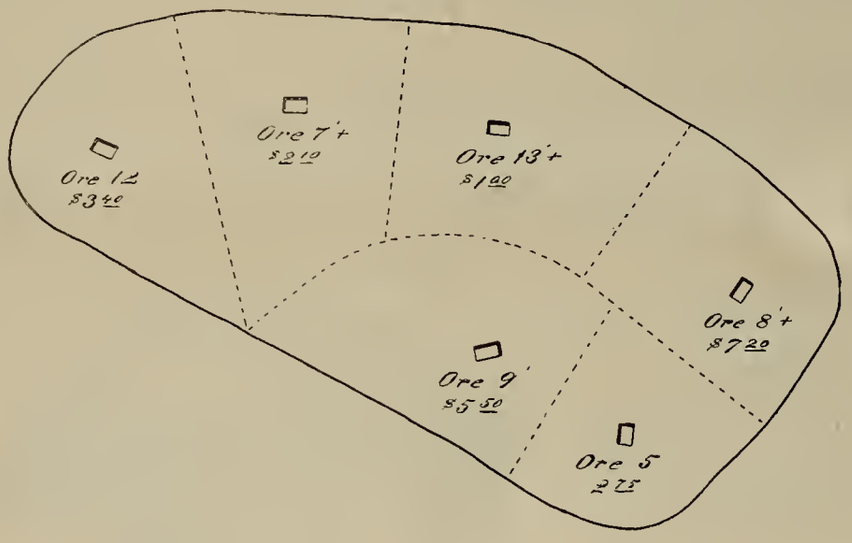

Fig. XIII

Plate IV

*While the results of sorting vary according to the grade of the ore, and are not the same for any two points in the pay streak, it is nevertheless accurate enough for this purpose to use the average figures.

†Of the well known methods for measuring such areas the following will generally be found most convenient and rapid for this purpose:

A small piece of thin transparent paper is ruled with parallel lines, 2, 5 or 10 feet apart by scale, as the case may require, and this is placed over the area to be measured. The length of the strips thus formed are then measured by a scale.

and this is multiplied by its sample value. The sum of the products is then divided by the sum of the volumes.

THE MEASUREMENT AND ASSAY VALUE OF VOLUMES.

The object of measurement is always to determine the *most probable* volume and value indicated by the sections for the unseen interior of a block. How closely these figures agree with the facts depends on the regularity of structure in the ore deposit and also on the proportion between the volume of ore in the block and the area of ore exposed in its sections. Blocks are frequently thrown into "ore probable" because the distance between the two opposite faces is too great for the small amount of ore exposed in them.

The judgment acquired by long experience in the structure of ore deposits is necessary to decide these questions so that the results will have the certainty required for "ore in sight." It is also necessary to judge how much these most probable figures may vary from the truth and apply the safeguards and the factor of safety hereafter mentioned.

The cases most frequently presented in practice are illustrated by Fig. IX, which is a section on the plane of an ordinary vein, whose thickness does not exceed the width of the mine workings. The pay areas determined in the various sections are indicated by heavy black lines.

Blocks with Two Parallel Sections.—This case is illustrated by Block *C*. It is treated as a prismoid whose end areas are constituted by the sums of the pay areas in each section. Unless one end area is very much smaller than the other, the use of the prismoidal formula is an unnecessary refinement. It is generally sufficient to average end areas and multiply by the perpendicular distance.

The average assay value per ton is obtained by multiplying the average value in each section by its total pay area and dividing the sum of these products by the sum of the areas.

Blocks with Three Sections.—Block *B* is of this class, having the sections $n\ k$, $i\ j$, $g\ h$. Two of these sections are often found to be more representative than the third. Its results are therefore sometimes omitted in whole or in part, and sometimes merely given less weight. When all the sections are used, the block is measured by the *Method of equivalent figures.*

Taking Block *B* as an illustration, the sections $g\ h$ and $i\ j$ each have one pay area, while section $n\ k$, which cuts two ore bodies, chances to expose three pay areas. The number of square feet, average value, actual length and average width, have been determined for each of the five areas. The purpose is to sketch within the block an average figure assumed of a certain uniform thickness, and of such shape that it will be the most probable equivalent of the pay ore included in the actual stopes.

The uniform thickness adopted for this purpose is the average thickness of the pay ore, which is found by adding the five pay areas and dividing by the sum of the five lengths. Each pay area is now divided by this uniform thickness, giving the length of an equivalent area, and these *assumed lengths* are plotted to scale in their average positions. (See lines $a\ b$, $w\ r$, $q\ s$, $t\ u$, $r\ x$.)

The equivalent figure shown by the shaded portions of the block is now sketched from these lines. In doing this due regard is given to the indicated structure, the object being to place the figure in the position probably occupied by the assemblage of pay portions. Assuming that in this block the main shoot evidently passes from $a\ b$ to $x\ q$, the figure is drawn symmetrically between them, allowing each area to represent conditions half way through the block. The area $w\ r$ thus appears to be a side projection, and the figure $w\ r\ z\ y$ is drawn from it to meet the main figure at the nearest point. The area of the entire figure is then measured by scale and multiplied by the uniform thickness. Block *G* illustrates a similar case.

Fig. X shows Block *B* when the structure indicates that one or more bodies extend between sections $i\ j$ and $k\ l$. This gives two equivalent figures $a\ b\ v\ x$ and $w\ r\ q\ s\ e\ t\ u$, or it may be treated as a combination of the simple cases under I and III.

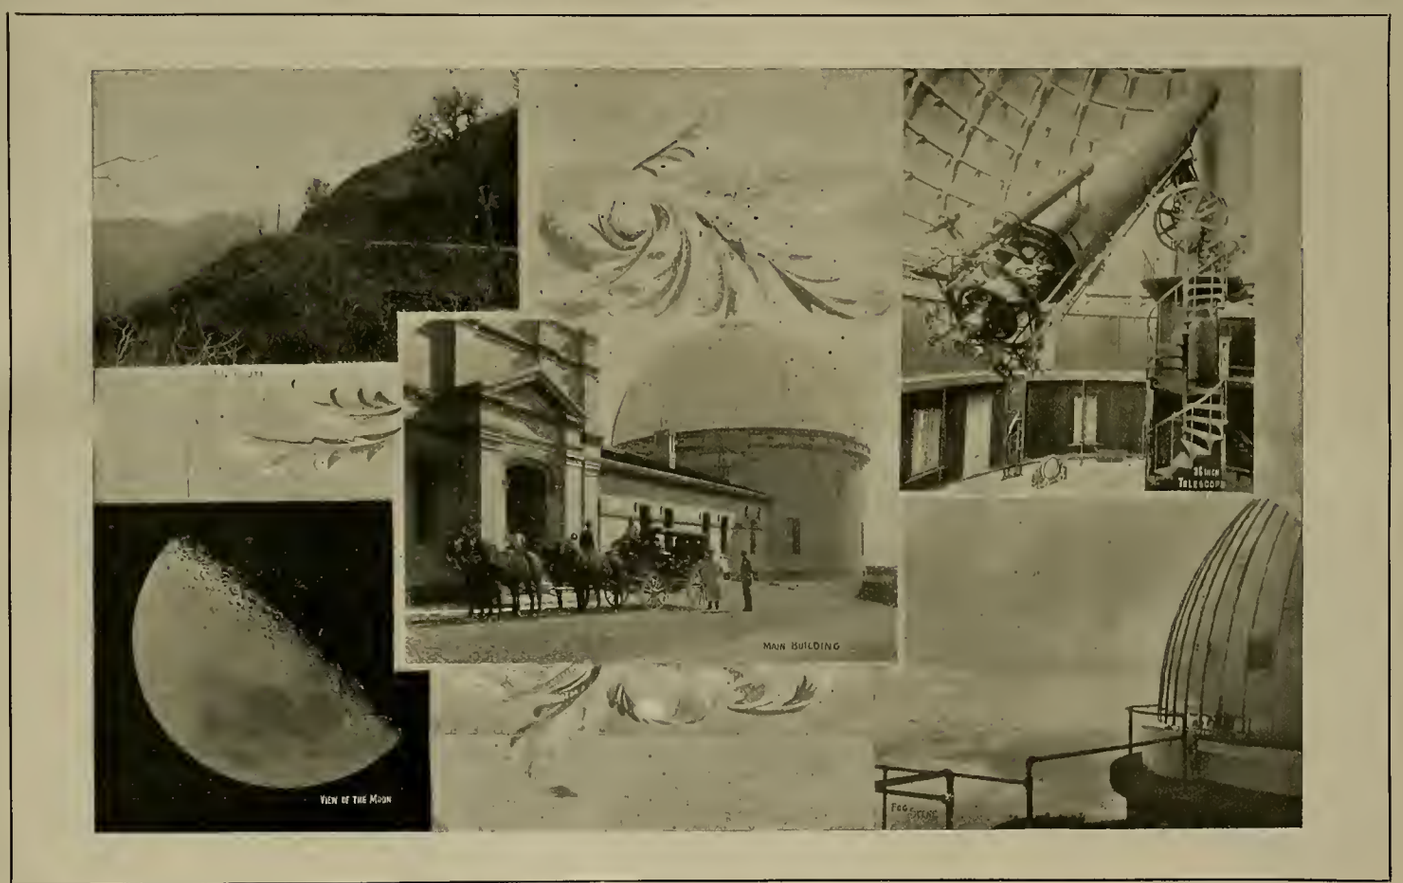
In the method of equivalent figures, the average value is determined by multiplying the value of each pay area by that portion of the total volume which it represents. The sum of the products is then divided by the total volume.

Blocks With Two Perpendicular Sections.—In the simple case illustrated by Fig. XII the pay area in each section is converted to an equivalent trapezoid like $a\ b\ c\ d$, whose shape conforms as closely as possible to the average actual shape of the pay streak by having the same length and by being wider at one end than the other, if necessary. The ends $a\ b$ and $c\ d$ are parallel. The two trapezoids are sides of an irregular wedge to which the prismoidal formula is applied.

Fig. XI shows in perspective the case of Block *F*, Fig. IX. Here the areas are also converted to equivalent trapezoids and the figure cut into wedges by the intersecting plane $c\ d\ f\ e$. Blocks *A* and *H*, Fig. IX, also illustrate this case, the method of equivalent figures being used for Block *A*.

In wedge measurements the average value is calculated by multiplying the total pay area of each section by its value and dividing the sum of the products by the sum of the areas.

In irregular bodies blocks are usually found with two parallel sections, but at times peculiar and more difficult problems are presented. The section planes are occasionally at an acute angle to each other, and while the method of case III will generally apply, no rule can be given when each section shows several irregular pay areas. For such problems special expedients may always be devised. Masses cut by test pits or bore holes have their volume measured as explained by Fig. XIII.



In practice blocks are often found with their contents partly stoped out, offering problems more complicated than the typical cases described. Additional planes of section are usually afforded by such stopes, and it is generally necessary to divide the block contents into several parts, each of which is measured separately. In such cases there is no difficulty in applying the principles already illustrated.

(*To be Continued.*)

The Lick Observatory.

Herewith we introduce a feature in illustration which for the moment, at least, lifts the thought away from the earth. And where should it go but to the stars, or beyond them? Ultra-stellar considerations are out of our field, consequently we stop at the boundaries of the vault of blue and depict California's greatest star work, the Lick Observatory, on Mount Hamilton, near San Jose. This institution is the Astronomical Department of the University of California, and was established by bequest of the late James Lick, whose estate yielded $700,000 for the creation of this great establishment for advanced research and higher education. At the time of its construction its telescope, with 36 inches breadth of object glass, was the greatest achievement of the lens makers and the most powerful instrument of its class in the world.

Californians have taken the greatest interest in

VIEWS OF THE LICK OBSERVATORY AND ITS ENVIRONMENT.

the Lick Observatory ever since the first announcement of Mr. Lick's provision for it, and that was twenty-two years ago, or thirteen years before the ponderous sky-piercer reached the mountain top in 1886. When the summit of Mt. Hamilton was chosen, because of its elevation and its large percentage of unobstructed atmosphere, Santa Clara county evinced a welcome for the establishment, and this took tangible form in an expenditure by the county of $80,000 in the construction of a fine roadway from San Jose to the summit which lies twenty-eight miles by road and eighteen miles in a direct line from the city. This road is almost as notable in its way as is the Observatory in its line of achievement. It is said by travelers to be the most beautiful mountain road in the world.

The photographs used in the engraving show a glimpse of the road, the chief elevation of the observatory and the great dome, the immense tube and fittings of the telescope and one of the views of the moon taken with the great lens. The work already done by the astronomers during the short life of the observatory is a rich warrant for the use which Mr. Lick chose for his money. It has greatly added to the sum of human knowledge and its career is only at its beginning. In the great stone pier which supports the telescope is the tomb of James Lick, and his mortal remains rest there most fittingly beneath this forceful agency for human advancement which he generously brought into being.

Scientific Progress.

New Treatment for Spent Oil Wells.

Wheu an oil well ceases to be productive the operator often explodes a quantity of nitro-glycerine at the bottom of the bore. The adjacent rock is thus shattered, and sometimes the flow is increased in consequence. An eutirely new method of treatment of such wells has been attempted recently near Lima, Ohio, by two men whose names are not given in the account at hand. This plan is to force a mixture of hydrochloric acid and water dowu the well and out into the crevices and crannies through which the oil might he expected to drain. Petroleum has, in this country at least, been found only in one particular kind of rock, a sort of limestone, upou which hydrochloric acid has a highly destructive effect. Under the corrosive action of the injected fluid the stone turns into carhonic acid gas and chloride of calcium, which latter is readily dissolved into water aud can be pumped out. The gas escapes spontaneously when the opportunity is afforded. In a well on the Crossley farm a pressure of 800 or 900 pounds too the square inch is said to have been resorted to in forcing the mixture into the rock. At first the amount which would enter was small, hut hy degrees the passages were enlarged and the quantity increased. The Ciucinnati *Enquirer*, which tells the story, says that sixty-five harrels of acid were used on the well in question. The hourly output just hefore the experiment had fallen off to three barrels, but this was increased to ten harrels immediately after the acid had been tried, and for forty days the supply has continued at that rate.

PROF. DEWAR says that oxygen is highly phosphorescent; that under certain conditions oxygen will give off a steady light. This is a suggestion as to the origin and nature of light. The proportion of oxygen increases nearer the earth's surface, and so does the iutensity of light. As we ascend in the atmosphere, light and the proportion of oxygen to other gases decrease in nearly the same ratio. The force which radiates from the sun in straight lines comes in contact with the oxygen of our atmosphere; and it is argued this combined action ignites the carbon gasses, producing light. This subject is not yet fully understood, hut investigators are pushing their work, and it may yet be demonstrated that light originates in our atmosphere and does not come from the sun; that force comes from the sun, and that force wakes light hy hurning the gases within our atmosphere.

A SIMPLE TEST for sewage contamination of water is to add four drops of permanganate of potash solution to a glass of the water. After standing two hours, the rose color imparted by the permangauate will have changed to a dull yellow if decomposing organic matter is present in a dangerous amount, and completely disappear in time if the decomposed organic matter is in very large quantity. If the proportion of impurity is small, the rose color may fade only slightiy. A good method of determining the quality of drinking water is to dissolve twelve grains of caustic potash and three grains of permanganate in au ounce of distilled water, and add one or two drops of this solution to a glass of the water. If a decided color is imparted, the water may be used, but it should be rejected as prohahly dangerous if the color immediately disappears.

A STRANGELY neglected fact of much importance has heen brought to notice by some recent experiments of Dr. Breslauer. It was found by Koch some fourteen years ago that the autiseptic properties credited "carbolized oil," or carholic acid in combination with olive oil, are lacking, yet the matter has received very little attention. Dr. Breslauer has now reported an exhaustive examination of various disinfectants, such as carholic acid, corrosive suhlimate, boric acid, nitrate of silver, etc., in combination with oil, vaseline, fat, lanolin anhydricum, lanolin, and unquentum leniens. The degree of antiseptic power proves to be remarkahly influenced by the diluent employed, and in all cases the hest antiseptic results were ohtained with disiufectants in comhination with lanolin or unquentum leniens. In experiments, for instance, with five per cent of carholic acid in various substances, it was found that the microhe of hoils survived immersion in carbolized oil for three days, in carholized vaseline one day, in fat four hours, in lanolin anhydricum two hours, in lanolin thirty minutes, and in unguentum leniens twenty minutes. Similar results were obtained with other bacteria and other disiufectants. It appears, therefore, that in ointments the disinfectant selected should be used in combination with lanolin or unquentum leniens instead of with oil, vaseline or other fats.

ACCORDING to investigations made hy Heinrich Mayr, there exists a very important law which will enahle a microscopist to tell at a glance the difference between heart wood and sap wood, only the former being fit, of course, for building purposes and to stand the influences of the weather, while sap wood rapidly decays, though often used hy unscrupulous builders. An examination of the resiuiferous ducts, says Mayr, will instantly show the difference. During the process of transition of the sap wood into heart wood, all these resiniferous ducts hecome closed hy the expansion of the cells surrounding them, a process which can he discerned unmistakahly even in the smallest piece of any wood from a conifer, a similar process taking place in the growth of the bark also.

EXPERTS in weather science have long wanted to ohtain indications of the temperature and pressure at an elevatiou of several miles. Professor Willis L. Moore, the new Chief of the United States Weather Bureau, has invented a machine for this purpose, which will be a comhination of kite and halloon, and make automatic records at an elevation of three miles, and telegraph them down to the earth, so that immediate use can he made of the figures for forecasting. Of course, the machine will he anchored, so that it cannot float away.

A STAR, says Sir Robert S. Bell, is a mass of matter heated to such an extent that its effulgence is perceived far and wide. But this heated condition is exceptional, and, though it douhtless lasts millions of years, the temperature must finally sink to that of space, where it will remain through all eternity, unless again kindled by some accident into temporary luminosity. The normal and ordinary state of all the matter of space is cold and non-luminous, and therefore invisible to us.

HELMHOLTZ has attributed cirrus clouds to air waves produced when one stratum of air glides over another of different temperature and density, the lower one being nearly saturated with aqueous vapor. The wave crests hecome centers of condensation, in consequence of diminished pressure, and appear as clouds, while the depressions form transparent interspaces. Ou this theory a "mackerel sky" is produced when two series of waves cross.

THE London *Mining Journal* says a gold medal or a premium of 150 florins is being offered by the Dutch Society of Science, at Haarlem, for a paper on the equilihrium phenomena of one or more alloys of two or three metals, ranging from the melting point of the metal most difficult to fuse to the lowest temperature at which the alloy will continue to remaiu in a liquid state.

MORTAR of brickdust and quicklime is now recommended as an excellent and durable substitute for hydraulic cement.

Mechanical Progress.

Unnecessary Refinement in Machine Work.

One of the most dangerous men in an engineering establishment that intends to make money is the fine mechanic who never knows where to stop putting on fine work. Such a man, left to himself, would scrape the bottom of an engine hed plate dead true, nickel-plate every casting and put a micrometer caliper on every piece in the engine. At the head of an establishment such a man would mean financial ruin. The difference hetween a husiness success and a business failure very often means knowing where to stop mechanical perfection. It ought to be an axiom in every establishment not to expend an unnecessary stroke on any piece of work. The fine work must stop short precisely at the point heyond which it is no longer needed. All this, of course, is easily said; hut when a man has the moral courage to have this done, and to so regulate an establishment that this is practically accomplished on every machine, he becomes simply invaluahle. Some of the hest business successes have heen made hy men who had the courage to put the finest of work, fair work and common work all on the same piece of machinery. To know when and where to apply fine workmanship, it is necessary not only to consider the machine in itself and its workings, but also to consider it as a merchantable article, subject to laws of trade, and to he treated as merchandise pure and simple. This way of looking at a machine is not only hest for the producer, hut for the buyer also. It may he a pleasure to the purchaser to know that every leg of his big press, for example, is interchangeahle and is fitted in place with scraped joints and polished bolts, hut no manufacturer could afford to put such work on to the machine at the market rate, and the purchaser again could not afford to use such a press if he had to pay what it would actually cost. In short, the finest work on machines should he expended only when it is needed. — Cassier's Magazine for November.

Making Tubing.

One of the most important parts of the hicycle, because the most in evidence, is the tubing. The manufacture of tuhing is now carried on to a large extent in this country, although it is but recently that the home production has reached a stage of perfection where it could successfully compete with that of the English concerns.

There are a number of methods of making tubing, but the one mostly in vogue at present is the cold-drawn process; it is of this style of tubing that all the high-grade machines are at present heing made. The machinery required is ponderous, and the power required to draw out a piece of steel without heating it is another exhibition of the perfection of modern machinery.

There are a number of variations to the method employed, one of which consists in taking a piece of steel in the shape of a har or ingot. This is bored through the center. It is then passed through a die, after which it is heated and treated to a hath in a secret preparation which removes the temper that the drawing process imparts. This is repeated a numher of times, and each die used is smaller than its predecessor, with the result that the tube grows smaller and longer. This is continued until the tube is the right diameter and gauge.

A MEANS of increasing the illuminating power of gas ahout fifteen times is claimed hy M. Denayrouze, a French physicist. A spherical metallic body and a mantle capahle of being raised to incandescence are included in the upper part of the lamp, and in the body is fixed a tiny motor, which works a ventilator and which receives current from a couple of small accumulators. The electrical energy required is said to be only one-third volt and one-tenth ampere, and this is sufficient to force air through the mantle and give the flame remarkahle hrilliancy. Lamps of 800 candle power have heen made.

A Big Dredge.

Linden W. Bates has completed at Cairo, Ill., the largest hydraulic suction dredge in the world, built for the government to be used in the work of improving the Mississippi river. Work was commenced on the contract in February and several hundred men were employed. It is designed to cut channels, and will wade through sand bars at the rate of ten feet advance every minute, cutting a swath sixty feet wide and six feet deep. This means that it will handle 3000 cuhic yards of material every hour. Its pumping capacity is 6,000,000 gallons of water an hour. Some idea of its size may be gained from the following tahle of weights and measurements:

Length of hull over all	172 feet
Width of hull	40 feet
Depth of hull amidship	7 feet 2 inches
Height of engine room	24 feet
Estimated weight of empty hull	310 tons
Estimated weight of machinery	800 tons
Estimated weight of fuel	90 tons
Total weight	1200 tons
Total engine power	3000 horse power

The immense power necessary to operate the great pumps is furnished by twin triple-expansion 1200-horse power engines with four cylinders, each capable of 200 revolutions a minute. Each pump has a 36-inch suction pipe which, with the ladders and machinery necessary to operate them, weigh ahout ninety tons. Engineers are interested in the test soon to he made.

AN interesting installation of gas engines—the first of the kind—has hecn made at Sunderland, England. Several Tangye engines have been coupled direct, without intervening helting or gearing, to centrifugal pumps for emptyiug a graving dock, and the results are said to have been thus far highly satisfactory. Each pump, of which there are several, can discharge hourly 2600 tons of water, and each engine indicates 120 horse power. They have a self-starting attachment.

AN ingenious method of welding lead has heen recently devised in France hy M. Blondel. The surfaces to be joined are carefully cleaned, and hetween them is placed a thin layer of lead amalgam. On passing an ordinary soldering iron along the line of junction the mercury of the amalgam is vaporized, and the lead, set free in an exceedingly finely-divided state, fuses and unites the two surfaces together.

THE casting of a mammoth church bell at the Buckeye Bell Foundry in Cincinnati, O., is completed. The bell is larger than the thirteen and a half ton bell at Montreal, up to this time the greatest on the continent. In ornamentation it surpasses all bells in existence, and is the largest swinging bell in the world. It will supplement a chime of forty bells in St. Frances de Sales church.

A STEAM PIPE capahle of resisting very high pressure has been patented hy a Glasgow engineer. It consists of a copper tuhe around which is wound steel wire, especial care being taken to insure perfect contact hetween the two metals. Soldering is effected hy immersing the whole in a fusible alloy whose melting point is ahove the temperature of the superheated steam.

A NEW smoke-consuming device for furnaces is an attachment automatically feeding a quantity of oil to the fire when fuel is added. As the oil hurns, it consumes the smoke, the injection of oil being adjusted at will to the amount of smoke expected at each fresh charge of fuel.

Two French experimenters have caused argon and helium to comhine with magnesium vapor under the prolonged action of the silent electric discharge. Argon is united with platinum under similar conditions.

Electrical Progress.

The Propagation of the Magnetism of Iron.

By W. PECKERT.

When a long straight iron bar is excited by a magnetizing coil situated at the center, the lines of force, all of which pass through the coil, do not keep in the iron up to its extreme end, but emerge into the air at all points along its length, so that the induction in the bar falls off continuously as the distance from the central source of magnetization is increased. With a periodically varying magnetizing force the same effect is produced, and, moreover, the corresponding periodic changes in the induction induce eddy currents in the iron. These cause a lag in the phase of the induction which increases as the end of the bar is approached.

Experimental proof of this was carried out on rods of about one meter length of wrought and cast iron, and on a large bundle of soft iron wires of 1 mm. diameter. The induction at various points was measured by search coils placed at intervals on the bar, and readings of the instantaneous values of the induction were taken through a complete period for each coil. The readings were obtained by means of a contact maker fixed on the alternating current dynamo used for exciting the magnetizing coil, the momentary currents being indicated by a Wiedemann galvanometer. Magnetomotive forces of 288 and 1306 ampere turns were used.

The curves of induced E. M. F. obtained from all three samples show a shift of phase which increases with the distance of the search coil from the center of the bar, both at the lower and at the higher values of the induction. The curves are not symmetrical with the zero axis, the difference being attributed to residual magnetism. There is no marked difference between the changes of phase produced in the solid and in the laminated specimens, the amount of shift not being sufficiently clearly defined to show any distinct difference. The magnitude of the deflections continuously falls off along the bar, showing the diminution in the induction.

Doubtful Electrical Projects.

The last article written by the late F. L. Pope, whose recent tragic death is fresh in the minds of electricians, in discussing a certain electrical project, says that all is not gold that glitters in electrical schemes, as in all others. People have now such faith in electricity that it is sometimes hard to persuade them that an electrical industrial application may possibly cost more than it is worth. The project in question involved the supplying of the manufacturers of a town with power from a distant lake. The circular of the project stated there is not the slightest question that the supply of water would be ample for the scheme as outlined, and that it is sufficient to furnish "at a very low estimate, 2000-horse power night and day during the entire year." Upon the basis that it costs $40 to produce a horse power by steam in the town, which is not an unreasonable figure, it is assumed that $80,000 worth of power a year can be delivered within a radius of ten miles of the town at an annual cost, inclusive of interest, depreciation and operating expenses, not to exceed $10,000. These figures, which are attractive enough on paper, will not bear critical investigation and for the benefit of those communities which may be contemplating the utilization of neighboring water powers, Mr. Pope made a concise and convincing analysis of the scheme. The proposed water supply has an area of 325 acres. The watershed does not exceed four square miles. The mean rainfall in that part of the country is about 37.5 inches per annum; in a dry year about 80 per cent of this, or 30 inches. Not more than 75 per cent of this finds its way into the lake; the rest remains in the porous soil, or is evaporated. This leaves 22.5 inches, or 1.87 feet, which, falling upon four square miles of watershed would yield, in round numbers, 198,500,000 cubic feet of water, equal to 337 cubic feet per minute. The 20-inch steel pipe which carries the water will give a head of 600 feet, which would give 409-horse power net. Assuming 80 per cent efficiency for the water wheel, 90 per cent for the electric generator and 90 per cent for the distributing system, there remains not 2000 but 262-horse power available for industrial purposes. Whether it is worth while to expend $50,000 or $60,000 to secure this amount of power is, according to Mr. Pope, "a question which should be best answered by those interested."

Electric Test for Jewels.

A correspondent writes to the *Electrical Engineer* as follows: "The other day a friend of mine, who is a jeweler, asked me jokingly whether I could rig up an electric shock producing device for testing diamonds and the detection of sham or paste diamonds. After thinking the matter over, I presented him, a couple of weeks later, with the following apparatus, to his entire satisfaction: To the spindle of a small electric motor is attached a small thin disc made of aluminum and placed in a horizontal position. A clamp with a small flat spring, and provided with an adjustable screw, holds fast a ring or any other article with the real or sham "brilliant." The ring, etc., is moistened, and slowly moved by hand toward the disc, driven at high speed by the motor, thus applying, so to speak, a break to the motion of the disc. The idea is based on the fact that if a sharp piece of aluminum be rubbed on moistened glass, brilliant metallic markings result on the glass diamonds but not on those which are genuine. If some metallic marks are found on the so-called diamond, then, of course, it is not a genuine article; otherwise, it is a real diamond of the first water."

UNDER date of October 18th, *Industries and Iron* (London) says: The extensive plans now debating for the establishment of railways in South Africa should arouse the keenest attention in the mother country. As is well known, a considerable portion of the South African gold-mining industry is represented by California miners, and in consequence of this and other circumstances, South Africa has come to be a quarter to which American engineering firms are prepared to devote both capital and enterprise in a large degree. We reported last week that the electric lighting of Buluwayo had been secured on behalf of the General Electric Company, which, contrary to the suppositions expressed by some of the American organs, appears to be employed with other things besides placing its stock with misguided investors. For plant of the proper type there is a huge market just opening in this developing country; but without personal acquaintance being made by proper representatives with local requirements, it is almost idle to attempt to compete with those who have made it their business to accurately gauge the exceptional exigencies which are imposed by the characteristics of the country.

EMILE BERLINER, in a recent interview, said: "The next step in the development of the telephone will enable a number of persons to talk over the same wire simultaneously, and by this means the cost of long-distance telephoning will be much reduced. Experts are working on this problem now. The Bell company spends $100,000 a year for experiments. In the Boston laboratory thirty experts are constantly engaged in working on telephone problems. An invention that is even now approaching perfection is the theatrophone. This contrivance will make it possible for people to step into a public office and listen to grand opera, comic opera, or the songs and funny dialogues of a variety show."

Practical Information.

Metals and Minerals.

Professor Skidmore of Philadelphia, in a course of laboratory lessons to supervising principals and teachers of the Philadelphia public schools, took up the subject of metals recently. In the course of his lecture he made some interesting remarks in regard to the distinction between minerals and metals. It is not possible, he observed, to define exactly what a metal is, yet there is little liability of mistake in distinguishing a metal from a nonmetal. The metallic properties of luster, toughness, fusibility, opaqueness, conductivity and rust may be possessed separately by nonmetals, but they are not associated as they are with metals. Most metals may be bent, twisted, drawn and hammered to an extent far beyond what any mineral not a metal could endure.

Taking up the matter of the rusts of different metals, he showed by a series of interesting experiments that sodium, potassium, lithium and, in a lesser degree, calcium, strontium and barium rust instantly when exposed to moist air, their white rusts quickly dissolving in water and forming alkalies. Other experiments demonstrated the fact that another group of metals, in which are zinc, lead, magnesium and antimony, have white rusts which are not soluble in water. These rusts form a thin adherent coating, which only half conceals the metal and gives to it a dull, tarnished appearance. It was shown that at higher temperatures than the ordinary, and especially if the metals are finely divided, the chemical energy of rusting is so great that the metals burn with a vivid light and emit a dense white smoke. The permanency of these rusts and their protective character are utilized in white paints.

Professor Skidmore then directed attention to a third group of metals, which includes those which have dark or colored rusts, as with copper, iron and silver. A series of experiments followed to show how these rusts were formed, and the changes which iron undergoes in appearance in the tempering process were carefully noted. Attention was directed, finally, to the fourth group of metals, which never rust. These are gold and platinum, and it was noted that they are also the metals which are found as metals in the earth, and not as ores from which the metal must be manufactured. In the case of the other metals it is an advantage that they are found in the rust or ore condition, as they can be manufactured much more easily than they could be cut from ledges of the pure metal.

A Convenient Rule.

IT will be interesting, says the *Iron Trade*, to those who have anything to do with sheet iron, boiler plate or similar material to have an easily remembered rule for finding the weight per square foot of material they are working with. The fact that a square foot of iron plate one-eighth of an inch thick weighs almost exactly five pounds, forms at once a basis for a very simple and easy rule. As a square foot of iron one-eighth of an inch thick weighs five pounds, a square foot of one-fourth inch iron will weigh ten pounds, and we can say that the area of any sheet iron, or iron plate, in square feet, multiplied by the thickness in one-eighths and multiplied by five, will give the weight of the piece. There is a piece of tank iron five-sixteenths of an inch thick, three feet wide and five feet long; how much does it weigh? The area will be three feet by five feet, or fifteen square feet. Now, how many eighths in five-sixteenths of an inch? Since one-eighth of an inch equals two-sixteenths of an inch, and two is contained in five two and a half times, we say five-sixteenths of an inch equals two and one-half eighths, or two and one-half times five pounds equals twelve and one-half pounds per square foot; and as there are fifteen square feet, we have fifteen feet by twelve and one-half feet, which equals 187.5 feet. Where the thickness is even eighths of one inch, it is much simpler, but even this is not a hard thing to do, as shown. If it is desired to use this rule for other than iron, we simply find the difference between the weights of the two metals per cubic inch and find what a square foot one-eighth of an inch thick will weigh, then work as shown above.

Value of Carcass of a Dead Horse.

The horse carcass is of more present value for its chemical products than the living animal. The carcass is first relieved of its hair by a shaving process. The tail and mane are especially valuable; from these is made haircloth. The short hair taken from the hide is used for stuffing cushions and horse collars.

The hide is valuable; the leather known as cordovan is made from the skin over the rump and used in the manufacture of high-class hunting and wading boots, as it can be made impervious to water. The other leather is soft and is used mostly for slippers and heavy driving gloves. The hoofs are boiled to extract the oil; the horny substance is shipped to the manufactories of combs and what are known as Mikado goods.

The carcass is cooked by steam at a pressure of three atmospheres. This separates the flesh from the bones. The leg bones are very hard and white, and are used for handles of pocket and table cutlery. The ribs and head are burned to make bone-black after they have been treated for the glue that is in them. In the calcining of these bones the vapors arising are condensed and form the chief source of carbonate of ammonia, which constitutes the base of nearly all ammoniacal salts. There is an animal oil yielded in the cooking process which is a deadly poison and enters into the composition of many insecticides and vermifuges.

The bones to make glue are dissolved in muriatic acid, dissolved in boiling water, cast into squares and dried on nets. The phosphate of lime, acted upon by sulphuric acid and calcined with carbon, produces phosphorus for lucifer matches. The remaining flesh is distilled to obtain carbonate of ammonia. The resulting mass is pounded up with potash and then mixed with old nails and iron of every description. The whole is calcined and yields yellow crystals of prussiate of potash, with which tissues are dyed a Prussian blue and iron transformed into steel. It also forms cyanide of potassium and prussic acid.

Suggestion for Clear Cistern Water.

TO THE EDITOR:—Having noticed an inquiry on how to filter rain water into a cistern to take the smoky taste out of it and make it good drinking water, I would suggest having a cut-off in the pipe leading to the cistern and be sure to have this cut-off open to carry away all soot or dust that may accumulate on the roof before each rain. When the roof is washed off well, turn the cut-off on to the cistern.

In the cistern build a filter of brick, in the shape of half a pear, building it against the side of the cistern. This filter should be built of bright red brick, laid flatways in good lime mortar. The outside and inside of the brick should be kept clear of mortar. Build in a half circle, about two feet wide at the center of the circle and close in at the top about three feet high. Place the pump pipe down through the wall of the filter to about one and one-half or two inches from the bottom, and close the pipe tight in the hole and the water will go through the four inches of brick faster than it can be pumped out. I know of no better way to purify water than to pass it through four inches of brick. If any dirt is in the water, it is left on the outside of the filter.

A. C. THOMSON.

Duarte, Los Angeles Co.

Mining Summary.

CALIFORNIA.

Amador.

THE FOGUS.—*Ledger:* The original owners of the Fogus mine in Volcano district sold it to Lyle and others who organized the Fogus Mining Company of California. They defaulted on their taxes, and H. D. Emerson bought the property in, and later sold it to Wolf & Camphell. These people put up a mill and now have several liens and attachments ou the property resulting from their failure to pay for timher and material. Lately the Fogus Gold Mining Company of Nevada was organized, and the interest of the California Fogus Company transferred to them. As successors in interest of the Fogus Company of California, they commenced suit in the United States Court for possession of the property. The result of the suit has been the selling of the interests held hy Wolf & Camphell to the Fogus Company of Nevada, which by the way, carries with it the dismissal of the suits in the United States Court.

ONE THOUSAND FEET DEEP.—*Dispatch:* The shaft at the Argonaut mine has now nearly reached the 1000 foot level, and the work is still progressing vigorously, with flattering prospects ahead.

Butte.

THE GOLDEN SUMMIT MINE.—This mine is 6309 feet ahove sea level. Snow last winter fell to the depth of 32 feet. The main shaft is down 200 feet. On the first level there is a tunnel running east 300 feet and one west 450 feet. On the second level the side stopes are 180 feet. The tramway, walk to hoarding house and hoist are all protected with strong snow sheds. For nearly three months last winter the light of day did not penetrate the hoarding house and candles were hurned both day and night. The land comprises 320 acres of patented land and 320 acres covered by location. Forty-five men work in the mill and mine and ahout 20 more are cutting and hauling wood. The company is getting in 3000 cords of wood for winter. The mill contains 10 stamps. Two engines are run, one at the mill and the other at the hoist. Water is supplied from three ravines and it is carried from two tower houses in iron pipes to the works. C. G. Kane is superintendent and has charge of the underground work. It is thought that within a few months the mill will have 20 stamps additional.

GOLDEN FEATHER. — The following cablegram was recently received by the London owners from the company's general manager at Oroville.—"Reached hottom gravels ahout Septemher 29; prospecting very good; ground rapidly changed into rock-filled gorge. Got through this on Octoher 9. Now have good prospects immediately ahead. Clean-up will amount to ahout $4000 in working ahove-mentioned very bad ground."

Calaveras.

AT CARSON HILL.—*Voice:* It is said that the Melones mine at Carson Hill will start up soon. It is owned hy James W. Grayson of Oakland.

At the Iron Rock mine at Carson Hill, bonded by G. W. McNear, the tunnel has heen run in 165 feet, and they are now crosscutting the vein.

The Carson mine, formerly the South Carolina, has gone about 120 feet on its 150 foot tunnel. Martin of the Rawhide, who is doing the work, is running three eight-hour shifts night and day.

MINE BONDED. — *Chronicle:* The Mineral King silver mine, twelve miles from West Point, has heen placed on the London market, and a sale is now pending; $100,000 is the price asked.

PEEK RANCH MINE. — Work on the Peek Ranch mine is progressing steadily. The gravel encountered is of a hard cementy nature, and powder has to he used in breaking it up so that it will wash. One hundred and fifty inches of water is at present being used.

GENERAL NOTES.—*Echo*: Gilman & Mercer are finding good ore in their mine at Smith's Flat.

The erection of the addition to the mill at the Gold Hill mine is now under way.

The work of opening up the Bovee mine continues, and in a short time everything will he in readiness for stoping.

James G. Maltman is engaged in reopening the Lightner mine in this town. Several men are now at work on the property.

The Utica Co.'s chlorine works are running to their full capacity day and night roasting sulphurets from the company's numerous mines.

The Utica Company's mines—the Utica, the Stickles, the Madison and the Gold Cliff—are all running in first-class shape and yielding big dividends.

Work is progressing at the Pure Quill mine, and everything ahout the place is heing put in shape preparatory to the heginning of operations for the winter.

There is a prospect of the Calaveras Consolidated mine at Rohinson's Ferry starting up before long. Mr. E. K. Stevenot has the property under his control at present.

The huilding of the new mill on the Tulloch mine at Alhany Flat is going on briskly. There are 700 tons of ore now on the dump that will he put through the mill as soon as it is completed. Work is going on in the mine day and night.

Inyo.

ONLY A RUMOR.—*Register:* It is reported that a forty-stamp mill will he huilt at Copper Mountain ahove Mono Lake. It is understood that the owners are negotiating with an Inyo mill owner for 200,000 feet of lumher.

OPERATIONS AT MAMMOTH. — At Mammoth, the mill started last week. The ditch has een completed from Lake Mary. and everything is now ready to run. The tramway is ahout a third completed.

Lassen.

ACTIVITY AT HAYDEN HILL.—Beiber *Gazette:* That there is considerahle activity on Hayden Hill is evident from the numher of mines which are now heing worked there. The list embraces the following claims: Golden Eagle, Evening Star, Brush Hill, Mount Hope, Hayseed, Blue Bell, Big Tunnel, and the resuming of work in the Juniper mine is also in contemplation.

Los Angeles.

THE BIG HORN. — *Times:* F. V. Layton, until recently general manager of a large St. Louis syndicate with a paid-up capital at $3,-000,000, operating a large silver mine in Sonora, Mexico, is now manager of the Big Horu Gold Mining Company of this city. It is capitalized for $2,000,000 and owned hy Senator S. M. White, Judge E. M. Ross, L. W. Blinn, J. A. Graves and a few others, all of Los Angeles. He is here gathering good and experienced miners to take up to the Big Horn, as Mr. Layton is doubling the force and pushing the work as fast as possihle on the mine, as well as pushing the construction of a road to the mine. The mine is developed to a depth of 300 feet and has heen crosscut in several places for a distance of some 1200 feet in length, showing a hody of gold ore of over fifty feet in width hetween walls, containing two million tons valued an over $8,000,000. November 1, 1896, will see a mill of one hundred stamps, capahle of crushing 300 tons per day, in full blast on the mine and giving employment to over 250 men, who will all look to Los Angeles for a market. The mill and other machinery will he run hy waterpower, as there is over 600 horse-power to he had within one mile of the mine.

Madera.

AT COARSE GOLD.—*Mercury*: R. Taylor and W. A. Phipps of San Jose have purchased the Santa Rosa mine, owned hy Francis Pero, at Coarse Gold. Mr. Taylor was formerly foreman of the Zehra mine and at one time worked the Santa Rosa mine. There are fourteen tons of ore on the dump, which assayed $35 to the ton. Some of the ore assayed as much as $1000 to the ton. They intend to put in a ten-stamp mill.

Mariposa.

THE HITE MINE.—The Hite mine is now free of water, the shaft is heing sunk deeper and the mill will soon he running.

Mendocino.

A COPPER PROCESS.—Of the W. P. Thomas copper location, near Round Valley, F. C. Mathyas, field assistant to the State Mineralogist, says: "The samples of sulphide ore I have examined from the W. P. Thomas location are excellent, and could he profitably worked at very little expense hy the lixiviation process, now heing used to great advantage in the Campo Seco mine in Calaveras county. By this process it is necessary to pile the ores in piles of 100x100 feet square. When ignited, the sulphur in the rock keeps up the fire, the halance heing converted into sulphate of copper. When the fire has died out water is thrown on. It percolates through and dissolves the bluestone, which is drained off in wooden troughs. Scrap iron or scrap tin is then thrown in and that deposits the copper in a metallic state. In this form the metal is called copper cement, and is either sold as paint or else melted in crucihles and converted into pigs."

Nevada.

IT PAID WELL.—*Union:* Nearly three tons of ore from the Federal Loan mine were sent to the Selhy Smelting Works at Sau Francisco and the returns are very gratifying, the ore yielding nearly $200 per ton ahove all expenses. This is indeed encouraging and proves that the Federal Loan will he a great mine some day. The work of drifting is now heing pursued.

DRIFTS AND CROSSCUTS.—*Telegraph:* It has long been thought that the Empire mine had more length of drifts and crosscuts than any other mine in the district. It is not so, however. The North Star mine has fully twelve miles of drifts and crosscuts underneath its surface and a gentleman to-day informed us that he believed an accurate measurement would show up fifteen miles of such. There are certainly twelve miles.

THE MOUNTAINEER.—Superintendent Dennis has pumped out ahout a mile of levels and drifts in the Mountaineer mine at Nevada City, says the *Herald*, and cannot see bottom yet. There is an immense quantity of water there.

Placer.

THE GRAY EAGLE MINE.—*Republican:* The Gray Eagle mine, of the Forest Hill Divide, is proving richer than the most sanguine expectations of its owners. The gravel runs as high as $400 per car and there is a prospect of its continuing throughout the channel at this high figure.

San Bernardino.

A NEW DISTRICT.—A. J. Hellerman who has heen prospecting throughout southern California, Arizona and southern Nevada has made several locations in a district twenty-five miles northeast from the Desert Queen. The White Star and the Ivanhoe are the two locations in which he has most confidence. On the former he has a shaft 100 feet in depth, and drifted on the ledge forty-five feet. The free milling ore yields an average of $35 a ton.

On the Ivanhoe a shaft has heen sunk sixty feet, from which drifts have heen run about thirty feet in either direction. The ledge is wider than the White Star—about thirty inches—and is free milling ore, averaging so far as tested $48.50 a ton.

Plumas.

MORNING STAR MINE. — *National-Bulletin:* E. C. Rohinson at Granite Basin, on the Morning Star quartz mine, has a shaft seventy feet on the wall of the ledge. It is the intention to sink the shaft fifty feet farther. In free gold, the quartz mills from $6 to $7 per ton. On an average, it contains five per cent of sulphurets, some running as high as sixty per cent; the ore assays from $24.70 to $803.41 and the sulphurets $1778 per ton. To save the gold, he will put in a two ton plant chlorination works next spring.

DIAMOND MOUNTAIN.—The 10-stamp mill at the Lone Pine mine will start up next week.

NELSON CREEK.—*National-Bulletin*: Fish & Co. have put in nearly a thousand feet of six-foot flume. This season they will run a large tract to top tailings down to flume and work a large portion of the creek hed.

San Diego.

JULIAN DISTRICT.

THE ELEBADA.—The owners of the Elehada are working two shifts. The main shaft is down 110 feet. Levels in hoth directions have heen run part way down the shaft and also at the hottom aggregating 180 feet. A hlock twenty feet square was recently stoped out which yielded 100 tons of milling ore.

TO PROSPECT ON THE DESERT.—*Times-Index:* There are more prospectors going out on the desert at the present time than during any corresponding period of previous years. Gold Rock mining camp (Hedges postoffice), and neighboring localities are enjoying quite a boom. Prospectors are purchasing tickets to all points along the railroad between Banning and Yuma.

IN THE GAVILAN COUNTRY. — *Union:* The English company working on the San Jacinto grant in the Gavilan country, who have been prospecting and crosscutting the country thereabouts for several months past, have discovered a number of fine ledges, and on some of them sinking has been commenced. Much of the ore is rich in character, some of it running into the huudreds per ton. This is being sacked and put in houses built for the purpose. The company is composed of a number of rich Englishmen, and it is their intention to develop their estate to the amount of $100,000 before any machinery is put up. When they are satisfied that they have some good mines, they will put in a larger plant than there is in southern California.

Shasta.

HARRISON GULCH.—The Anderson *News* says that Harrison gulch, in western Shasta, is a lively camp, over 100 men being at work there. Lee Powers is putting up a hoarding house, and his sawmill at Wildwood is running day and night to supply lumber for the camp. When the Hay Fork road is completed the new mines will make trade for Anderson. Fowler and Conant are opening some promising mining property there.

MAY RESULT FAVORABLY.—*Democrat*: Rumors are afloat that negotiations are afoot for the purchase of the Stowell group of claims, north of Iron Mountain, and considered hy mining men to be as extensive a property as Iron Mountain. J. T. Hill of Redding, acting for a rich New York company, recently inspected the property and wired a report to headquarters. The mine is an immense one, and will he sold wheu Stowell gets his set price in his hand.

Trinity.

Journal: The Altoona mine at Cinnabar is steadily producing quicksilver, from twenty to twenty-five flasks being the daily output. There are many men employed now but during the winter the force will he reduced. The camp presents a prosperous appearance. General merchandise stores have heen started with stocks of goods needed for the men. A new shaft has been sunk from the present level for sixty-five feet, and the ore is holding its own well; this shaft will he continued 210 feet below the lowest level, which will give a depth of 430 feet. A new furnace will prohably he added in the spring.

NEW RIVER.—*Journal:* Hennessy, Clecker & Crane, who have the R. L. Thomas placer claim leased, are working hy means of a reservoir, which fills only four times a day, making only a run of one and one-third hours. Working to such great disadvantage they cleaned up over $225 after a month's run.

The Hohoken and Granite Slide Mining Company, incorporated, are making preparations for winter, when they expect to work twelve men. They have already expended $7000 on improvements. To make an opening to their hack channel they had to cut a rim of hedrock over forty feet deep and ahout 150 feet long. They have over 12,000 feet of sixteen-inch pipe laid ready for operations, in connection with which they have huilt a reservoir.

W. J. Nichols, owner of the Mason Bar claim, is anxiously waiting for water. He only runs about one hundred days in the year, and although having a very heavy bank to work he never realizes less than from $6 to $10 a day. He has about 1,500 feet of fourteen-inch pipe.

Tuolumne.

A MINE BONDED.—*Leader*: D. B. Warfield has honded his mine in Tuolumne county to W. M. Ferguson, of LaGrange, for a period of one year. Mr. Ferguson, assisted hy San Francisco parties, will put up a mill and proceed to developing the property at once. The mine at one time was a highly paying property hut fire came and swept away a twenty-stamp mill and all accessory huildings hesides four or five other mills in the vicinity. Work was at that time shut down. When Mr. Warfield left Tuolumne county for Oakdale he patented it and the mine has since laid idle. It is situated ten miles southeast of Sonora near the Eureka Consolidated owned hy Hayward & Hobart.

NEVADA.

DISTANCE LENDS ENCHANTMENT. — Miners are leaving Tuscarora in parties hound for DeLamar, Nev., which causes the *Times-Re view* to remark: "We are pleased to see all those who, heing idle, manifest a desire to better their condition, hut it is a conundrum to us why they should jump at a bare possihility of prospecting three or four hundred miles from here while there is plenty of that kind of work to he done at home. Our camp is not half prospected. Verily, distance lends enchantment to the view.

A GOOD PROSPECT.—The Gertie mine owners in Cory district, Esmeralda county, have what may prove a valuable mine. Three men have taken out and sacked twenty-five tons of ore. It is estimated that the ore will mill $75 per ton.

THE CANDELARIA MINES.—Affairs at Candelaria are progressing satisfactorily, and the mines under the management of Colonel W. J. Sutherland will soon again he in active operation. The new plant now heing erected under the Peck patents, for working tailings and low grade ores, will soon be completed, and the English company will he ahle to go ahead on a profitahle hasis, regardless of even still lower prices iu the silver market. Captain Hulse of London, one of the prominent stockholders in the Candelaria companies, is at the mine.

OREGON.

ONE MORE "PROCESS."—N. D. Clarke, of Irma, Curry county, has invented a gold-saving machine and will apply for a patent. He says it will he simple and of unlimited capacity. There will he no mysteries or secret chemicals, hut a practical application of natural laws.

Josephine County.

A PLACER MINE.—W. H. Hampton has a hydraulic mine at Placer, Josephine county, 13 miles north of Grant's Pass, where he has two ditches completed, with an aggregate length of 20 miles, to hring water from Grave creek. The ditches are seven feet wide at the top, four at the bottom, with a depth of three feet. Operations will he carried on through the winter. The company has about 300 acres to work.

UPPER CHETCO MINES.—Chris Russ is one of the locators of the Mayhelle Mining Co.'s group of placer mines on the upper Chetco river, recently incorporated with capital stock of $100,000. The Del Norte *Record* says that this group of placers, according to the report of an expert sent hy Senator Jones to inspect them, is a rich placer. The same claims were located several years ago, hut nothing was done towards their development.

WASHINGTON.

A great deal of work is heing done at the San Poel placer mines on the Columbia, north of Wilhur. The Wilbur *Register* says: Most of the plants are now running day and night shifts, especially to keep the water running over the sluices so that freezing will not interfere with the work. It is expected, if the weather continues fair, that nearly all the work in progress will continue through November.

THE CLEVELAND MINE. — Ten men at the Cleveland mine, in Stevens county, are producing about a ton of 100-ounce ore per day from a ten-foot ledge of silver-lead ore. Some black sulphurets have recently been encountered in the workings. The shaft on the property is 60 feet deep; the best ore comes from nearer the surface.

TIN ORE IN KITSAP COUNTY.—A few months ago there was a report that tin ore similar to that found in Cornwall, England, had been discovered in Kitsap county, thirty miles from Seattle, which ran from three to five per cent in tin. A company was formed with a capital of $2,000,000, called the Cook Kitchell Mining Company. Carl Kleinshmidt, in a report on the property, says: "By rigid and strict economy in all the details the mines may he made productive and self-sustaining, if the superintendent has practical as well as theoretical knowledge of tin mining and reduction." The property consists of twenty-six claims, aggregating 520 acres.

THE OKANOGAN COUNTRY. — *Outlook*: An "iron capping" craze has struck this country, where there is an extensive mineral helt in which iron capping is a characteristic feature of the ledges. This capping, so far as it has been tested, carries hut very little gold, generally assaying from a trace to $5 a ton. On account of their heing so low grade, hut little attention has heretofore heen given to the district and there is not to exceed a ten-foot hole on any of these iron caps. However, since the Tral Creek country, with the same distinctive characteristics, has come into such prominence, our prospectors are heginning to investigate. Those who have heen over the ground are firmly convinced that the mineral helt which is producing such marvelously rich mines at Trail Creek is the same that is found cropping out so prominently in the Sooyoos district. It does not follow, that hecause the Trail Creek mines are rich or carry mineral in paying quantities, the Sooyoos district, in the same mineral zone and possessing similar features of formation and distinct likeness of common characteristics, will also possess the precious metals in equal quantities.

BRITISH COLUMBIA.

A BIG MACHINE.—Since April last there has been in course of construction in Vancouver, B. C., a large mining machine for the B. C. Gold Dredging Company, under the direction of W. A. Shahan, superintendent of the company. The plant is located on a scow 30x100 feet. The cost complete will he about $30,000. Mr. Shahan says the principle on which it is to he worked involves the use of a suction pump and vacuum chambers. Boulders up to twelve inches in diameter will come up through the pipe, but everything down to three inches in diameter will he screened out from the chambers back into the river again. Then, by the use of a suction pump, all the remaining material is carried up on to the grizzly hars, and everything down to pieces

one-quarter of an inch in diameter is then removed and sent down to the river. The residue passes on to the sluice way. The material delivered by the grizzlies passes over a revolving cylinder on an endless apron. Beneath this apron in a water-tight box there are magnets set all the way from where the material will first drop on the apron to a point below where the water and gold sand will naturally flow off. By this means the black sand will be allowed to drop below, where an automatic carrier will pick it up and tote it along to a sack. When a sack is full its weight will cause a bell to ring and the attendant will remove it and put another sack on the rack. The grizzlies will discharge on both sides of the scow, so that there will be two sets of sluice boxes and two of the electro-magnetic black sand catchers. The plant has a capacity of 3500 cubic yards every twenty-four hours. The main driving engine is a steeple compound with a driving capacity of 150 I. H. P. The scow is fitted with wrapping gear, steam windlasses and capstan. It has an electric plant, so that work can be carried on at night as well as by day. A crew of twelve men is sufficient for a 24-hour shift. W. A. Shahan is superintendent of the company, J. E. W. McFarland president, and J. W. Campion secretary. The shareholders of the company recognize their scheme partakes of the nature of a gamble but they think that the odds are on their side.

THE SKY LINE.—Scott McDonald, manager of the Sky Line, at Ainsworth, B. C., is authority for the statement that they had struck twelve feet of ore in the mine which runs 400 ounces in silver. They are now shipping thirteen tons a day to the Pilot Bay smelter. Work will continue at the Pilot Bay smelter all winter.

BONDED TWO MINES.—Marcus Daly, the copper king of Montana, has bonded the Winnipeg mine in Wellington camp for $50,000, and the Calumet for $25,000, five per cent down, and put a force of men at work building a wagon road and erecting buildings. The bonds are not to be redeemed for a year, and the provisions require that the prospects he worked continuously until that time, or the contract is forfeited by the purchaser.

TRAIL CREEK. — *Miner:* The first carload of ore from the Evening Star averages about $50 in gold.

The second payment of $6,000 has been made on the Robt. E. Lee and Maid of Erin claims, the recipients being William Dunn and Michael Sullivan. These claims were discovered last fall and are now bonded for $60,000. A steam hoist, pump and power drills will be put in.

On Wednesday last $40,000 cash was paid on the purchase of the option taken by Messrs. Mason, Hoge and McKinney a month ago for the Trail Mining Company. This secures for the camp a very strong mining company, and ample machinery will be brought in for the company's properties.

THE HORSEFLY HYDRAULIC MINE.—At the Horsefly mine, in charge of J. B. Hobson, formerly of Placer Co., the running expenses are $7,000 a month. Local journals say the mine will pay about $150,000 a year.

ALASKA.

SILVER BOW BASIN.—*Record:* The Juneau Mining and Milling Company has closed down operations for the season, but as early as possible in the spring will start up again and during the summer will greatly increase their capacity for future work.

IDAHO.

RUNNING REGULARLY.—*Avalanche:* Regular shipments of bullion and concentrates are being made from the Trade Dollar and Black Jack mines. The Poorman is also running steadily and profitably.

TWO DAYS' RUN. — Statesman Amos Lee yesterday brought to the city 153 ounces of gold, the result of ten days' run in a five-stamp mill on ore from the Hidden Treasure mine in Neal district.

HIGH VALUE GOLD. — Elmore *Bulletin:* Henry and Charles Meegan were here Monday from their placer diggings on the Snake, after supplies. Under a strata of hard-pan they have found on their claims a layer of gravel remarkably rich in gold that is worth over $19 per ounce.

BOUGHT THE WHOLE PROPERTY.—Wood River *News-Miner:* The deed of E. Tootle and M. A. Reed of Buchanan county, Mo., conveying to the Fortuna Mining Company, a corporation under the laws of New Jersey, the Big Camas No. 2 mine, mill, millsites, the townsite of Doniphan, etc., for a consideration of $212,500 has been filed for record.

BUNKER HILL AND SULLIVAN. — Manager Bradley reports that on October 31st there were 368 men employed at the mine and 48 in and around the concentrator and crusher, the latter being situated near the mine, where the ore receives a preliminary crushing before being sent over the tramway to the concentrator, or 416 men in all. The payroll for thirty days in October amounted to $38,000, and for thirty days in October the average amount of ore mined was 500 tons per day. One day the output was 638 tons. The miners are paid $3, the shovellers $2.50 per day. He says: "There is a common impression that all big mines make big profits, which is a great mistake. We are now paying all we can afford to pay. We have reduced wages one-seventh and hoard one-seventh. The wages we are now paying are better, considering the decline in values all over the land, than the wages that were paid in the palmiest days of the Cœur d'Alenes. The men are glad of an opportunity to work at these wages, and the people of Wardner are more than satisfied."

A PROFITABLE INVESTMENT.—Respecting the placer mine on the Snake river, opposite Barnum island, the Shoshone *Journal* says two years ago Kidder & Graham worked the property, using a rocker, and made good wages. Kidder bought out Graham's interest and then secured a machine from Salt Lake that was guaranteed to raise 100 inches of water. He placed the machinery in position and mined while onlookers laughed, but now it is his turn to smile. During the past three weeks he took out $500, and the mine averages $20 a day. A great many inventions have been placed before the public during the past year or two, all having a new device for saving gold, but after a trial the practical miner resorts to the use of the old burlaps; they save more gold than any of the new fangled contrivances. What is needed to make the miner rich and the inventor independent, is some apparatus that will raise the water of Snake river and place it on the many bars that lay about 20 feet above the river. Give the miner water and he will catch the gold.

MONTANA.

PAID THE MEN.—On Tuesday of last week, says the Basin *Times*, the Basin and Bay State Mining Company paid its employes $20,940.35, being the amount of insurance money received on the Katie works, which were recently destroyed by fire. The men have been kept out of their wages for many months, but they have always been confident that in time they would be paid in full.

THE NEW EVA.—*Western Mining World*: The Longmaids have secured another valuable property in the New Eva mine in the St. Louis district, near Townsend. The price paid for the property is $25,000, one-fourth of which has been paid. The property has been operated for some time with good results. The ore is oxidyzed iron carrying gold, silver and lead and netting in the neighborhood of $50 per ton. The vein is said to be true fissure, cutting across all formations, and exposed for several feet.

UTAH.

SAVING THE GOLD. — *Tribune:* Since the Spaish mill in Bingham started up on its last run it has been operating quite successfully, and is said to be saving over fifty per cent of the silver in the ores in addition to the gold. The improvement is said to be due to the introduction of the method used at the Marion mill in Camp Floyd, which provides for an admixture of peroxide of sodium with the cyanide of potassium, the combination resulting in a saving of more of the gold as well as a considerable percentage of the silver.

BONDED THE BUTLER-BECK.—*Tribune*: W. W. Wallace of Sevier county has taken a bond and lease on the Butler-Beck mine and mill in the Gold Mountain district, and has already started up the mill. This property is located on the same vein as the famous Sevier mine, and is about two miles distant. The terms of the bond call for a price of $55,000, with a year's time in which to make the payment. Since the mill started up, ten days ago, it has been saving values to the extent of $12 per ton in gold on ore taken from the Tenaessee, one of the claims of the group.

COLORADO.

A NEW PLANT AT FLORENCE.—The Metallic Extraction Company will build another 150-ton cyanide plant at Florence. Superintendent Argall says he has plans prepared and is ready to receive bids for the construction of a new mill.

CRIPPLE CREEK GOLD OUTPUT.—The daily average shipment over the Midland is 325 tons of ore and over the Rio Grande 350 tons. This ore will average $50 a ton. The five mills, including the Cyanide, the Gillett and the Hartzell, have a daily capacity of 160 tons of low-grade ore. This will average $20 a ton, giving a total product from all sources of $1,000,000.

ARIZONA.

THE MAMMOTH RECONSTRUCTION SCHEME.—The following circular has been issued to the stockholders in the old Mammoth property, and is the basis upon which the contemplated reorganization of the company is to be made:

The present company to go into voluntary liquidation, and a new company (to be called the Mammoth-Collins Gold Mines, Limited,) to be formed to take over the property of the present company, together with the Collins mines, and to work the combined properties on a large scale, with a mill of 400 tons daily capacity, and with either a tramway from the mine to the mill, or a pump and pipe line from the river to the mine. The new company to have power to issue bonds to the same amount as the present company is authorized to issue the same. The present debenture holders to exchange their bonds for an equal amount of bonds in the new company to carry interest as from the 31st of December, 1895 and also to accept similar bonds in lieu of interest calculated to that date. The nominal capital of the company to be £100,000 in 2,000,000 shares of 1s. each. The present shareholders to receive one fully-paid share in the new company for each fully-paid share they now hold in the present company. The vendor of the Collins mines to procure subscriptions for 700,000 shares in the new company at par (realizing £35,000) for working capital. The purchase consideration for this company's property to be such an amount as may represent the sum of £20,000, and the nominal amount of the mortgage debentures issued by the company with accrued interest to the 31st December, 1895, and the said consideration shall be payable as to £20,000 in 400,000 fully-paid shares of 1s. each of the new company, and as to the balance in 10 per cent. First mortgage debentures, redeemable in 10 years from the 31st December, 1895, by means of a sinking fund commencing after the 31st December 1898. The purchase consideration for the Collins property to be £65,000, payable as to £45,000 in fully-paid shares of the new company taken at par, and as to the balance, £20,000 ($100,000,) in cash by means of a royalty of 50 cents (2s.) per ton on all ore from the property treated by the new company, the amount of such royalty to be ascertained and paid monthly until the balance (viz., $100,000—£20,000) of the full purchase money shall have been paid, the minimum royalty to be $2,500 per month and the balance remaining unpaid at the end of each month to bear interest at the rate of one-half per cent per month. The new company to discharge the liabilities of the old company, and pay the expenses of and incident to the carrying out of this scheme as provided by the agreements referred to in the notice of meeting.

IN THE GUNSIGHT COUNTRY.—The People's Milling, Mining and Investment Company of Yuma, Ariz., has recently taken fourteen claims in the Gunsight country, Pima county. The best developed of these claims is the Old Mine. The formation is granite and feldspar, carrying free milling gold. The vein is two feet wide. They will soon erect a mill and reduce the ore on the ground. This district is fourteen miles long and four miles wide, with ledges closely interwoven.

LOWER CALIFORNIA.

A NEW MANAGER. — A new manager has been appointed for the Progreso Mining Co., whose extensive properties are about fifty miles north of La Paz. The new official has power to thoroughly test the capacity of the mine, and if everything proves satisfactory will give permanent employment to 1,000 or 1,500 men.

MEXICO.

SOLD FOR HALF A MILLION. — *Oasis:* The Moctezuma Concentrating Co., organized under the laws of New Jersey, have sold their valuable mining claims at Nacosari, situated in the northeastern portion of the State of Sonora, to the Guggenheims of Monterey for the sum of $500,000 gold. The mining properties that have thus passed into the hands of the great smelting firm comprises twenty-three claims, six of which are of copper, the balance silver. They are situated in deep canyon about 120 miles from the railroad. A line will at once be constructed for a distance of twenty miles thereby saving the new owners $8 a ton for the transportation of the ores.

Sierra Buttes G. M. Co.'s Report.

On the 24th ult., the 51st semi-annual meeting of this company was held in London. F. Teadron presided. Of the Whitlock mine he said: The developments up to the present time at the Whitlock mine have been emiaently satisfactory. The working not only carried ore all the way down in the Whitlock shaft for a distance of 270 feet, but they also carried ore down in the new shaft some 400 feet, where for the whole distance from the adit level to abeut 50 feet below the 150-foot level, the ore was good. There the vein was broken by the same flat vein that has broken the main Whitlock shoot at the surface, or rather where the adit tunnel enters the lode in the Whitlock shaft. In this case, however, the breaking of the vein is not an injury to our property. On the contrary, to a certain extent, it is a great advantage, because the only effect it has had upon the vein has been to thrust it forward, and we have found the vein beyond the thrust is solid and good, and with as clear an indication of permanence as before the break, while as the break is crossed by another vein, whatever value there may be in that vein is so much to the good. In the 150-foot level below the adit level the vein may be taken—the paying part of the vein—at about 400 feet in length, and in the level driven out from the 250-foot level the vein has already been developed for nearly 200 feet, and they are still in ore. So that in the Whitlock we have the vein proved by two shafts going down, and it is only reasonable to suppose that since we have good ore in the two levels we have a large body of ore between these two levels. As the samples taken up to the present time average about $8 a ton, and as the crushing of the mill for the month is estimated at about $8 a ton, I think we have good reason to expect that in the Whitlock mine we have a property that will repay us, and repay us well, for the money it will cost us. Up to the present time—or, rather, to June 30—the expenditure on that mine amounted to £35,471, including the purchase money. It is to the Whitlock mine, so far as I can see, that we have mainly to look in the future. For up to the present time the developments in the other property we have bought—the Mammoth mine—are not satisfactory. That mine was bought very cheaply, for a very small sum of £5000, and up to the present time its development has cost us, including the purchase money, £10,379. We have developed it by continuing the level that we found when we were there, and by driving a deep tunnel to reach the lode, and then driving along the lode, and afterwards making a rise to the upper tunnel. If you read the directors' report, the impression made upon you, I should think, would be a very satisfactory one. The Mammoth mine was bought as a $5 proposition. The men who sold it did not claim that it would yield more than $5 a ton, but they calculated that it could be worked very cheaply. That was also the impression made upon our minds when we were there and also upon Mr. Johns. Assays were taken as fairly as possible of as much of the lode as was laid open by the men who had been working it, and in whose experience and veracity I still place entire confidence. The man who made the prospects told me he must have taken 1500 samples from the lode, day by day, opening out on it, and of these there were not twenty that did not show visible gold. Then we sent our most experienced mine captain to stay there some days, and take his own samples right through, as fairly as he possibly could. This he did with much more care than it was possible to exercise when I was present. He weighed the pulp and he weighed the gold, and put the average down at $6, and if you refer to the directors' report you will see that in many places it assayed $7. In the deep adit, when struck by the tunnel, the lode was of great width. It seemed to be wider below than in the upper tunnel—in some places 30 feet wide—and it appears that the gold is disseminated more or less through the whole of those thirty feet. If there were only a little more gold in the ore this would be a splendid property, but unless there is more gold in it than we have at present in that tunnel, it will be a great disappointment. Mr. Johns has always been a little fidgety about how this rock will come out in the stamps—how it will stand the test of stamping. He is afraid it may not turn out as well in the mill as when crushed by hand and then tested in the horn-spoon. In one of his visits, subsequent to the letters which appear in his report, he had the ore taken from four or five different places—about 200 lbs. in weight each—sent to San Francisco, to be crushed there in a mill and assayed. He seems to have been completely upset by the result of the assay. When he left the Mammoth, he wrote in good spirit; but the tone of his letters completely changed when these assays had been made. Now, I think the matter is of sufficient importance for me to read you an extract from his letter of September 21st, which we received on October 5th. He says: "You are well aware from the various reports sent to you that the ore has been developed from the main tunnel in the Mammoth mine so far is of too low a grade to be profitably milled." The main tunnel is the one where the lode is reached in depth. "The ore above the upper tunnel is hardly of sufficient quality to warrant the erection of a mill at the present time, and there is no certainty, of course, that the ore above the said upper tunnel will yield the estimated value placed upon it." By this he means that, although the ore in the tunnel may have averaged $6 all the way through, it does not follow that the same figure will be maintained to the surface. "I have," he continues, "lately had samples of 200 lbs. each taken from the upper tunnel, the raise from main tunnel, from the vein where cut through to the main tunnel, and from a cut into the vein from the south bottom drift. The results are not satisfactory, and my advice is not to erect the mill at present, but to complete the ditch, put in a compressor, so as to work power-drills, and a pump, should it be necessary, and sink the shaft 200 or 300 feet deeper, and test the vein at this greater depth. The property is certainly a very promising one. The vein is large, and there is gold all through it; and recent developments on the mother vein have discovered very rich mines where the surface and upper workings did not have the favorable indications we have. The general opinion of those who have visited the Mammoth is that we shall certainly develop a big mine by continuing the works downward." We have instructed Mr. Johns to sink the shaft, to put up a compressor and a five-stamp mill, and until that mill has been working for some time I refuse to change the opinion that I held and still hold—that the Mammoth will prove a very valuable property.

I have come to this conclusion, that mining in California, if you can only buy a mine at a proper price, and can get a vein of good appearance and prospects, is about the most profitable form of industry that one can go in for; but it certainly does not yield a fortune. We cannot complain of Uncle Sam. The last six months it produced 10,823 tons of ore, yielding on an average 28s. per ton, and costing 18s. 6d. Since we bought it the mine has produced 101,494 tons, of a money value of £193,253, and has actually given us up to the present time a profit of £79,000, of which we used £12,000 in the development of the property, have given you £56,866 in dividends, and have put £10,000 by. So that in six years it has yielded twice the money that it cost. With regard to the Buttes, is has lived on from month to month, and now it is living on from week to week, and the Eureka is a little better, for it is going to live on through the winter. This is the last news we have of the Eureka. Now, let us see what our position is. When the Buttes pays to the Eureka the small balance that it owes on the purchase of the new mines it will have a reserve left up to June 30 of the present value of £4000; and to pay you the dividend that we are paying you to-day we had to draw upon the old balance to the extent of £476, and if I thought we were going to keep on drawing upon the old balance I should have to ask you to be satisfied with half the dividend you are receiving, because the Buttes must put money by. But as we have every reason to believe the Whitlock will be a good earning property, and that the Whitlock and the Uncle Sam will more than earn the dividend of the Buttes, we not only pay you this dividend, but fully expect to pay you the same dividend in six months' time. With regard to the Eureka, after paying this dividend, it will have cash, including what is owing by the Buttes, and investments of the present value of £38,283; and, therefore, as the Eureka has so large a reserve, we have not hesitated to pay you the same dividend as you have had now for a long period, although to do so we have had to draw upon the reserve to the extent of £1669. As you were willing to have money put by out of your profits when things looked well, we shall not hesitate to use a portion of that money thus put by to maintain equal dividends when things are not looking so well, unless we see perfectly clearly that the bad state of affairs is going to continue, of which you will have warning in ample time. The chairman concluded by moving the adoption of the report and accounts. He then moved that a dividend of 6d per share, free of income tax, be and is hereby declared on the Sierra Buttes mine shares, payable on the 25th inst. and that a dividend of 9d per share, free of income tax, be and is hereby declared on the Plumas Eureka mine shares, payable on the 25th inst. Both motions were adopted.

Coast Industrial Notes.

—Los Angeles oil sells for fifty cents per barrel.

—The total British Columbia seal catch this year was 71,359 skins; last year, 94,701.

—Local corporations paid dividends amounting to $604,706 in October, nearly $50,000 more than in October '94.

—Secretary of the Navy Herbert has decided that two of the six Government twin-screw gunboats shall be built by the Union Iron Works of this city. They will cost $209,000 each.

—California has received eight awards on brandies at the Exposition of the Societie Philomathique held at Bordeaux, from the first of May until the first of November of this year.

—The Los Angeles company which has on hand the enterprise of the establishment of a smelter in which petroleum will be used for fuel, has received its incorporation papers from Sacramento.

—California has been awarded the gold medal for the best State display at the Atlanta Exposition. A number of other States were awarded silver medals, but California alone received the honor of a gold medal.

—The National Coal Mining Company has incorporated at Portland, Or., to do a general mining business, etc.; capital stock, $220,000. Iucorporators—J. B. Parker, F. M. Batchelor, G. Balsamy and R. A. Reid.

—There are in operation in this city 265 miles of street railway track—106 miles cable railway, 104 electric road, 35 horse tramway and 20 steam. The number of cars in daily use is 696 and the number of employes is 2772.

—The Southern Pacific has announced to the merchants of Salt Lake its inability to arrange for putting into Salt Lake the rates in force from San Francisco to Ogden, as its negotiations with lines from Ogden to Salt Lake are barren of satisfactory results.

—Coal receipts at San Francisco by water, exclusive of product of Mt. Diablo mines, for the first ten months of the year were as follows: Puget Sound 342,374 tons, Oregon 37,955, Eastern 17,087, Alaska 1,050, Australia 174,890, British Columbia 441,484, English 110,440, Welsh 5,892, Japan 5,697; total, 1,136,869 tons.

—The Gerlach Wave Motor Co., at Capitola, are having built a wave motor with 720 square feet of paddle surface, which they calculate will give 400 H. P. They are spending nearly $20,000, and say the motor will develop power commensurate in cost to that produced by coal were that commodity procurable at 25 cents per ton.

—The stockholders of the Nevada County Narrow-Gauge Railroad Company will meet December 31st, to decide upon a proposition to issue bonds to the amount of $250,000, to be used in retiring that much bonded indebtedness. The first mortgage bonds now outstanding are for $1000 each, and will have run twenty years on the date of the meeting. They bear interest at the rate of 8 per cent per annum.

—The *Lower Californian*, speaking of the guano beds at the island of San Martin, off the coast of that region, says: "These guano deposits are not as good as those on the Peruvian coast, owing to the fact that they are occasionally damaged by rain, and until quite recently were thought to be of little value, though now it is found to be worth from $12 to $15 a ton as fertilizer in the California market. The deposits, by concession from the Mexican government, belong to the Mexican Land and Colonization Company."

—In the case of Jno. Hammond vs. the Stockton Combined Harvester and Agricultural Works, the U. S. Circuit Court of Appeals has decided that there was no infringement; that Hammond's patent for a railway car body was only "an exercise of the imitative faculty, and did not rise to the dignity of invention." The Court has, apparently, not coincident views with Mr. Smyth in his recent article, "Is the Inventive Faculty a Myth?"—which article, by the way, has attracted universal attention.

—The London *Times* of Oct. 28 has a three-column article on the Nicaraguan canal from a correspondent recently there, who says it is clear the project cannot be carried through as a private undertaking, but that it must be under the auspices of some strong Government, which without doubt must be the United States. He thinks the cost will be nearer $150,000,000 than $100,000,000. The true course of labor, he thinks, will undoubtedly be the West Indies negro labor, being far superior to the Chinese.

—A discovery of anthracite coal is reported from Iron county, Utah, which, if true, will become an important factor in the future development of that region. Deposits of iron ore are found in that locality, and beds of bituminous coal, but anthracite was not known to exist there. There has been some talk of establishing furnaces and steel works, and it is known that the Rio Grande Western has in contemplation an extension of its Salina branch to the iron fields. Several railroad surveys from Salt Lake to Los Angeles pass through that coal and iron belt.

—A new line of railway to connect the Atlantic and Pacific coasts of Nicarauga will soon be projected in that country. The work will be placed in the hands of an engineer of international prominence, and the funds to complete it will be furnished by the Nicaraguan government. The only line of railway in the republic at present extends from the port of Corinto, which came into prominence last spring through its temporary occupation by the British forces under Admiral Stevenson, to the capital, Managua, thence to Grenada, in the interior. The proposed new road will connect with the present line at a point near Corinto, and will run in a southeasterly direction to the city of Rame, which lies at the headwaters of the Bluefields river, about sixty miles from Bluefields, on the Atlantic coast. As the Bluefields river is navigable for steamers drawing an average depth of water, the new railway will permit shipments of coffee and other products direct to Rame, at a great saving of time and expense as compared with the present arrangement. The road will also result in developing the rich coffee fields of the interior, and thus greatly enhance the profits connected with that industry. At the present price of coffee, it is estimated that a plantation costing $25,000 will pay for itself in five years, and it is to this branch of agriculture that much of the capital of Nicaragua is being applied.

Commercial Paragraphs.

M. A. GRAHAM is putting up a 30 H. P. marine gasoline engine for an 80-ft. bay schooner.

THE Union Gas Engine Co. has sent a 25 H. P. engine to the Confidence mine, at Daggett, San Bernardino Co.

THE Siemens and Halske Electric Company, successor to the Grant Locomotive Works, has an order for 55 ten-wheel engines for the Burlington & Quincy road.

THE firm of John A. Roeblings' Sons Co. is supplying 217,000 pounds of wire for the Big Cottonwood, Utah, transmission plant—over 200 miles of different sized wire.

THE Vulcan Iron Works, in addition to wire ropeways, mining and sawmill machinery, manufactures ice plants, one of which was shipped this week to Honolulu.

THE Trustees of Reclamation District No. 349, on Sutter Island, have given to the Krogh Manufacturing Company a contract to put in a mammoth pumping plant on the island. The contract price is $10,870.

BEMENT, MILES & CO., of Philadelphia, report among their recent shipments a lathe to this city with a 10½-foot swing and four independent carriages, which turns 50 feet long and weighs 350,000 pounds. Another shipment was to Buda Pesth.

WM. HOLLAND, brass founder and finisher, 60 S. Canal St., Chicago, says he has recently perfected a process for casting copper which is hard and entirely free from blowholes. He has a mixture which is especially adapted for making armature commutator segments.

THE Fulton Engineering and Shipbuilding Works are supplying the Alaska-Willoughby Company with a 10-stamp mill to be run by water power, three Pelton wheels, and a 6-ft. wheel in the mill to run the battery, a 3-ft. wheel for the rock breaker, and a 2-ft. wheel for the 3 Frue concentrators.

JOHANNESBURG, SOUTH AFRICA, is to have an industrial exhibition next May and June. The area of the exhibition grounds will be 500,000 square feet; the buildings themselves will cover 100,000 feet. Intending exhibitors are invited to communicate with Charles P. de Garmo, Johannesburg, S. A. R.

THE management of the Hicks quartz mill, Ashland, Or., are adding to their present plant a new 5-stamp combination mill from the Joshua Heudy Co. of San Francisco, consisting of the stamp mill proper, a concentrator, two pans, each of 5 feet dimension, and an 8-foot settler. The new mill will work more refractory ores and insures a more perfect saving of the gold. The total daily capacity is 18 tons.

THE Gates Iron Works last week shipped fifteen carloads of machinery to South Africa. The shipment includes three large Corliss engines, one of which is for hoisting, one for pumping and the third for milling purposes, also several rock and ore crushers. The Gates people are also just completing the erection and installation of the largest chlorination plant in the world for the Kildavan Mining Co. at Deadwood, South Dakota. The plant will handle 100 tons of gold ore per day.

REGARDING speed of mine hoists, W. M. Ruth, of the Edward P. Allis Co. of Milwaukee, Wis., says: "At the Tamarack mine, in the Lake Superior copper region, thirty-nine cars per hour were recently raised from a depth of 3186 feet for six consecutive hours. This is equivalent to an average hoisting speed of 3180 feet per minute, or 36.1 miles an hour, allowing a trifle over one minute for loading and unloading the cages. The load of rock is 6720 pounds. This work was performed with a direct-acting or first motion hoisting engine made by the Edward P. Allis Company. The steam cylinders are 42x84 inches and the hoisting drum 30 feet in diameter. It has been in service several years. At another shaft owned by the Tamarack Mining Company a trip was made some days ago from a depth of 4500 feet in one and one-quarter minutes, equivalent to a speed of 3600 feet per minute, or nearly 41 miles an hour. At this shaft the engine, which was also built by the Edward P. Allis Company, is 32x84 inches and the hoisting drum, a double cone, 13½ feet and 36 feet diameter; each cone will carry 6000 feet of rope. For short periods, speeds as high as 4200 feet per minute have been observed."

FOR SALE!

120 Acres in San Diego County,

With one ledge 4 feet quartz and two cross ledges 2 feet: extensions of well known mines. Inquire 1523 Stockton St., San Francisco.

Personal.

J. J. CRAWFORD has returned from El Dorado county.

CAPT. W. L. MERRY has bought the Carley mine, Calaveras Co.

F. C. MATHYAS, field assistant to the State Mineralogist, is in Lake Co.

HENRY SHADE will be the new superintendent of the Virginia, Nev., gas works.

A. S. HALLIDIE has returned from Boston and New York via British Columbia.

CLAY GARRARD has assumed charge of the Plymouth Rock mine, near Jenny Lind.

ED BOYCE of the Cœur d'Alenes has gone to Alaska to try to organize a miners' union.

J. H. MEANS of the State Mining Bureau is collecting data and statistics in Marysville.

JOSEPH WEISSBEIN, general manager of the W. Y. O. D. mine, has returned to Grass Valley.

A. G. BRIGGS has assumed the superintendency of the Whitlock property, Mariposa county.

A. THURSTON HEYDON has resigned the foremanship of the Lady Emma mine, at Kelsey, Cal.

W. B. NICHOLS is present superintendent of the Merrill G. M. Co.'s property, at Basin, Montana.

G. WHARTON JAMES of Mt. Lowe is lecturing in Arizona on "The Grand Canyon of the Colorado."

V. P. YELMINI of Amador is examining mining property at Glencoe and West Point, Calaveras Co.

M. A. GRAHAM, of the Oriental Gas Engine Co., has returned from a visit to his mine in Shasta county.

CAPT. MESSENGER has been appointed postmaster at the new office at the Gwin mine, Calaveras county.

HENRY PIPER of Butte is now master mechanic of the Tiger and Poorman properties in the Cœur d'Alenes.

RUSSELL SCHOOLEY of Dayton, Nev., goes to South Africa this week as engineer in a Johannesburg mine.

CHAS. KAHL, former foreman of the Providence, is now superintendent of the Cadmus mine at Nevada City.

GEO. B. DENNIS, of Spokane, Wash., has been elected president of the Northwestern Miners' Association.

A. H. RICKETTS has been appointed attorney for the Mineral Land Committee of the California Miners' Association.

S. W. DORSEY, the chief promoter of the Colorado Southern Railroad, is in this city studying some mining propositions.

W. GARRARD of Angels has taken charge of the Santa Rosa. This is the property recently secured by Messrs. Lane & Hayward.

R. H. CAMPBELL of Siskiyou county is at Ashcroft, B. C., with a view of putting in a hydraulic elevator plant at the Horsefly.

A. N. BUTTS, formerly of Los Angeles, will superintend operations on the Bolitho mine, near Angels, Calaveras Co., this winter.

C. C. MAY, Davenport, Wash., has taken charge of the Triune mine and mill at Golden and will push both to their fullest capacity.

H. M. GREGGS takes the place of W. J. Townley as superintendent of the Sanger mine, Baker City, Or., and is about to resume work thereon.

WALDEMAR LINDGREN, whose excellent geological work has received much recent notice, is about to make an examination of the Pine Nut district, Nevada.

E. S. DE GOLYER has returned from Salt Lake to San Andreas, for the winter, where he will superintend operations on the Gottschalk and Donnellan mines.

DR. BOYSON has succeeded in interesting French capital in the Pioneer mine, Plymoutb district, Amador county, and Superintendent Robinson has resumed work.

JOSEPH L. GIROUX, superintendent of the mines and smelting works of the United Verde Copper Co. at Jerome, Ariz., is at Gila Bend examining the Volcanic gold property.

GEO. GARSIDE of Juneau has been appointed superintendent of the Alaska-Willougbby Company, which will operate the Willoughby property at Funter bay, Admiralty island, Alaska.

J. L. LYON of Oakland is superintendent of the Monarch mine, at Rough and Ready. Hoisting works will be built, the shaft retimbered, and by New Years sinking on the ledge will begin.

PHILIP DEIDESHEIMER is reported acquiring considerable mining property in Calaveras and Tuolumne counties. A local paper announces his recent purchase of the Spring Gulch mine, near San Andreas, for $60,000.

E. H. MOVIUS, Secretary Montana Mineral Land Commission, writes that the October work of the Commission was important and effectual. Twelve full sections and fifty fractional sections were examined during the month.

PRESIDENT JEFFREY of the Denver and Rio Grande Road, was formerly a mechanic and railroad engineer. He says that he has come to "the conclusion that the wage question is not so important as honest, capable, faithful and reliable service. A careless engineer can lose for his company thousands of dollars yearly on his engine, and it has taken the most careful, painstaking scrutiny to discover the loss."

ANNUAL MEETING.—THE REGULAR ANNUAL MEETING of the Stockholders of the Occidental Consolidated Mining Company will be held at the office of the company, room 69, Nevada Block, 309 Montgomery street, San Francisco, California, on MONDAY, the 18th day of November, 1895, at the hour of one o'clock, P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, November 15, 1895, at 3 o'clock P. M.
ALFRED K. DURBROW, Secretary.

Hydraulic Mine for Sale.

Not on a navigable stream; in northern California. Good dump; no trouble with tailings; 180 acres of mining ground; 5000 inches of water. Can work eight months in the year. Ample opportunity given a buyer to fully test the property before payment is made. For further details,

Address X, 2022 W St., Sacramento, Cal.

PRICE, BOUND IN CLOTH, $5.00

F. A. HUNTINGTON'S NEW IMPROVED
Centrifugal Roller Quartz Mill.

This Improved Mill has the following advantages over my Geared Mills, viz:
1st.—I dispense with the wooden frame with posts and set the mill on heavy timbers or a concrete foundation, thereby securing a solidity that cannot be attained when set on posts.
2d.—I dispense with gearing and drive direct from the pulley.
3d.—There are five less places to oil.
4th.—The Mill is built much heavier and stronger than the former ones.
5th.—Being heavier and set on a solid foundation, it can be run much faster, thereby increasing its crushing capacity in the same proportion as centrifugal force is increased by increased velocity.
Manufactured by F. A. HUNTINGTON,
143 First Street, San Francisco, Cal.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.

The Improved, Iron-Frame, Self-Contained, Coshion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered bono inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

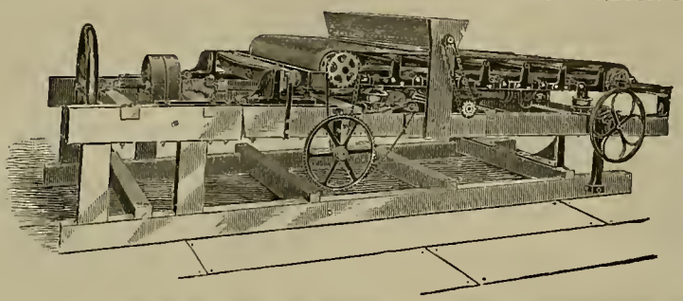
The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

NINETY-FOUR AND ONE-HALF PER CENT —SAVED— OF ORES DIFFICULT TO CONCENTRATE.



A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Motion.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated. WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE ..... $350 EACH

Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1895.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a True, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully

E. L. BALLOU, Propr. Ballou Reduction Works

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For Saving Gold

IN QUARTZ, GRAVEL OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER.

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates replated, bought, or gold separated. THOUSANDS OF ORDERS FILLED.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 7. 1895.

Steel and iron are still depressed; silver is steady, with a rising tendency—$8,000,000 were transferred on the 1st to Japan by the Bank of England, as the first payment of the Chinese indemnity. It is thought prohahle that £3,000,000 will he used immediately to pay dehts incurred for ships and war material. It is expected that the halance will he wanted soon in payment for more ships and munitions already ordered. It is not considered likely that any gold will he taken out of the hanks, but it is possihle that some of the gold will he used to purchase silver, which expectation tends to keep up the price of silver.

D. Houston & Co. of New York, in their "copper circular" of the 1st inst., say:

The steady tone of the market noted at the heginning of last month has given way to an easier feeling and lower prices. Consumers having bought freely some time previously, demand during Octoher was quiet and in sympathy with general financial conditions; holders are more ready to meet inquiries at figures ¾ to ½ helow opening prices in October. Lake copper can he bought now at 11¾@11⅞ cents per pound. The larger manufacturers are pretty well supplied with copper on contracts for the halance of the year, and are therefore inclined to defer anticipating future necessities heyond what they have already arranged for. The decline in the market has not been attended with any active buying movement on the part of consumers, while, on the other hand, producers display no anxjety to force sales. The market may be characterized as a waiting one.

The wild foreign speculation in South African gold mining securities, and to some extent the political situation in Europe, and the approaching meeting of Congress here, may he regarded as responsihle in a measure for the present state of the copper market. The enormous aggregation of capital involved, and the gigantic character of the speculation in "Kaffirs," have awakened apprehension in many quarters, and that suhtle phase of the mind called "sentiment" has hecome hypersensitive over what may prove, after all, a danger more hypothetical than real. However that may he, the foregoing are factors of great importance in the financial and husiness world at present.

Actual consumption of copper in this country continues very large, and according to good authority in some departments of manufacture was even greater the past month than during tbe month previous. English consumption also shows an increase for the three months ending September 30 of more than 18 per cent compared with the second quarter of this year. The better grades of copper in Europe are pretty well ahsorhed, until the entire stock of American copper in England hy the middle of Octoher had dwindled down to 1606 tons. Exports of copper from this country have lately fallen helow the allowance under the old agreement, and the arrivals of American copper in England during the first nine months of 1895 were 9594 tons less than during the same period in 1894. The London copper market has fluctuated hetween £47 5s spot, and £47 12s 6d futures on October 4, and £44 17s 6d spot, and £45 5s futures on October 29, with large sales.

Copper production, in tons of 2240 pounds, as follows:

September—	*1895.*	*1894.*	*Increase.*	*Decrease.*
United States....	15,361	12,757	2,594	.....
European.....	6,947	7,110	.....	163
U. S. Exports	4,106	7,093	.....	2,987
First 9 Months—				
United States....	124,077	122,042	2,035	.....
European.....	63,548	66,730	.....	3,182
U. S. Exports	48,849	60,496	.....	11,647

After the advance in copper the large companies, such as the Calumet and Hecla and Anaconda, increased their output materially. It would undouhtedly he to the interests of the market in preserving its stahility if these leading producers would to some extent curtail their production.

Exports of copper during Octoher were 3801 tons, and arrivals from Europe 450 tons fine copper.

European copper statistics per cahle to-day show a decrease in stocks of 1630 tons aud in visihle supply of 2380 tons.

The London market for copper, closing quotations for G. M. B.'s this date is £45 2s 6d spot and £45 10s futures.

The market for copper in New York quotes 11¾@11⅞c for Lake, 11⅜@11½c for electrolytic and 11@11¼ for casting hrands.

Mining Share Market.

SAN FRANCISCO, Novemher 7, 1895.

Immediately following last week's issue, the share market hegan to weaken, resulting in low prices Monday morning. Although the decline was only about ten per cent, yet combined with a sick, inactive tone, it caused a panicky feeling with dealers who operated on the complexion of the market. Many hrokers caught the panic fever and threw out to customers the stocks that were not well protected hy margin. Who hought the shares and who have been steady huyers for months past is a question that is heing discussed in more quarters than one. It is impossihle to disguise the fact that there has been and is still a steady concentration of shares. It cannot he correctly affirmed that outside pools have been successful in this line, for the temptation to make turns has been too pronounced to resist. It would seem as if there has been a quiet absorption hy a comhination or else hy a large moneyed man, prohahly for the purpose of promoting a deal on the favorable conditions of several of the mines, with all indications pointing in the direction of two or more ore strikes of some importance. Never within the history of the Comstock have so few shares heen held hy the outside public. Disgust and a decided feeling that there is no prospect in the near future are too marked with outsiders to even helieve they are interesting themselves in the game. Then who is?

For several years past work from one end of the lode to the other has been made with the purpose of getting all the mines in condition for active and energetic developing. Of necessity, so as to get outsiders to pay assessments on as many shares as possihle, there have heen false moves on the upgrade, hut these very moves have contrihuted no little in causing the puhlic to sell, not at the advances, but around the low prices. How long this kind of manipulation will continue it is hard to say, hut, judging the future hy the past, it should not he long hefore a hull movement sets in; it may even now be moving in this direction, notwithstanding inside cappers are croaking and putting out reports of slightly lower prices hefore the deal sets in. If there is anything good in the future, and everythiug points in that direction, present prices justify huying, even if the general market does go down from ten to twenty-five per cent. A person that waits for the lowest prices hefore huying gets left the same as does the one who waits for the highest prices before selling. There are factors at work in the East which caunot he ignored, and which will force a deal of some magnitude hefore twelve months, fight against them as insiders may. Aside from this the suits are in a fair way to he out of the way soon, hesides which the suit against proxy voting will cause mine managers to be rather chary in securing control hy such dishonest and unscrupulous methods. Brokers should unite against giving proxies. What have they gained hy such a course? They have not heen ahle to pay current expenses. Manipulators have reason to helieve, judging from the past, that hrokers, after heing kicked and cuffed, will lick the hands of those supposed to he in control whenever given a crumh. This ought, in the interest of all concerned, to be changed hy brokers proving themselves men, and not cringing animals, currying favors from those who use them so hadly.

From the Comstock mines the news was never before of so favorahle a character. From one end of the Comstock to the other more work has been and is still being done than ever hefore known. In several of the mines ore has heen struck, which, when developed, will result in dividends; but how long the managers will continue to have work done so as to hring ahout assessments, it is hard to say. They cannot do it forever, and when forced to show up ore a much hetter state of affairs can he looked for. In the Alta group the work is unquestionably in the direction of ore developments, and ore, too, that will pay well. In the Gold Hill mines, from Caledonia to Ophir, the work promises surprises to those who have no confidence in the mines. In at least three, strikes have been made which are heing developed in such a way as to lead to the extraction of $40 to $80 ore, and even higher, before the end of 1896. This is all to the west. The ore is gold-bearing. In the middle group there is every promise that two or three of the mines will also surprise the skeptics, yet it may be several weeks first. In the north-end group the work under way is all that can he asked. It points to strikes before next spring passes, and strikes, too, of some importance. In this issue it is not necessary to particularize, hut dealers can rest assured of something important heing uncovered. They uust not run away with the idea that the share market will go up right along, for there must and will he heavy breaks and strong depressions—it is these that make the gamble and hring in outside moneyed traders. Always he prepared for the unexpected.

From the Bodies private news is more favorable, but official letters are of the same character as they have been for some time past.

The following is the usual monthly statement of moneys on hand:

Assessment Notices.

IOWA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the 23d day of October, 1895, an assessment (No. 21) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 2, No. 419 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of November, 1895, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 16th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. THOMAS, Secretary.

Office—Room 2, 419 California street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of November, 1895, an assessment (No. 77) of Fifteen (15) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of December, 1895, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors held on the fourth (4th) day of November, 1895, an assessment (No. 59) of twenty-five cents (25 cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the ninth (9th) day of December, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California.

BULLION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of November, 1895, an assessment (No. 46) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 20, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1895, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 20, No. 331 Pine street, San Francisco, California.

SUPERIOR MILL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placerville, El Dorado county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the fifth day of November, 1895, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 916 Market street, Room 81, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of December, 1895, will be delinquent and advertised for sale at public auction, and on ess payment is made before, will be sold on WEDNESDAY, the 30th day of December, 1895, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. HOWARD BARNARD, Secretary.

Office—Room 81, 916 Market street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the second day of November, 1895, an assessment (No. 1) of 10 cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at office of the company, 237 Twelfth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the second day of December, 1895, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the fifth day of January, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

"Ratio of Gold and Silver."

TO THE EDITOR:—In this week's issue you say the ratio of gold to silver is 32.56. I don't believe it. Where do you get your figures?
Virginia, Nev., Nov. 5, '95. READER.

[The only item in the issue of Nov. 2d on that subject is one in "Concentrates," which is reprinted in full: "According to the annual report of the director of the Mint, the ratio of gold to silver during the year was 32.56." This is probably the statement from which our Virginia, Nevada, reader so promptly and forcibly dissents. He will observe that the figures are not ours and the statement was credited to and based upon the official report of the director of the U. S. Mint for the calendar year 1894.

However, since the matter is questioned, and as the subject is one of general interest, a few figures are in order. The figures are obtained from U. S. reports. Their accuracy has not been disputed, and their bearing on the subject is a cold matter of fact not susceptible of argument. Their acceptance or rejection in no way affects the case.

According to the official figures, the ratio value between gold and silver is determined by comparison between their bullion value.

At the date of this writing (Nov. 7th) the silver in a standard dollar is worth as bullion about 52.65 cents, making the ratio value between gold and silver about 30.47 to 1. The average fluctuations for the last ten years are shown in the following table:

Year.	Price.	Ratio.
1885	$1.0045	19.41 to 1
1886	.9946	20.78 to 1
1887	.9782	21.13 to 1
1888	.9399	21.99 to 1
1889	.9358	22.10 to 1
1890	1.0463	19.76 to 1
1891	.9878	20.92 to 1
1892	.871	23.72 to 1
1893	.7803	26.49 to 1
1894	.6348	32.56 to 1

It is to be borne in mind that the present relative value of fine gold bullion per ounce—$20.67—and the present relative value of fine silver bullion per ounce—67.5 cents—is the basis of these calculations, which is a simple divisiou of the price of an ounce of gold by the price of an ounce of silver, and has nothing to do with the "purity" of the metals nor the demonetization of silver, nor the depreciation of that metal, nor the ratio of 16 to 1, nor free coinage of silver, nor any of the political, financial or any other of the public questions connected therewith so widely discussed. The one is a subject of argument, opinion, legislation and agreement: the other is an existing fact as little susceptible of argument as the date of this paper or the chemical composition of water.]

A Few of Many Unsolicited Friendly Notices.

Extends Congratulations.

One of the very few journals of the country which received an award at the World's Columbian Exposition was the MINING AND SCIENTIFIC PRESS. The diploma was for the character of its editorials and the accuracy and reliability of its mining news. We extend congratulations.—*The Investor, Los Angeles, Cal.*

Thorough Reliability.

The MINING AND SCIENTIFIC PRESS of October 12th contains on its front page two excellent illustrations of the new hoisting works of the Louisa mine at Coulterville. It is doing a great work for Mariposa county through the amount of space it devotes weekly to an accurate resume of mining matters in this section. Its thorough reliability, coupled with its large circulation among the leading mining men and investing public, make it at once the best friend this undeveloped region has. The people of Coulterville, in particular, should subscribe liberally for it.—*Mariposa Miner, Coulterville, Cal.*

Best in the World.

The MINING AND SCIENTIFIC PRESS of October 19th contains a complete official report of the late Miners' Convention. The PRESS has been greatly improved, and has become the best mining and scientific publication in the world. It is cheap at its price, $3 a year.—*Gazette, Georgetown, Cal.*

A Mass of Mining Intelligence.

If there is a miner in California, Nevada or Arizona who does not take the MINING AND SCIENTIFIC PRESS of San Francisco, he should do so at once. It is one mass of mining intelligence, and very reliable.—*Eye, Needles, Cal.*

WANTED.—POSITION IN A QUARTZ Mill by a young man, as engineer or battery man, can run concentrators and dynamos, and give references. F. W. L., Box A., this office.

WANTED.—POSITION AS ASSAYER OR Amalgamator. Capable to take charge of mine and mill. Over 25 years experience. C. S. A., 1212 So. O Street, Tacoma, Wash.

WANTED.—POSITION AS ASSAYER, Amalgamator or Millman. Capable to take charge of mine and mill. Over 25 years' experience. Address ASSAYER, P. O. Box 812, Tacoma, Wash.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCTOBER 29, 1895.

548,797.—EXTRACTING PERFUMES—Beckett & Spencer, S. F.
548,801.—GUN SIGHT—F. W. Dobbel, S. F.
548,779.—HYDRANT—G. A. Doyle, Perris, Cal.
548,752.—ELEVATOR—J. W. Geurry, Oakland, Cal.
548,754.—DENTAL BITE CUP—A. P. Hays, Los Angeles, Cal.
548,815.—CAR FENDER—J. O'Donnell, S. F.
548,817.—DENTAL MIRROR—F. L. Platt, S. F.
548,662.—CLOTHESPIN MACHINE—P. J. Sharbach, Woodburn, Or.
548,821.—BUTTER CUTTING MACHINE—R. A. Simpson, Ferndale, Cal.
548,792.—AMALGAMATOR.—R. Wing, Butte, Mont.
549,043.—FRUIT BOX—G. D. Worswick, San Jose, Cal.
24,792.—DESIGN FOR RULER—N. L. Rigby, Los Angeles, Cal.
24,809.—DESIGN FOR BANK NOTE PAPER—F. X. Simon, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PORTABLE ELECTRIC DRILL.—J. W. Jaimison, of Vallejo, Cal., and J. M. Edwards, of Napa, Cal. No. 547,215. Dated Oct. 1, 1895. This invention relates to a drill, the object of which is to support a driving mechanism, so that the drill may be adjusted to operate in any desired position within the radius of its operation from the support, and in conjunction therewith to employ an electric motor through which power may be applied to actuate the drill in whatever position it may be turned. It consists of a standard, and extended base slotted longitudinally for adjusting the standard along the plate, a mechanism by which the staudard is adjustably secured, clamping jaws and a sleeve which is adjustably secured therein, a yoke fixed to one end of the sleeve carrying a drill shaft and feed mechanism, a driving shaft extending through the sleeve with bevel gears, by which power from the shaft is transmitted to the drill shaft, an electric motor supported by extensions of the field magnets, said extensions having flanges formed upon them and clamps insulated from the flanges and secured thereto, whereby the motor may be clamped to the sleeve so as to change position with it, and a pinion fixed upon the motor shaft, which engages a gear-wheel fixed upon the main driving shaft, so that motion may be transmitted to drive the drill in whatever position it may be placed.

STREET CAR BRAKE.—Henry T. Atkinson, Oakland, Cal., assignor of one-half to J. E. Morris of same place. No. 548,025. Dated Oct. 15, 1895. This invention relates to improvements in street car brakes. It consists, essentially, of a standard fixed upon the car, having a cam fulcrumed thereon, a chain connecting the car with a brake rod, links fulcrumed upon or near the fulcrum pin of the cam, a brake lever extending downwardly between said links and fulcrumed to their upper ends, a link or bar connecting the lower end of the brake lever with the cam above its fulcrum pin, whereby the movement of the lever forward about its fulcrum pin causes the cam to approach the lever, and a stop or stops against which the lever carrying links are arrested when forced forward together, and a latch or pawl adapted to engage the cam and retain it in contact with the lever, so that a variable power may be employed when applying the brake, and the brake may be instantly released by reversing the movement of the lever.

SOAP BUBBLE FOUNTAIN.—Samuel H. Tracy, New York, N. Y. No. 548,477. Dated Oct. 22, 1895. The object of this invention is to provide an automatically regulated apparatus for the continuous production of soap bubbles, with means for keeping up the supply of material as fast as exhausted, means for regulating the position of the nozzle with reference to the quantity of liquid in the bowl of the fountain, and also to regulate the size of the bubbles produced, and means for illuminating the same. It consists of a receiver in which the bubbles are formed, having a self-adjusting floating air supply nozzle, a means for supplying the receiver with a solution consisting of a main and supplemental reservoir and pipes or passages connecting them with each other and with the receiver, an electrically actuated valve, a float carried upon the surface of the bubble-blowing solution and connected through the intermediate mechanism to operate the valve so that the flow from the main reservoir is controlled, and in conjunction with these devices of a hood surrounding the air pipe, over which the bubbles flow into a catch basin below, the hood having transparent openings in its surface for the passage of light and a rotary disk with colored glasses fixed around its circumference so that lights fixed below will throw varying colored lights upward through the mass of bubbles which flow down from the receiver to the hood.

CLOSET SEAT AND COVER.—Frank G. High, San Francisco, Cal. No. 548,367. Dated Oct. 22, 1895. This invention consists of a closet having two seats with openings of different diameters, and a cover; both of said seats and also the cover being hinged to turn about a single fulcrum common to them all, said cover having a groove or channel to receive one of the seats, so that the latter may be closed into it and lie flush with its lower side. The intermediate seat has extensions rearwardly to connect with the hinge joint and may be provided with a removable filling of antiseptic or other material projecting slightly above the rims or edges of the channel and extending over the metal of which the rim is made.

VOTING MACHINE.—Thomas D. Stroup, San Francisco, Cal., assignor of one-half to George Sanderson of same place. No. 548,403. Dated Oct. 22, 1895. The principal object of this invention is to provide a simple and effective locking device by which the number of keys operated can be accurately fixed so that the voter is permitted to operate that number of keys and no more. The machine consists, in connection with the keys and the registering device operated thereby, of a peculiar locking bar actuated by the keys and adapted to permit the operation of one or more of the keys, as the case may require. There are also means for actuating the locking bar to cause it to perform its function upon the operation of a stated number of keys, and means by which this stated number may be varied according to the necessities of the case. The machine has also a means, controlled by the closing of the door of the booth as a voter departs, of setting back the registering mechanism to its initial position, ready for a fresh operation.

GANG PLOW.—Owen T. Owens, Livermore, Cal., assignor to the Benicia Agricultural Works of San Francisco, Cal. No. 548,386. Dated Oct. 22, 1895. This invention relates to that class of gang plows in which the wheel, which travels in the furrow previously made, is adapted to be used at various angles to suit the inclination of the ground, and in which also the plow bottoms are adapted to be raised off the ground for transportation, and the tongue to be turned about a pivotal center to allow the horse and plow to follow the curves in the furrows. To this end the plow consists of means for connecting and adjusting the inclined wheel, means for lifting the plow bottoms, and means for swinging the tongue. These means are all of a novel character and relate to matters of detailed construction which can best be understood by reference to the patent itself.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Niedecker & Alderson, in the Bobby Burns Mine, near Placerville, El Dorado Co., to impound tailings in a ravine below the mine; from Martin Bros. in the Martin Mine, near Placerville, El Dorado Co., to impound tailings in a ravine below the mine; from Eugene Piaggi, in the Blacklock Mine, near Placerville, El Dorado Co., to impound tailings in a dry ravine; from H. E. Picket, in the Tiedman Mine, near Georgetown, El Dorado Co., to impound tailings in Marshall Canyon; from Geo. W. Davey, in the Sailor Creek Mine, near Garden Valley, El Dorado Co., to impound tailings in Irish Creek; from Mrs. Bertha Sutton, in the Jackson Creek Mine, near Cromberg, Plumas Co., to impound tailings in old pits; from Simcoe Chapman, in the Dutch Mine, La Porte, Plumas Co., to impound tailings in Rabbit Creek; from Fred Lewis, in the Lewis Mine, on Rich Gulch, Plumas Co., to impound tailings in Rich Gulch; from Fred Scott, in the Arctic Mine, near Butte Valley, Plumas Co., to impound tailings in Marian Creek; from Chas. Y. Hepler, in the Miocene Mine, near Crescent Mills, Plumas Co., to impound tailings in Sneider Gulch; from Ed. Bryan et al., in the Chaparral Hill Mine, near Saw Mill Flat, Plumas Co., to impound tailings in a dry ravine; from the Plumas Blue Gravel Mining Co., in its mine near Nelson Point, Plumas Co., to impound tailings in an old pit and on flat ground; from J. B. Higgins, in the Michigan Hill Mine, near Quincy, Plumas Co., to impound tailings in old pits and on flat ground; from Daniel Conlin, in the Pacific Mine, near St. Louis, Sierra Co., to impound tailings in an old pit; from J. M. McClung, in the Ram Creek Mine, near Brush Creek, Butte Co., to impound tailings in Ram Creek; from George Reese, in the Reese mine, near Redding, Shasta Co., to impound tailings below the mine; and from the Eureka Lake & Yuba Canal Co., in the Farrel Mine, Columbia Hill, Nevada Co., to impound tailings in worked-out pit—gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Nov. 18, 1895, at 1:30 P. M.

And in accordance with law and an order of the Board of Directors made on the 5th day of July, 1895, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Room 12, Rotunda Mills Building, San Francisco, California, on WEDNESDAY, the 4th day of September, 1895, at the hour of one o'clock P. M. of said day, to pay said delinquent assessment thereon, together with cost of advertising and expenses of sale.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors at a special meeting held at the office of the company on September 4th, 1895, the above sale is postponed to FRIDAY, the 4th day of October, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, Cal.

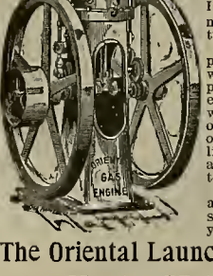
POSTPONEMENT.

By order of the Board of Directors at the regular monthly meeting held at the office of the company on October 3d, 1895, the above sale is postponed to SATURDAY, the 2d day of November, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

POSTPONEMENT.



By order of the Board of Directors at a special meeting held at the office of the company on November 2, 1895, the above sale is postponed to MONDAY, the 2d day of December, 1895, at the same place and time of day.

W. W. SARGEANT, Secretary.

Office, Room 12, Rotunda Mills Building, San Francisco, California.

The Oriental Gas Engine

IS THE BEST because it combines simplicity of construction with power and economy of space.

It can be run with natural or manufactured gas or gasoline.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

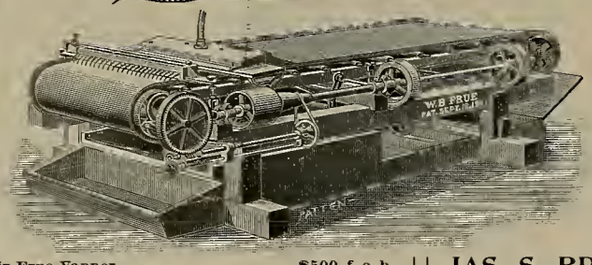
The Oriental Launch is Perfection.

M. A. GRAHAM,
Inventor and Manufacturer,
105 Beale Street.....San Francisco.

WHERE

Do You Get Your Machine Work Done?

A. J. VAN DRAKE is now equipped with the latest improved machinery and tools for doing all kinds of fine machine work, large or small, Gear Cutting, Experimental work, Models, etc. Special attention given and close figures made on manufacturing new inventions in quantities.



A. J. VAN DRAKE,
143 First St., - - San Francisco.

FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner ..... 600, f. o. b.

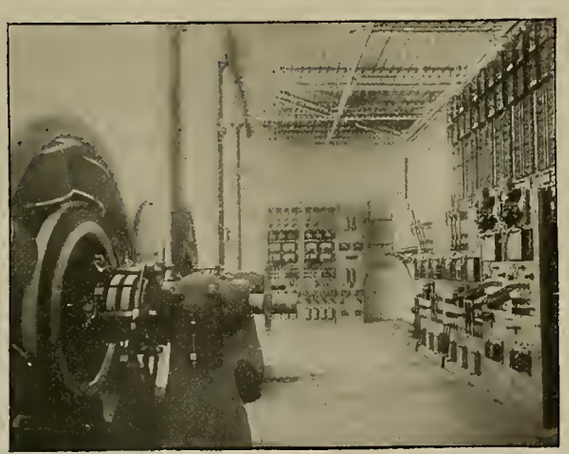
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXXI. Number 20. SAN FRANCISCO, SATURDAY, NOVEMBER 16, 1895. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Portland, Oregon, Power Transmission Plant.



The recent electrical installation at Sacramento demonstrates the practical success of economic transmission of power, generated by the fall of water, a distance of over twenty-two miles. A recent successful electrical installation at Portland, Oregon, presents some new electrical problems which were satisfactorily solved and which are worthy of extended notice. After some delay the necessary revised data have been secured and, with appropriate illustration, are herewith produced. While the source of power in the Portland plant is but twelve miles away from the point of delivery, as compared with twenty-two miles in the case of Sacramento, yet the recent installation in the chief city of our sister State is of equal interest, as will be seen.

INTERIOR OF STATION, SHOWING THREE-PHASE GENERATORS.

The installation was made by the Portland General Electric Company, P. F. Morey, president. The company owns all the water power of the falls on the Willamette river at Oregon City, twelve miles above Portland, which, with a head of forty feet, has a minimum capacity of 50,000 H. P.

In addition to the land covered by the station, the Portland General Electric Company has purchased about 1600 acres in the vicinity. It also controls the canal and locks on the west side of the river, constructed to allow of the passage of vessels past the falls into the navigable waters above, extending seventy-five miles inland. To construct this canal the State of Oregon contributed about $200,000, the balance being supplied by the Portland company.

THE THREE-PHASE, RECEIVING SIDE OF ROTARY CONVERTERS.

THE REDUCING TRANSFORMERS IN THE TRANSMISSION STATION.

The station building is of concrete, stone, iron and brick, and when finished will have a length parallel with the river of 364 feet. The water is taken from the canal, led through an extensive hydraulic installation and discharged into the river below on the other side.

The complete power plant will consist of 20 three-phase generators, and two direct-current generators acting as exciters. The total capacity of the station, therefore, will be 12,800-horse power, divided into twenty units, each one independent of the other.

In order to obtain the best results from the power at its disposal, the Portland General Electric Company selected the three-phase system of electrical power transmission as developed by the General Electric Co., which has proved so satisfactory in the majority of power-transmission installations of varying sizes and varying distances in this country.

One peculiar feature of the Portland installation is the employment of large blocks of power for street-railway service, involving the tranformation of the polyphase current sent over the line into direct current for railway circuits. The frequency is thirty-three cycles per second, selected on account of the large amount of power which it was necessary to convert from alternating into direct current. The current is delivered directly to the line without first passing through transformers, and when it reaches Portland is transformed down to a potential of 400 volts. For the power service the step-down transformers are connected to rotary converters which will deliver a continuous current of 500 volts for street-railway service, as well as for the operation of stationary motors. Induction motors will also be used directly connected to the secondaries of the step-down transformers, when this can be done to advantage.

The generators are of special design and are set upon the floor of the station, the armatures revolving in a horizontal plane, with one bearing at the floor line and another on top of the armature underneath the collector rings. Each generator has twenty laminated poles. The armatures are a little over six feet in diameter and are about two feet high. These armatures are constructed to deliver current directly to the line at a working potential of 6000 volts effective pressure, without the intermediation of step-up transformers. On account of this high voltage numerous precautions were necessary to perfect the insulation of armature coils, to avoid leakage to the ground. The armatures are wound with flat wire and each of the coils is divided into sections, each section being separately insulated. The thoroughness with which the feat of delivering the enormous voltage direct from the machine has been accomplished can be judged by the fact that the armatures were subjected to a pressure of 15,000 volts alternating and were short-circuited and open-circuited under full excitation without the slightest injury.

The field coils are wound for excitation of 500 volts continuous current and each has been subjected to a test of 5000 volts alternating. The regulation in these machines has proved singularly good, the increase from no load to full load being comparatively moderate.

The exciters are set up to allow of the armature revolving in a horizontal plane with one bearing only at the floor line. The construction of these exciters is almost identical with the G. E. M. P. type of railway generator, and each has a capacity of 250 K. W. at 125 revolutions per minute.

(Continued on page 324.)

San Francisco, November 16, 1895.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Portland, Ore., Power Transmission Plant—Interior of Station, Showing Three-Phase Generators; The Three-Phase, Receiving Side of Rotary Converters; The Reducing Transformers in the Transmission Station, 317. Section Through Station Transmission; Direct Current Side of Rotary Converters, 324.

EDITORIAL.—The Portland, Oregon, Power Transmission Plant, 317-24. Work for '95; The Chicago Stock Exchange; The MacArthur-Forrest Patents; Rights of Tunnel Site Locations; "Is an American Mining Boom in Sight;" Idle Capital in England and France; Consolidation of Small Silver-Producing Properties; The South African Mining Bubble; That Constitutional Amendment; Care in the Marking of Mining Locations; Mineral Land Commission for This State; Scientific Progress in Mining Appliances; Value of a Cash Local Market for Ranchers; Dam at the Manzanita Mine, 318.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 322-3.

SCIENTIFIC PROGRESS.—Apyrite; Electrical Vibration on the Ear; Relations of the Eye and Brain in Sight; The Latest Telephone Idea; Scientific Result of the Experiments in Electric Canal Towing; The First Hodgkin Prize for Paper on Argon; Researches of Prof. Dewar in Regard to Liquid Air, 325.

MECHANICAL PROGRESS.—Magnetic Iron Ore; Telephones on Railway Trains; Tells the Story of the Track, 325.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 330.

MISCELLANEOUS.—Concentrates, 319. The Sampling and Measurement of Ore Bodies in Mine Examinations, 320. Notes on Gold Milling in California, 320. Use for Confederate Money; Reasonable Geology; Storage Battery Patents Under Control of a Trust; Steam Power Developed by the Steamships Lucania and Campania, 321. Books Received; Coast Industrial Notes; Personal; Obituary, 323. Notices of Recent Patents, 331.

HOLDERS of mining claims have only forty-five days more in which to do the required $100 worth of work or improvements for '95.

THE Chicago Stock Exchange, by a majority vote, has decided not to establish a mining stock department. The spirit existing there will be the probable result of a Chicago mining exchange.

BY granting permission to the MacArthur-Forrest patent owners to amend their original patent, the English courts have given additional strength to their position. It is evident that litigation on that subject is over in England.

A RECENT COLORADO DECISION in the Rico-Aspen case is important in its bearing on the rights of tunnel site locations, to the effect that such locators cannot cross prior lode locations without consent, and cannot claim lodes discovered within the lines of such locations.

"IS AN American Mining Boom in Sight?" is the title of a three-column article in *Bradstreet's* of Oct. 26. A "boom" is unlikely and undesirable, but it is manifest that there will be an unprecedented era of mining activity in this State, and everywhere else where gold can be secured at less than the cost of production.

SPECULATION is usually indulged in with spare capital. The present speculative South African mining share investments in England and France illustrate the great amount of idle capital in those countries. Legitimate mining as in this country has become as sure a business investment as any form of placing money for return can be.

IN some silver districts, notably in parts of Utah, the year's operations show a tendency to consolidate small silver-producing properties. With increasing economy in mining methods and the saving in management and expense afforded by intelligent consolidation, it is probable that idea will spread. Other industrial enterprises are consolidating and cutting down expenses in a struggle for continued existence, and the abiding shrinkage in the price of silver makes necessary such action on the part of the silver miner.

COLLAPSE of the South African mining bubble seems imminent. It was only a question of time, no country being able to stand such excessive speculation. The rich gold mines of Johannesburg, or the Rand, will not suffer by the cessation of extravagant schemes. There are forty-five gold-producing companies in that one district, and their output and profit are, of course, unaffected by the ephemeral and meretricious stock operations of the past year.

That Constitutional Amendment.

One year ago the voters of this commonwealth affirmed a proposed constitutional amendment, which changed Section 17, Article I, to read as follows:

SECTION 17. Foreigners of the white race, or of African descent, eligible to become citizens of the United States under the naturalization laws thereof, while bona fide residents of this State, shall have the same rights in respect to the acquisition, possession, enjoyment, transmission and inheritance of all property, other than real estate, as native-born citizens: provided that such aliens owning real estate at the time of the adoption of this amendment may remain such owners: provided, further, that the Legislature may by statute provide for the disposition of real estate, which shall hereafter be acquired by such aliens by descent or devise.

Ever since have come continual inquiries from England as to the effect of the above on British ownership of California gold mines. The matter has received considerable notice in these columns, the comment having been somewhat widely reproduced, but it appears that doubt still exists as to the interpretation of the amendment. The question was referred to the Attorney-General of the State, who officially stated that the resident alien is secured by the Constitution in the particular privileges enumerated in the amendment, and may be secured by the Legislature in as many more as it chooses to give; that no existing rights are interfered with, and no law can be enacted abridging the constitutional rights of resident aliens.

Neither in letter nor spirit is there any intent to militate against the acquirement of real estate in any form by foreigners, and any "warning" promulgated in Europe or elsewhere must be ascribed to other motives than desire for the public good.

The federal law on this subject was passed by Congress in 1887, and is as follows:

It shall be unlawful for any person or persons not citizens of the United States, or who have not lawfully declared their intention to become such citizens, or for any corporation not created by or under the laws of the United States, or of some State or Territory of the United States, to hereafter acquire, hold or own real estate so hereafter acquired, or any interest therein, in any of the Territories of the United States or in the District of Columbia, except such as may be acquired by inheritance or in good faith in the ordinary course of justice in the collection of debts heretofore created; provided that the prohibition of this section shall not apply to cases in which the right to hold or dispose of lands in the United States is secured by existing treaties to the citizens or subjects of foreign countries, which rights, so far as they exist by force of any such treaty, shall continue to exist so long as such treaties are in force, and no longer.

The above is simply published as a matter of current information asked for, and is not a subject of present comment.

In relation to the passing of a patent, the following is of collateral interest to the general subject, being the last legal utterance on a question asked in general connection with this matter of alien acquirement of mining property. It is from a decision by the Supreme Court of the State of Colorado, the case being the Justice Mining Co. vs. Lee, and is taken from 40 Pac. Rep., 199:

The grant of a patent to a mining claim from the United States to one who procured it for and assigned it to an alien is the judgment of a special tribunal, and cannot be collaterally attacked. While it is true that the mineral lands of the government are open to location and purchase only by a citizen of the United States, or one who has declared his intention to become such, and the fact of alienage, if raised at the proper time by any one adversely interested, will defeat the acquirement of title, yet the qualifications of an applicant for a patent, as well as the fact of discovery, and the compliance on his part with other requirements made essential by the act of Congress to entitle him to purchase the mineral land of the government, being cognizable by the officers of the land department, when, in the exercise of their jurisdiction, they approve the application, and allow an entry, the fact of citizenship, as well as all other questions of fact, is presumed to have been established, and is not open to review by the courts at the instance of third parties.

RECENT continued and expensive litigation in the case of the Waterloo Mining Co. vs. J. S. Doe emphasize the necessity for care in the marking of mining locations. The boundaries of a mining claim, its exact location, are matters of essential primary record. Any carelessness in this regard will surely make trouble in case the mine proves valuable. The general direction of the vein should be determined in marking the surface boundaries, on the records should appear the course and distance from the discovery shaft to some prominent or presumedly permanent object to secure sure identification. The names of adjoining claims or relative position of contiguous claims should appear. A suitable post or monument should be placed at each corner of the surface ground and at the discovery point should be placed proper designation of the name of the lode, names of locators, number of feet claimed and in what direction. When filed for record, the notice of location ought to give all the foregoing and state if the 1500 feet is on one side of the discovery shaft or point or on two sides; and, if so, how much is claimed on each side. The utmost care is requisite throughout, and, as it doesn't cost any more to have it done right than to have a faulty record, it is best to exercise considerable effort to have the marking, description, surveying and recording done with such exactness that, if any error is made, it is on the safe side, and too much done instead of too little.

THE legislative committee of the Cal. Miners' Association has drafted a bill, to be presented at the coming session of Congress, creating a mineral land commission for this State, similar to that now in existence in the States of Montana and Idaho, except that its membership shall be made up of actual residents of this State, at least one of whom shall be a practical miner. H. R. 8551 of similar wording and intent lacked favorable Congressional committee report last January. It is to be hoped that affirmative action may be had on the proposed bill during the coming Congressional session. There are two or three measures of vital importance to the miners of this State that will be before the National Legislature this winter and that will need united and continuous effort to get through.

SCIENTIFIC PROGRESS in mining appliances has had much to do with the increased gold output. As the country becomes more thickly populated an increasing proportion of the population will turn to mining for investment and livelihood; the improvement in methods and the present efficiency of machinery and the reduction in cost of supplies making possible a profit in many localities where similar operations would heretofore have occasioned a loss. In mining, as in other lines of industry, science is organized knowledge, and is essential to progress or success. Such a plant, for instance, as that at the Standard Con. at Bodie, or now building at the Merced properties in Mariposa Co., or just completed at the North Star, Grass Valley, would have been impossible a few years ago, and the accruing results equally impossible.

RANCHERS in the Okanogan, Washington, country, recognizing the value of a cash local market, are organizing to get and retain control of the Kootenay, B. C., mine trade. Ranchers in some parts of California, not realizing the value of such a market, contribute toward keeping up an organization whose avowed purpose is to destroy their own best market, meanwhile writing letters of complaint that the price of their product is so low, while they appropriate a part of their poor earnings to keep that price down to the present pittance. The California miner is to-day the best cash customer and the best business friend of the California rancher, and when our agricultural brethren realize this, and break away from the demagogues, the agitators and others who live off their earnings and find employment in making and maintaining strife, it will be better for all.

WHEN application to the United States Debris Commission for a hydraulic permit or permission to construct a dam for the impounding of debris is granted, it is with such conditions and limitations as without unduly hampering the recipients make it certain that all the requirements of the law shall be fulfilled, and, in all cases, traveling deputies of the Commission who inspect the work make almost impossible any evasion or violation of the law. One of the largest of such dams is now being built by the Milton Co., employing forty-five men at the Manzanita mine, Sweetland. The base of this dam is over 300 feet; when completed, it will be 150 feet in height. A mile of flume has also been built. The best evidence of the utility of this part of the United States Debris Commission's duties is afforded in the fact that of the number of dams built under the operation of the present law not one has failed to fulfill the conditions under which it was constructed.

Concentrates.

THE altitude of Cepperopolis is 1132 feet.

THERE are now forty-five States in the Union.

"A STATE MINING COMMISSION" is suggested in Nevada.

THE Trinity Co. quicksilver mine last week shipped 404 flasks.

THE California Miners' Association has liquidated all its indebtedness.

TO DATE the dividends of the Boston and Montana Co. aggregate $3,425,000.

J. C. WILLIAMS has a tunnel in 1600 feet at the Golden Drift mine, Magalia, Butte Co.

SIERRA COUNTY miners have sent the State Mining Bureau a relief map of that county.

THE Bellevue, Oregon, mine is reported bonded to the Standard Oil Co. for $200,000.

LAST SATURDAY the Silver King, Utah, Mining Co. paid its regular $37,500 dividend—a total of $412,500 to date.

THREE 50-ton water-jacket furnaces have resumed operations at the Old Dominion copper mine, Yuma, Arizona.

OPERATIONS at the Linderaxa mine, in Calaveras Co., have been suspended so far as the present company is concerned.

THE Lowry gravel claim, near Aqueduct City, Amador Co., is to be worked on a large scale by the owners, Meehan & Co.

THERE are 400 people in the Picacho, Cal., mining district, supported wholly by the placers of that region, crudely worked with dry washers.

AN army of miners, numbering considerably over 50,000 men, is now busy at the first annual assessment work required in three years.

THE superintendent of the Tacoma, Wash., smelter reports an October product of 1710 ounces gold, 33,761 ounces silver and 408,762 pounds lead.

JNO. THEISEN is working on an electric process to reduce the ore and separate the gold and silver from the copper at the Cosumnes copper mine.

THE Gem mine, Wallace, Idaho, closed down last week, throwing 100 men out of work. It is expected operations will be resumed next spring.

COMMISSIONER LAMOREAUX of the General Land Office has approved the selections and classifications of the Montana mineral land commissioners.

THE Tuolumne *Independent* says a twenty-stamp mill will soon be built at the Golden Gate mine. The ten stamps now in use were found insufficient.

HUTTON AND MOTHERWELL, leasers at the Brown Bear, Deadwood, mine, cleaned up $3800 from seventy-five tons of ore, the work of two men for five months.

THE chief gold fields of South Africa, Barberton and the Randt, are not on British territory but in the South African Republic, better known as the Transvaal.

IT is true that up at Forty-Mile Post, Alaska, wages are $10 a day, but when one considers that a man can only work 30 or 40 days in the year it isn't so big after all.

THE case against the North Bloomfield Mining Co., for failure or refusal to make application for a hydraulic permit, has been taken under advisement by Judge McKenna.

THE French Gulch correspondent of the Redding *Searchlight* says the Niagara's good fortune continues, sufficient good ore having recently been struck to keep the mill going for a year.

ILLUSTRATING the great profits of legitimate mining, it is calculated that the net profits of the Anaconda, Mont., copper mine for the eighteen months ending June 30, '95, were nearly $5,000,000.

NELLIE CASHMAN, famous in many mining camps, is in Tucson, Arizona. She was foremost in several "booms," and was long considered a mining mascot, her arrival and sojourn being looked upon as indicative of success.

THE largest reservoir in Idaho is that of the Salmon Gold Mining Co., just completed at Salmon. It is 350 feet long, sixty feet high, and it is estimated to hold sufficient water to successfully works thirty acres of placer ground.

ABOUT forty-five men are finishing the big debris dam building by the Milton Co. at the Manzanita mine, Sweetland. The company formerly operated at French Corral, and expect equally as good results from the Manzanita continuation.

C. M. LANE, who recently bonded for $150,000 the La Fortuna group of mines, sixteen miles south of Yuma, Arizona, in the Gila mountains, says if continued development proves the mine to be what it now promises his firm will build a mill.

THE once prosperous mining camp of Pioche, Nevada, is nearly deserted, there being only a few leasers at work in the mines and some assessment work being done. There are good properties there and need only capital to develop them.

CHOLLAR has levied a 25-cent assessment; the Standard Gold and Silver Mining Co. of Butte county has levied a 3-cent assessment, delinquent December 7; the Carson Creek Mining Co. has levied a 50-cent assessment, delinquent December 10.

THE Raven Tunnel and Mining Company, on Raven Hill, at Cripple Creek, Col., has sold its property for more than $400,000 to C. G. Hathaway, Eben Smith and D. H. Moffatt. One of the mines of the company is the Raven, which has produced over $200,000.

THE Buchanan Mining Co., near Sonora, Cal., proposes to build a dam in Hunter canyon and put in an electric plant there. It is their further intention to work the Hunter mine in connection with the Buchanan. P. J. Sullivan is the secretary of the company.

THE Lance Mining Co. has incorporated at Medford, Or.; J. W. Odgers, A. N. Berlin and C. J. Hall, incorporators; capital stock, $60,000. The company has bonded 700 acres of placer ground in Foots Creek district, and will commence to develop the property.

TWENTY-SEVEN placer claims near the head of Grande Ronde river, thirty-seven miles northwest of Baker City, Or., including 540 acres, have been bought by the Grande Ronde Placer Mining Co., a Paris, France, organization, for about $50,000. Thos. Markum of La Grande, Or., is the superintendent and manager. Extensive improvements will be made this season. A local paper says $10,000 has been placed in the La Grande bank as a starter.

PUMICE-STONE MINES are something new, the commercial supply heretofore coming from Europe at a cost laid down of nearly $100 per ton. T. B. Crocker has a mine of pumice-stone in Utah, 200 miles south of Salt Lake, and says he can furnish it in unlimited quantities.

THE Pioneer Reduction Works of Nevada City now use crude petroleum as fuel, receiving tank cars of 5000 gallons each week from the Union Oil Works at Santa Paula. The oil is drawn in 100-gallon tanks at Colfax for shipment over the Narrow Gauge railway.

THE Virtue mine, near Baker City, Or., sent to that place a $13,000 clean-up, the result of less than a month's run. An electric-light plant, an air compressor and a large pump have just been added to the property. A great deal of development work was done last month.

AT the Jones mine, on Carson creek, near Angels, a twenty-foot ore body is reported on the 400-foot level, of extraordinary value. Twenty stamps are to be added to the forty already there. A. D. Remington, of Watertown, N. Y., recently acquired an interest in this property.

THE Chloride Hill Mining and Milling Company has incorporated at Davenport, Wash., to develop and explore four mining claims in Stevens county, in the vicinity of the Cleveland and Deer Trail No. 2. The principal place of business will be at Davenport: capital, $384,000.

DURING October the Standard and McGill quartz mine near Greenville, Plumas Co., produced $14,000, $10,000 of which was profit. The owners contemplate building a mill in the canyon below the mine. So far they have had the ore crushed by 15 stamps at the Kettle mill, one-half a mile from the mine.

HAVING acquired many of our California miners, the South African people now reach out for education in other branches, and advertise for primary school teachers, to whom they offer $800 per annum for three years. So far as California is concerned, the inducements in this case do not appear to be sufficient.

THE U. S. Debris Commission last Monday granted hydraulic mining permits to N. C. Tully, owner of the Omega mine, near Washington, Nevada Co.; W. A. Morse, owner of the Muggensville mine, and Henry H. and A. A. Mayer and John Costa, owners of the Argentine mine, near Downieville, Sierra Co.

THE Golden Bar Steam Dredging Co. has incorporated at Cheyenne, Wyoming. The company has secured a thousand acres of gravel bars along Snake river in the Jackson's Hole region, and will place two large steam dredges at work on the property early in the spring. The ground has been tested and is said to be rich in gold.

THE bond on the Congress mine entered into two years ago by an English syndicate expired on the 1st. It is said that an extension of the bond will be given and that representatives of the syndicate are now en route from Europe. The new bond is reported to be for $3,000,000. The mine belongs to the Diamond Joe Reynolds estate.

IN southern Oregon 25 men are employed at the Illinois river copper mines at present. The smelting plant has been hauled in over the four-foot grade built from Deer creek, and preparations are being made for roasting ore, about 500 tons of which lie on the dump. The company will put a wire suspension bridge across the Illinois river.

A CHINESE STOREKEEPER of Honolulu, Siskiyou Co., is the principal owner of the Benz Bar claim at Klamath river, employing forty-four men, some of whom are Caucasians. He says his countrymen don't want any more mining claims, as no young Chinese can come to this country, and those now here are too old to open any new claims.

THE report of the directors of the Montana Mining Co. of Marysville, presented at the meeting in London, October 31, covers the operation of the company for the half year ending June 30, 1895. The receipts for that period were $397,617; the total expenses, $297,719. A new Reidler pump was installed during the six months at an expense of $23,000.

ABOUT a year ago Jno. S. Doe brought suit against the Waterloo Co. for possession of the Red Jacket mine in San Bernardino Co., alleging that the original location had not been properly made. Judge Ross of Los Angeles decided in favor of the defendant company. On appeal, the U. S. Circuit Court in this city last Saturday affirmed Judge Ross' decision.

DURING the year ending September 30th, 1895, the Eureka Con., at Eureka, Nev., shipped to Salt Lake 1500 tons of ore and 11 tons of jiggings from the furnace dumps, extracted on the tribute system, all the work in the mine having been performed by tributers excepting the timbering, tracking, etc., that was necessary to keep the main levels and shaft in condition.

ON the 5th the Schroeder quartz mill on Deadwood mountain, nine miles south of Yreka, was destroyed by fire, including machinery, part of the tramway, and all the buildings except the old boarding house and the stable. This mill was one of the best equipped in northern California, having improved quartz machinery, and was valued at over $30,000, upon which there is an insurance of $15,000.

ELECTRICAL progress and efficiency emboldens swindlers to flood the country with plausible statements of unworthy schemes called "electric." Sometimes the "invention" is represented to cure disease, sometimes to prevent it. A Boston Co. is now trying to take the census of the fools in the country by advertising an "electric mine indicator," a sort of divining rod or dousing stick scheme.

A RECENT legal decision regarding mineral locations is to the effect that an application may embrace several locations. Conflicting rights set up to defeat an application cannot be recognized in the absence of an alleged surface conflict. In the absence of a clear showing as to possessory right, patent must be denied. Survey must be made by actual measurement on the ground.

AT Thompson, Mont., the Montana Antimony Mining Co. is working a 15 per cent antimony ore, with a small furnace and concentrators, and figures cost of mining $5 per ton; concentration, $1.20; refining, $3; shipping, $3; total, $12.20 per ton, leaving a net profit of $11.80 per ton. With better facilities the company claim they could get the entire cost down to $8.50 per ton.

AT Salt Lake, Utah, the Germania Smelting Co. claims to have reduced the cost of roasting from 60 cents to 28 cents per ton. The new roaster is of the Keller patent and is the only one in the Territory. It is a continuous furnace; the application of the flame is regulated so that the fire is controlled on any one of the different platforms which go to make up the roasting capacity of the plant.

A VIRGINIA CORRESPONDENT of the Genoa *Courier* claims to be possessed of positive information of "a single body on the 1600-foot level of the Consolidated California and Virginia mine that is good for ten or twenty years. It is cut by a crosscut 160 feet in width on that level and about 300 feet in length and extends two or three levels up and down on the slant of about 45 degrees and will average $8 or $10 a ton."

THE North Star works, on Massachusetts hill, Grass Valley, are about ready to begin operations. A full account of the plant appears on page 130 of the issue of August 24, '95. The constructing engineer estimates the expense for power will not exceed $36 per H. P. per annum. Pumping out the old Rocky Bar mine through the Brennan shaft will begin about January 1st, '96. This will necessitate the drainage of nearly the whole of Massachusetts hill.

TWO SALT LAKE men have secured a patent on a traction engine which is especially designed for the transportation of ores from the mines that lie distant from the railroads. It is understood it is to be given a trial by one of the big mines of Utah. It is different from any other traction engine in that it is equipped with a sort of rolling track eight inches wide, within which the drive wheels revolve. Its capacity is 100 tons at from six to fifteen miles per hour over ordinary roads.

H. W. BLAISDELL of Yuma has bought the Warrington and Little Angel mines at Havilah, Kern Co., for $5000, and proposes to sink a 300-foot shaft. The Ophir, May, and the two Canty mines are reported sold to G. Roher of Pomona and H. Mead of Los Angeles for $10,000. J. C. Coulston of Erskine Creek has bought the Rochfort, near Havilah, for $2500; Ezzell, Patterson and Gillis have bought the Portuguese mine, on Kern river, six miles from Havilah, for $3500.

GEORGE MORRIS, express agent and assistant postmaster at Chinese Camp, was shot and killed by two robbers last Saturday. Five thousand dollars in coin had been shipped from Oakdale to Angel's Camp. In changing horses for the stage at Chinese Camp the express agent took charge of the money until the stage came back from the stable. The robbers ordered Morris to throw up his hands, but in place of doing so he shot at them. One of the men, who had a shotgun, returned the fire and riddled Morris' body with buckshot. They fled without taking the money, and Morris died three hours later.

THUS says the Spokane, Wash., *Chronicle:* "The occasional kicker who growls because 'England is buying up all our mines' doesn't know what he is talking about. England may keep on buying mines in this northwest country for the next twenty years, and still we will have plenty to sell. As a rule, every time these British capitalists pay a few hundred thousands for a property a good share of the new money should find its way back into the same or a neighboring district to develop a couple of prospects into mines just as good as the first. At the present rate of discoveries England will need to mortgage India and put Ireland up at auction if she intends to buy all the mines that can be developed within a couple of hundred miles of Spokane."

IN the case of Morse vs. Deadro the Supreme Court of this State decides that, "independent of the acts of Congress providing a mode for the acquisition of title to the mineral lands of the United States, the term mining claim has always been applied to a portion of such lands to which the right of exclusive possession and enjoyment, by a private person or persons, has been asserted by actual occupation, or by compliance with local mining laws, or rules, or customs. The words 'mining claim' as used in the law have no reference to the different stages in the acquisition of the government title. In our opinion it includes all mines, whether the title is inchoate, as in the case of a mining claim in its strict sense or perfect as in the case of a fee simple title."

THE following from the New York *Mail and Express* of the 13th is reprinted simply to indicate the feeling in the East. The *Mail and Express* is a conservative journal, usually free from sensationalism: "Clarence Mackay, who arrived last week, went back to Europe to-day. Mr. Mackay Sr. is busily engaged in closing up some large mining contracts and cannot be absent from America for any length of time just at present. It is stated this astute mine owner looks for a revival of European interest in American gold-mining properties as a result of the late Kaffir craze in Europe. Fortunes made in that excitement, which are already beyond the power of any panic to touch, are so numerous that it is hardly to be supposed mines elsewhere which are better than a majority of the Kaffir properties, will fail to come in for a share of attention from this large class, which knows what a good mine is. With new methods of working and superior facilities for transit offered by American properties, we ought to have a gold-mining boom with which the Comstock excitement of the '70s would look like a microbe beside a mammoth."

DISCUSSING the Montana Co.'s report, the London *Mining World* of October 26 makes some editorial remarks which illustrate the feeling in some British minds. It says: "With such litigation as the Montana has just successfully contended, English shareholders who hold good mines in the United States are not unfamiliar. This probably is one of the reasons making it most difficult to float an American mine on the English market. If the mine prove a bad one (and most of them do that come from America), then the English shareholders are left to work it at their loss, and if it prove a good one, then a lot of trumpery claims are set up against its title. This was the case with the Richmond, and oceans of money were spent in law that might have been divided amongst the shareholders. It was also the case with the Flagstaff in its palmy days, and it will be the case with other American mines if English shareholders put their money in them and they turn out to be profitable." It would be difficult to compress more prejudice and unfairness into a paragraph. Even the Nevada and Arizona mines mentioned in no way justify the untenable conclusion. The excerpt shows the truth of the assertion that the mind of a bigot is like the pupil of the eye; the more light you pour upon it the more it contracts.

The Sampling and Measurement of Ore Bodies in Mine Examinations.

NUMBER IV.—*Concluded.*

By EDMUND B. KIRBY.

Rapid approximate methods are frequently used for preliminary estimates, or to check the results of detailed measurement and sampling, or to determine probable ore, or in estimating the chances for further discoveries, etc., etc.

Sometimes the conteuts of an ore shoot or body are estimated from the average yield per unit of area or length of other portions already worked.

Again, a continuous sheet of ore is sometimes so intersected by mine workings as to expose and prove the sheet within the area bounded by a line circumscribed about these workings. It may then be unnecessary for the purpose in view to estimate each block separately. The entire area which is considered proven is measured as a whole, and the number of square feet of vein area excavated by the workings is also measured and deducted. From the total yield of the area already worked, that of the remaining portion may oe calculated.

When this quick method is applied with judgment, to the proper conditions, aud the actual figures of production are knowu with *certainty*, its results agree very closely with those of detailed measurement and sampling, and are often used to check them.

Dumps are measured by ordinary cross-sections, but since they are generally on an inclined hillside, it is not always convenient to measure from the horizontal base plane of an instrument. A string or line of sight between the two poles is often preferred, and is accurate enough for the purpose. Irregular sections are always plotted.

THE REDUCTION OF VOLUME TO TONNAGE.

This is done by using the factor of cubic feet per ton for the ore in question. This factor is derived in two ways:

1. This method is applicable only to ore composed of simple minerals or simple rocks or their combinations in known proportions. A safe margin is always added to the theoretical result because the standard specific gravities given are the figures for pure, dense, crystallized specimens, while in ore deposits the minerals are often more or less altered and somewhat amorphous and porous.

The following table gives the calculated figures for these minerals and rocks of which ores of the precious metals are mainly composed. The first columu is the theoretical result, calculated from the average specific gravity, and the second gives a general figure for practical use:

NUMBER OF CUBIC FEET PER TON.

MATERIAL.	Number of Cubic Feet of Solid Material in Place, Per Ton of 2000 Pounds.	
	Theoretical Figure Calculated from the Average Specific Gravity. (For Pure Unaltered Specimens.)	A Figure for Practical Use.
Galena	4.3 cu. ft.	4.7 cu. ft.
Pyrite	6.4 "	7.0 "
Blende	8.0 "	8.5 "
Hematite	6.6 "	7.5 "
Limonite	8.4 "	9.4 "
Dolomite	11.4 "	12.5 "
Limestone, Andesite, Syenite	11.9 "	13.0 "
Vein Quartz, Granite and Granitic Rocks	11.9 "	13.5 "
Clay, Quartz, Porphyry, Trachytes, Rhyolites, etc.	12.3 "	14.5 "
Vein Quartz, with 15% Galena	10.7 "	12.2 "
Vein Quartz, with 15% Pyrites	11.1 "	12.5 "
Vein Quartz, with 10% Hematite	11.4 "	12.9 "

Figures thus assumed from calculation are always applied with much caution aud jugöment, because wheu rocks are so impregnated as to become ores they are generally full of small fractures and may be spongy or porous. The figures for practical use are calculated from the minimum specific gravities given by the authorities, with an addition of about 5% for variations, crevices, cavities, etc.

2. Oxidized ores are generally amorphous, loose and porous, and cannot be calculated. Their volume is therefore determined by practical test by any of the following methods:

In a thin sheet the ore may be stripped and several tons broken down and weighed, after carefully measuring the thickness and area broken down to determine its volume.

In a mass of ore the writer has used the figure obtained by carefully stopiug the right rectangular prism to be filled by one "square set" of timbers.

The determination is made on a small scale by filling a bucket, tub, or box, of measured volume with weighed, coarsely broken ore, and then pouring in water level with the top of the ore. The total volume occupied is then measured, the water is poured off and its volume measured; the difference being the volume of the solid ore. Occasional determinations of this kind on various ores soon make it possible to select a safe factor in most cases by judgment, since the principal object is not scientific accuracy but safety.

Loose ore piled on dumps in pieces from head to gravel size will have from 35% to 50% of interstitial spaces, the percentage being greatest if the lumps are somewhat equal sized. Thus a dump with 40% of spaces, and composed of ore averaging 12.7 cubic feet per ton in place, will measure 21.2 cubic feet per ton.

ESTIMATE OF THE TOTAL NET VALUE.

The net profit, or *net value* of the ore measured aud sampled is generally figured by the ton, either by a separate calculation for each individual block, ore body, or shoot, or by one calculation for the entire mine. Conditions are generally uniform enough for the latter plan. The tonnage of ore measured is only what will be actually broken down. The sample assays represent this measured ore as it will be when broken, and before it is sorted, either under or above ground.

The methods of calculating the net value of this ore from these data vary with every case, but their details are not of interest here. It is, however, necessary to call attention to the four principal factors which usually enter the problem, aud the variations in calculatiug each factor.

THE FOUR PRINCIPAL FACTORS COMMONLY USED IN MAKING ESTIMATES OF TOTAL NET VALUE.

I. *Gross or Assay Value* per ton. This is always figured on the "ore broken," and from the assays and analyses. It is either:	1. *Full Value*, according to N. Y. quotations for the valuable metals contained. 2. *Partial Value*, with various losses, expenses and deductions subtracted here.
NOTE:—The assay value of various products from the ore broken is often required, such as: (This is determined by calculation or by special tests.)	1. *Ore Milled*, after some sorting. 2. *Sorted Ore Shipped.* 3. *Concentrates.*
II. *Losses* (to he deducted from the assay value) are either expressed per ton, or as a percentage of the "assay value." They comprise either:	1. *All the Losses.* 2. *Part of the Losses*, remainder being placed in I or IV.
III. *Tonnage* used is either:	1. *Ore Measured*=ore broken. 2. *Ore Hoisted*=the ore broken; often after it has been reduced somewhat by underground sorting. 3. *Ore Shipped*=the ore hoisted; generally after it has been further reduced by sorting on the surface. 4. *Ore Milled*=either the ore hoisted, or this reduced by further sorting.
IV. *Cost*, per ton, may he figured on either of the above tonnages or on that of the products, such as concentrates, etc. It includes both:	1. *Cost of Mining* — Including general expenses and "development" only so far as they are required for extraction of the blocked ore "in sight." 2. *Transportation and Treatment.* Some of the losses and smelter deductions from assay value are often included here.

It is to be noted that each one of these four terms is meauingless unless accompanied by a full explanation of how it is figured.

In estimating losses on milling ore it is not often safe to deduct a given percentage, but the loss should be expressed by a definite number of dollars per ton. The reason for this is that the loss in such ores is generally quite constant, and bears little or no relation to their original contents.

The accuracy with which a sample is made to represent its liue should be somewhat proportioned to that with which this line represents its area, and the area its volume. At the same time, since the limit of error in the sample is controllable, it is kept much less than the possible errors of area and volume, which are fixed by the conditions of the mine.

The possible error in the estimate of a block must be provided for iu one of two ways. If there are a number of blocks uot differing greatly in value, their errors will balance according to the probability of averages. If there are but few blocks, or the value of some one is so great that its possible error will be a large perceutage of the final total estimate, a safety deduction is made to cover this possible error. The necessity for this deductiou and its amount are matters for experienced judgment. Probably every one engaged in this work has had occasion to notice the danger in an estimate of ore in sight, based upon a siugle block, the variatious of which are not balanced, and in this case a liberal deduction is often necessary for safety.

Fraud in some form, generally from salting samples, is a danger often possible, and every engineer devises his own private system of safeguards, but no system can do away with the necessity for constant care and vigilance.

Notes on Gold Milling in California.

NUMBER I.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

The system of reduction of gold-bearing ores with stamps, as at present carried out in California, is the result of progressive improvement during the past forty-four years. The first successful mill in this State was built in the winter of 1850–51, and used steam for power.

Starting with the ancient Mexicau arrastra, crushing, with the help of a mule and one man, a few hundred pounds of ore at a charge, we have progressed to the present aggregation of mechanical appliances, as seen iu the modern stamp mill, requiring great motive power, aud disposing of hundreds of tons of ore iu the course of a day. This progression is largely the result of accumulated practical experience on the part of the designers and builders of mills, as well as of the millmen in the handliug of the various gold ores. Of late years scientific investigations have greatly aided in improving both the process and the mechanism.

That the results accomplished have been of economic value is evident from the fact that while formerly a yield of 30 to 40 per cent of the total gold in the ore was the average obtained, the best mills of to-day are able to more than double these figures. That our methods may still be improved upon, and the margin of wasted gold be further narrowed down, is the point for which all intelligent millmen are striving. While the stamp mill itself had been used for crushiug ores long before the discovery of gold in California, since that time it has been greatly improved in detail, and its capacity and efficiency increased, hence what is known as the "California gold mill" is a very different affair from the clumsy mills first used for crushing quartz in this State. The California gold milling processes and the California millmen are, as a result, finding due recognition outside of their own immediate field of operation, as is evidenced by the increasing outside and foreign demand for our men and milling machinery. The development of the milling process, keepiug pace with the improvement of the machiuery required for ore reduction, has had the beneficial effect of greatly lessening the working expenses, permitting ores of a low grade to be worked at a profit. California has a great abundance of this class of ores, comparatively untouched, and these must be mainly relied ou in the future as the sources of the precious metal. Already, under extremely favorable conditions, ores are being mined and milled in California at a cost of 50 cents per ton, as at the Spanish mine, in Nevada county, where, with Huntington roller mills, ores yieldiug 85 ceuts per ton have been worked at a profit.

When assured of a constant and sufficieut supply of ore, it is of the greatest importance that the site for the mill should be chosen with due regard for economic treatment. This necessitates the observance of the following points: The means of transportation of the ore from the mine to the mill, which should be done automatically, or at least with as little handliug as possible, conveying the ore at once to the highest point in the mill, so that it will descend by gravity from one to the other in all the different consecutive operations. Another important feature is to provide sufficient space for capacious ore bins, which are necessary to prevent a stoppage of the mill through a lack of ore, caused through unavoidable delays iu the mine or along the roads. The accessibility of the mili site as regards fuel, water, or electrical transmission, according to the motive power to be used, and their continuity and cost at all seasons of the year, must likewise be considered. The possibility of placing the levels for the different floors on solid rock foundations should be investigated, as stability of the machinery is most essential for successful milling.

The ideal site would be to have the mill in close proximity to, but below the level of, the collar of the shaft or the mouth of the tunnel, on sloping ground, where the ore can be delivered directly from the mine to a "grizzly" on the upper floor of the mill, to be passed later, without rehandling, through the crushers, ore bins, self-feeders, mortars, etc., while leaving sufficient space for a waste dump. For a mill arranged in this manner, including concentrators and canvas platform, 40 feet of fall should be available. If chlorinatiou works are also to be used, a greater fall is desirable.

After deciding ou a suitable site, the surface should be removed down to the bedrock aud leveled off for the different floors. Solidity and accessibility are the chief points to be observed in placing the different parts of the mill. Where required, heavy stone walls should be erected as buttresses. The foundation for the mortars and the proper erection of the battery frames are points requiring particular attentiou. For the mortar block a trench is prepared of suitable depth, preferably in solid bedrock, proportioned to the height of the block, and wide enough to leave about 2 feet of free space around

*Bulletin No. 6, California State Mining Bureau.

it, which is later filled in with concrete or tailings from the battery. These mortar blocks vary from 8 to 15 feet in length and are dressed at the upper end to the size of the bed plate of the mortar. In California they can be obtained frequently from a solid cut of a pine tree, or else consist of two or three sawed blocks fitted and bolted together; but where clear timber of the requisite size is difficult to obtain the block can be constructed of 2-inch plank, as is done in the Black Hills in Dakota. There the bottom of the trench for the block is leveled and some sand tamped down, on which two layers of 2-inch plank are placed crosswise and spiked to each other, and made perfectly horizontal. On this foundation a mortar block is constructed of 2-inch planks, from 11 to 14 feet long, according to the depth of the trench. The planks, which should be of clear lumber, and varying breadths (in order to break joints), stand on end, with their width parallel to the long side of the mortar. They are spiked together and fastened above and below with binders and bolted to each other by transverse rods; the upper binders (8x12 inches) being even with the top of the mortar blocks; the lower binders (12x12 inches) are 3 feet lower.

The top of the mortar block should be planed perfectly true and leveled, and where several blocks are placed in line all the blocks should be sawed off to one height. Before setting the mortar upon the block a sheet of rubber cloth, ¼ inch thick, should be placed between, or, when this is not obtainable, two or three folds of mill blankets, well tarred, will answer the purpose.

The mudsills should be of square timber, free from sap, bedded in concrete on the bedrock and secured by anchor bolts to the foundation; the also should be bolted to the linesills.

The uprights of the battery frames are supported in various styles: with diagonal braces and hog chains at front or back, or with so-called knee frames. In the former style the brace is placed on the same side as the counter shaft, which rests low down on the battery sills. This style is well suited for small mills using stamps not to exceed 750 lbs., but for large mills using heavy stamps the knee frames are the more suitable, with the counter shaft on a level with the cam shaft. What is known as the reverse knee frame forms a strong, compact construction, but requires the counter shaft to rest on the battery sills behind the frame.

The battery posts are made 24 inches deep and from 12 to 20 inches wide, the center one of a ten-stamp mill being made the heaviest, as having to bear the greatest strain. They are let into the sills and secured to the line timbers by bolts. Besides the braces, the posts are given stability above the mortar by the guide timbers, which extend from end to end in one piece, and are let into the posts to which they are bolted. The lower one is placed about six inches above the upper edge of the mortar, and the center of the upper one is about 3 feet from the top of the post. The seat for the cam-shaft bearings is cut in the upper part of the posts.

After lowering the mortar on the block, with the planed bottom resting evenly on the sheet of rubber cloth or folds of tarred blanket, it is fastened perfectly rigid by eight bolts, four on each long side, passing through the flange, which is cast on the bottom of the mortar. This flange is 4 inches wide and about 2½ inches thick. The feed floor should be high so that these bolts can be conveniently reached, to permit their tightening when required. The journals for the cam shaft, which are placed in the recesses cut out of the battery posts for their reception, are lined up and "babbitted" prior to receiving the cam shaft with its cams. The stems are placed from ½ to 1 inch from the cam shaft, and just far enough from the cams to clear them when dropping. The cam shaft is made of wrought iron or soft steel, from 4½ to 5 inches in diameter, turned true, and should have key-seats for securing the cams. There should be two key-seats, and placed one-third of the shaft circumference apart. At one end of the cam shaft the cast-iron "hub" of the belt pulley (with flanges) is keyed on. This pulley is built of wood, and turned true on the shaft. Where there is more than one battery to the mill, it is best to have a cam shaft for each ten stamps, as this permits of repairs, such as changing cams, etc., without stopping more than ten stamps.

(To be Continued.)

Use for Confederate Money.

"Did you ever know what has become of the greater part of the Confederate paper money with which this country was flooded some years back?" asked a local business man who had just returned from a trip to the Atlanta exposition. "No? Well, neither did I until I struck Atlanta a few weeks ago. In that town I found an old man who makes a business of quietly gathering in all the Confederate bank notes he can find. You know the stuff was issued by the ton during the war, and there is any quantity of it still floating around. When the old man gets a big bundle of the paper he sends it to Edison, the inventor, who pays a good price for it; Edison uses it to make carbon for incandescent lamps. The paper upon which the Confederate notes were engraved was made of the pulp of sea grass. This branch of the paper making industry has since become a dead art. Sea grass paper, when chemically treated by Edison, has been found to make the best sort of carbon for incandescent lights, and so there is always a demand for Confederate bills."—Denver Mining Industry.

Reasonable Geology.

NUMBER IV.

By FREDERICK DANVERS POWER, F. G. S.*

The result of a single experiment is not sufficient data to form a conclusion on; we require to confirm it by repeated experiments, so as to exclude all errors. Pyrites is frequently mistaken for gold because of its yellow color, and many disappointments have been caused by those who have mistaken quartz for diamonds, on account of its transparency, and the fact that it will cut glass, tests for its other qualities being considered superfluous. Ignorance of the qualities of what one is about to test have resulted disastrously, as in the case of those who confound hardness and toughness, and to test a diamond—which is really very brittle—have crushed it with a hammer on a blacksmith's anvil.

Artificial experiments enable us to discover and learn the properties of entirely new substances. Mere observation would never have led us to suspect the presence of the metal aluminum in clay.

Experiments may be conducted with scrupulous care, and still be of little value in themselves. If by accurate analysis we determine the presence of minute quantities of certain metals in a rock that occur in larger quantities in veins running through that rock, some one would at once conclude that the ore was concentrated from the surrounding rock; but after all this is only a hypothesis, which has not been proved. Another man may assume, with equal reason, so far as information gained from the analysis is concerned, that the vein has supplied the rock with these particular minerals, or that the rock is simply a medium through which ore passes from its source to the vein. If on further observation we note that shoots of ore are more frequent, richer, or confined to that portion of the vein which passes through certain rocks, and that these rocks are found, on analysis, to contain more of the metal than its neighbors, then the original hypothesis is strengthened, but still not proved, for there may be something in the rock that tends to attract or precipitate these particular minerals. We may note other facts, however. Perhaps we are able to limit those metals whose origin we are seeking to certain minerals in the rock, of which they may be a necessary or accidental constituent, that near the shoots of ore the rock is decomposed, allowing a more ready passage of water than the tighter undecomposed rock, and that the original mineral in which our metals occurred when fresh is altered, and the metals wholly or partly missing; the veinstone is also found to partake of the nature of the rock through which it passes. These and many other facts collected, little or nothing in themselves, when combined together, especially when tending in the same direction, help to verify our hypothesis.

Different effects may be caused by varying quantities, such as temperature, strength of solvent or reagents, motion, pressure, time, etc. Salts held in solution when under great pressure are precipitated when relieved of that force. It is our knowledge of the strength of solutions that enables us to tell with more or less accuracy the conditions under which salt and gypsum beds were deposited. By the fractional evaporation of a solution containing sulphate of lime and sodic chloride, first, the most insoluble salt is thrown down as gypsum, and then the common salt. If a flood took place periodically which brought fresh quantities of water into the basin, we would expect it to be marked by alternate layers of gypsum and salt, and, under certain circumstances, mud.

When by careful experiment and observation we have exhausted all our resources, and have ascertained the effect of surrounding things on the object we are investigating, we may then generalize, or infer that what we know to be true of a few things is also true of the whole class to which the few belong.

Many experiments have been made in connection with mountain building to prove certain theories. First, cloth was the material used, several layers of which were laid one over the other; when pressure was applied to the ends a corrugated surface was formed, which in some respects imitated ranges of mountains. The substance employed did not sufficiently approximate that of rocks; cracks and fissures did not appear; the tops of the artificial mountains were always anticlinal; whereas in nature, when of sedimentary rocks, they are frequently synclinal, and when the cloth was relieved of the pressure it fell back to its original position. Ordinary sandstone and slate could not be employed, as on the small scale allowed for such experiments they were practically unbendable. Other experimenters, such as Daubree, Favre, and Cadell, used substances that conformed more to the requirements of the case, and obtained, not only elevations, but also representations of other phenomena connected with mountain building; they also brought various forces into action, which assisted in making clear many obscure points. Professor A. Favre used a sheet of india rubber covered with a layer of potter's clay in a plastic condition, which was confined at the ends by wooden supports which moved with the rubber when it contracted, thus giving the necessary lateral pressure. H. M. Cadell considered the rocks as rigid, not plastic bodies like cloth or clay, so employed layers of damp sand, foundry loam, and, in a few cases, clay, with the laminæ of dry stucco powder between, laid down on stout wax cloth. Our knowledge of mountain building is almost confined to experiments such as these.

We often hear miners say that one cannot see an inch further into the ground than the pick's point penetrates, and that, therefore, the wielder of the pick is the real discoverer of rich fields, and not the boss who goes about with his hands in his pockets and directs them where to work. No one wishes to deny that the physical eye is unable to pierce the rocks, but our mental one frequently can. By reason we are able to ascertain the nature of a thing without actual trial, for the same causes under similar conditions will have the same effect. Of course, we must make sure that what we take as a standard is like what we compare with it, otherwise we would go wrong at the start; but it is not always easy to know when circumstances are the same. A geologist, by keeping his eyes open, can often form a very fair opinion of the nature of a deposit from its outcrop, or from the opening developed by costeening. He takes every little thing into consideration, from the vegetation, soil, secondary minerals, to springs of water and nature of the outcrop, general physical and geological features of the district, and, if there are any neighboring mines, from their underground workings. As a parallel case, might be taken that of a physician. When he examines his patient he does not deem it necessary to cut him open to ascertain the nature of a fever; he tells from external appearances, taking the temperature, noting surrounding conditions, and other indications, what the man is suffering from. But as in some cases the trouble is not discovered until after a post mortem, so before determining certain obscure points in geology one must have recourse to mining operations. A doctor is often baffled by the deceit and untruthfulness of his patient, who conceals certain facts that should be made known to his medical adviser; but an inanimate object, having no will of its own, is subject solely to the laws of nature, which it is our business to master. An unobservant miner is, to all intents and purposes, simply a machine in the hands of his boss, and has no more right to be considered the unraveler of geological problems than a rock drill that actually penetrates the rock, or the explosive that shatters it. It is often pure chance that one man is set to work in a particular place rather than his neighbor, and although he performs necessary work in turning over the pages for the geologist to read, no credit, on account of perspicuity, is due to him. It is quite an erroneous idea to think it is necessary to carry out a test in a direct manner in order to secure a correct result; it is neither indispensable nor always feasible to do so. The height of an inaccessible tree is more readily obtained by angular measurements than directly with a tape.

In order to solve a problem, whether physical or chemical, we form an ideal in our mind, and try to carry out the conditions in our experiments that we believe to have prevailed. These conditions are frequently of a complicated nature, which necessitates a series of tedious experiments carried out methodically and systematically—first, in an elementary state, and subsequently in combination. There is a difference between possible and probable hypothesis. A man wishing to prove a theory will naturally select such experiments as will fit in with his views, and may even produce the results he seeks, on a small scale, and yet the environments in nature of that which he wishes to demonstrate may be entirely different from those he assumed in his experiments. If still biased in favor of a pet theory, he may quietly ignore or distort adverse facts, knowing full well how difficult it is to distinguish partial truths, and that dogmas more than half false often pass current for a time as universal truths. To be able to judge correctly of facts requires a well-balanced mind, so that one can pick out real from supposed examples, and avoid generalizing on exceptions, or confounding coincidences with necessary conditions.

(To be Continued.)

*London Mining Journal.

THE storage-battery patents of this country have passed under the control of a trust, the Electric Storage Battery Company; capital $10,000,000; headquarters in Philadelphia.

Seaboard says "that the great manufacturing city of New York uses only about five times the steam power developed by the engines of the steamship Lucania or the Campania."

Mining Summary.

CALIFORNIA.

Amador.

MAHONEY-WILDMAN.—*Ledger:* V. S. Garharini has the contract to put twenty stamps of the old Mahoney mill, in running order. Some time ago twenty stamps of the original mill were started up and when these are running the entire forty, the capacity of the old mill, will he in operation.

SOUTH EUREKA. — The twenty-stamp mill at the South Eureka has heen pounding away on quartz for a couple of weeks and the clean-up will he made in a short time, after a twenty day's run. Water is used for power at the mill and steam at the hoist.

THE ALMA.—At the Alma mine everything is being done to get matters in readiness to continue sinking. Wood, timher and other supplies are arriving daily and the work of pushing the shaft to a depth of 1000 feet is hegun.

THE ARGONAUT.—The compressor huildirg at the Argonaut is completed and the compressor is installed. The new hoisting machinery is all completed and will he put to work hefore the end of the year, for when the water in the mine requires much power to handle it the engine now in use will hardly he able to do the work. The shaft is now down ahout 975 feet.

Calaveras.

THE MARSHAL MINE.—Angels *Echo:* The Marshal mine in this town, known also as the Bovee mine, now under the management of Nate McKay, is one of the richest mines on the mother lode. In early days this mine was worked hy the Winter Bros., who took out over a half of a million of dollars in gold. They worked the ore in an arrastra, saving nothing hut the free gold, and not all of that. The sulphurets went to waste, and hy such waste thousands of dollars in gold went down the creek. The two-compartment shaft, which is 258 feet deep, has heen thoroughly retimhered from top to hottom. A test of the ore was made the other day, and it proved highly satisfactory. The hoisting works are completed, and the work of putting the engine and boiler in place is now going on; and as soon as the machinery is all in place, stoping will be commenced in the mine.

Nevada.

THE PENNSYLVANIA M. Co.—At the Pennsylvania mine ore is now heing extracted from the 700 level that averages $30 per ton. The French syndicate offer of $100,000 was declined.

CENTRAL DRIFT.—*Transcript:* The Central drift gravel mine, located near the Central House, has heen leased to Joseph Faull. The owners of this mine believe it to he on the same channel with the Harmony, near Nevada City.

FOUND THE LEDGE.—*Transcript:* The Pittshurg company has had men at work for the past two years hunting for the long-lost ledge in the south end of the mine, and this week they found it.

FOUND AN OLD TUNNEL.—The Red Dog Mining Company, of You Bet, in sluicing out Missouri canyon, cut the hed of slickens down and uncovered the mouth of the old Beyers tunnel, which was long ago closed hy the canyon being filled with slickens. The company now intend to reopen the old tunnel and extend it through their ground.

AT RAGON FLAT.—The Ragon mine, down at Ragon Flat, is getting richer every day. There is a strange mixture of gravel quartz in this claim, and hoth are rich.

Orange.

CEMENT MINE.—A new cement mine has heen unearthed in Orange county that gives promise of great wealth. The indications are that there are large quantities of it. The mine is located near El Toro; it is reported that Claus Spreckels is interested in the property.

Placer.

THE HASKILL OR GAYLORD.—*Argus:* It is the intention to commence operations at once, probahly at the point where the very rich gravel was struck.

THE MARGUERITE.—The final papers were drawn up this week hetween Jason Smith and Mr. G. Schmitt, representing the Marguerite, wherehy the former conveys to the Marguerite company the old Salsic claim. Superintendent Fred Deetken says the proposition is to crosscut on the 250-foot level of the Marguerite to the Salsic claim, going considerable over a hundred feet helow the Salsic shaft. The shaft of the Marguerite is now down 300 feet. They have two good prospecting ledges 2½ and 3 feet in thickness.

Shasta.

BOUGHT TWO MORE LOCOMOTIVES. — *Free Press:* The Iron Mountain Railway Company have purchased two more narrow guage locomotives, which are expected to arrive at Keswick this week. The grade on the line from Keswick to Iron Mountain is so heavy that it will require two engines to haul a train of any length up it.

THE SPANISH MINE.—H. Deakin is giving attention to the development of the Spanish mine near Shasta. He has a shaft down one hundred feet in ore that goes $9 to the ton. Eleven men are employed, and Mr. Deakin expects to get out a large quantity of ore for the smelter at Keswick.

AT KESWICK.—The first furnace now building at the Risdon Iron Works will he finished in six weeks. The present plant will accommodate an output of 600 tons daily, hut this will he increased until the yield will aggregate at least 1000 tons per day. Track layers are busy on all parts of the line, and the woods from Keswick to the mine are literally full of men. Fully 1300 men are employed on construction and development.

GENERAL NOTES.—*Democrat:* A rich body of ore was struck in the Niagara recently, in the O'Neal tunnel, and Superintendent Hanley states that the outlook is more encouraging than for years. They will start up soon with ahout forty men, and many increase the working force to 100.

Ten men were put to work on the Deakin & Taylor mines near Shasta, a few days ago. The old shaft used hy Jas. Sallee was pumped out this week, the old works are heing repaired, and preparations are heing made to develop this mine.

Paige, Carter and Fuller have heen at work on the Clear Creek Ditch tunnel, for over two months, preparing to hring water on the old Richardson gravel claim, which they have secured.

Livingston, Blaisdell, Cooney, Leivsay and Behrens who form the Big Four Mining Company, are sinking a shaft on the mine purchased from Emerson, Taylor and Johnson.

Chas. Jones has moved his mill from Muletown, to little Maud mine at Iron Mountain.

Siskiyou.

MINING NOTES.—*Journal:* Lamh & Franklin's quartz mill in Yreka will he started up again shortly, or as soon as sufficient quartz is hauled from the Williams & Wademan quartz ledge on north fork of Greenhorn. Work was suspended in the mine for a short time on account of the death of Williams from a cave in the tunnel, hut having heen well timhered since it is now heing worked with good success hy the surviving partner—Wademan—and a number of employes. This ledge pays from $30 to $50 per ton, with gradual improvement as the claim is developed.

The American Bar Co., at Ash creek, Klamath river, will soon be down to bedrock in the river, with expectation of finding richest pay, although the ground pays ahout $1.50 to the cubic yard from the surface down.

Espey, Hunter & Co. have stopped working their claim at Hawkinsville, and also shut down the pumping plant, in order to make a clean-up which will take several days, as much of the piping was conducted into ground sluices.

We hear that a San Francisco company has made au offer of $50,000 for the Espey, Hunter & Co. claim and pumping machinery at Hawkinsville.

The deal for the Schroeder mine on Deadwood, at $50,000, will probably he a go, notwithstanding the burning down of the mill and huildings lately, as the purchasers will want to put up a much larger mill.

Dietrick, the former Oak Bar mail carrier and now mining at Smith river, Del Norte county, says, in addition to finding cinnahar and silver ore in his claim, that he has also discovered a good quality of tin, and he thinks tin can he found in the Siskiyou mountains bordering on Del Norte county.

James W. Main of the American Bar mine, Klamath river, who was in Yreka last Sunday, showed us a peculiar nugget of gold which weighed $43. It was a flat piece in the form of bent metal, very different from the general style of nuggets found, heing ahout four inches long and one inch wide, and about as thick as window glass. It was of fine quality, as all gold taken from that claim sells at $18 an ounce.

A number of Seattle capitalists having purchased a lot of rich mining ground near Happy Camp, Klamath river, are now huilding a ditch of six and one-tenth miles in length from Thompson creek, to work the same hy hydraulic process. The ditch is to he four feet wide on the hottom and will carry a large body of water. This company will no doubt take out considerable gold dust when the claim is opened and developed, as all the ground in that section has paid rich.

A large body of quartz has heen found in the Black Bear claim at Salmon river, or is really a new ledge. It is ahout two feet or more wide and as far as opened extends a distance of over eighty feet. All the quartz taken out pays from $20 to $25 per ton, and there seems to he no douht ahout this ledge proving as extensive as the original Black Bear lode.

Tuolumne.

NEW LIFE IN TUOLUMNE.—There is a rush of travel to the rich mining regions of Tuolumne county, and the old line and opposition stages have cut the fare to $2 each way. The fare from Milton to Sonora, Columhia or Jamestown, is now $2, and the stages go out loaded to the limit every day.

The old town of Jamestown is now a thriving little city, and where there were only ahout twenty residents in the place two years ago, there are now hundreds, and buildings are being rushed to completion to house the newcomers for the winter. The old Bella Union hotel of early days has heen almost deserted for many years and has not heen used as a hotel for a quarter of a century until recently. Now it is open for travel and two other hotels are heing erected to accommodate the new husiness. In addition to the other structures in course of erection is a foundry and machine shop, which is owned hy Demarest & Fullen of Angels.

In the new town of Stent, near the Quartz Mountain mines, ahout two and a half miles from Jamestown, husiness is heing done with a rush, and money is plentiful.

The Angels' *Voice* says Geo. W. McNear, the capitalist and wheat huyer, is preparing to estahlish an electric lighting and power plant on the Stanislaus river, three miles below Bostwick's har within four miles of Rawhide. The idea is to furnish ahout 2000 horse power, the amount of water located heing 40,000 miner's inches, or ahout 800 cubic feet a second. H. L. Smith, of Oakland, formerly engineer in charge of the construction of the Market street railway, in San Francisco, will have charge of the engineering, and it is expected that surveys will immediately he made.

NEVADA.

ON THE COMSTOCK.—The bullion statement of the Chollar for October is: Worked at Nevada mill, seventy-five tons of ore; gross proceeds in hullion, $1969.94; cost of reducing, $450; net proceeds in bullion, $1519.94; assay value per ton, $33.29; gross average per ton, $26.26; net average per ton, $20.26, mill worked 78.9 per cent.

The bullion statement of the Potosi for Octoher is: Worked at Nevada mill, 1100 tons of ore; gross proceeds in hullion, $24,877.55; cost of reducing, $6600; net proceeds in hullion, $18,277.55; assay value per seventy-five tons, $33.29; assay value per ton, 1025 tons, $28.32; gross average per ton, $22.61; net average per ton, $16.61; mill worked 78.9 per cent.

Pending repairs to the main shaft of the Yellow Jacket all work in that mine and in the Kentucky Con. has heen suspended.

In the Savage, on the 950-foot level west crosscut No. 1, started from the north lateral drift, was advanced a total distance of 190 feet, when it reached the west wall of the ledge and was discontinued. At a point 35 feet hack from the face of this drift they have started a north drift to prospect the body of quartz discovered hy the west crosscut. In the west crosscut from the face of the north drift they have upraised from the fourth floor to the eighth floor and connected with the north drift therefrom; this connection affords good ventilation. The north drift from the eighth floor of north upraise is advanced 70 feet; face is in quartz giving fair assays. During the week they have hoisted 63 cars of ore from the 950 and 1050 foot levels; car samples average $26 per ton. Shipped to the Nevada mill 72½ tons of ore and milled 207½ tons; battery samples average $25.51 per ton. Shipped to Selby's Smelting & Lead Company 528 pounds of crude hullion, the result of 577½ tons of ore worked at the Nevada mill.

SADORUS MINES.—*Silver State:* Since April 1st hetween six and seven thousand dollars worth of gold dust has heen taken from the Sadorus placer mines.

WILL BUILD A MILL.—*Tribune:* Tired with the enormous expense attached to the shipping of their ores from De Lamar, Nev., to Salt Lake, the April Fool owners have decided to put up a mill for the treatment of their ores. Frank Wilson, the principal owner of the mine says the proposed capacity of the mill is ten stamps, with a cyanide plant equal to the crushing capacity.

SHIPPING ANTIMONY.—The *Central Nevadan* says ahout sixty-four tons of antimony came over the N. C. last Saturday, coming from Pradier Bro.'s mine at Big Creek, Lander county. It was shipped to San Francisco.

A HOPEFUL FEELING.—The White Pine *News* says a fine development of carhonate silver-lead ore has been made hy Henry Steady in the Ne Plus Ultra mine in Swansea canyon. There has heen quite a hopeful feeling generally prevailing in Hamilton, that the old town that witnessed during 1868-'69-'70, the liveliest times ever seen in Eastern Nevada, if not on the coast, will again forge to the front.

THE PINE NUT SALE. — The *Tribune* says Raycraft, Livingston, Russak and Deal, representatives of an Eastern syndicate, returned to Carson from an inspection of the Zirn-Schultz mine in Pine Nut, say that Pine Nut is assuming the dignity of an old-time mining camp. It is an assured fact that the sale of the mine, with its extensions, will shortly he made to the Eastern syndicate; the parties who last visited the mine confirmed the report suhmitted hy expert Eldridge.

A NEW CORPORATION.—The Virginia City *Enterprise* reports articles of incorporation filed in Carson of the La Grange Ore Consolidated Hydraulic Mining Company; capital $5,000,000: Directors, A. Livingston, W. F. Brann, A. Cohn, M. Cohn and H. K. Brown, all of Carson. The company has control of the King Bros. claims and the Ninety-four mine, in Gold Canyon. King Bros.' property is honded for $35,000.

LYON COUNTY.

The Lyon County *Times* says with a whole lot of good placer mining ground honded, and Silver City and Como giving indications of being extensive gold producers, that section of the country may reasonably expect a moderate hoom next spring.

OREGON.

THE BONANZA MINE.—The Bonanza mine on the 8th sent in a clean-up amounting to $4500, the result of a two weeks' run. The ledge, at a depth of 350 feet, is twenty-two feet wide. A 1400-foot tunnel is heing run to tap the vein at the depth of 800 feet, and the capacity will he increased from ten to twenty stamps.

IDAHO.

CŒUR D'ALENE MINES. — The Standard mine is now working eighty-five men. The Poorman and Tiger are working a small force. The Frisco has seventy-five men employed but the Gem is shut down for lack of water to run the mill. In Wardner the Bunker Hill and Sullivan, the Last Chance, the Stemwinder and the Sierra Nevada are taking out ore. The Hunter mine at Mullan has also resumed operations.

IN THE CŒUR D'ALENES.—The Bunker Hill and Sullivan mine was closed down for two days last week to make some repairs to the tramway.

Ahout a dozen men are now employed ou the Sierra Nevada mine, doing development work.

Ahout eighty men are employed on the Frisco mine. The concentrator is running the day shift only.

The lessees of the Stemwinder have the mill and tramway in operation. Only a small number of men are employed.

BRITISH COLUMBIA.

THE CARIBOO MINE.—The Cariboo mine on the South Fork of Quesnelle river, comprises a hank of gravel two miles long on the river side, a canal eighteen milcs long, discharging water through two nine-inch nozzels. Twenty-nine days in August of ahout fourteen hours each turned out $41,875.65.

BLUEBELL AND PILOT BAY SMELTER.—A. B. Hendryx, general manager Kootenay Mining and Smelting Co., owners of the Bluebell mine and the Pilot Bay smelter, says: "The compressor and drills at the mine will be ready for operation in about 20 days. It is the intention to keep one of the drills continuously at work on the vein of copper on the lower level. There is another vein of copper-hearing ore in the mine which carries one ounce of silver to each per cent of copper. At the smelter the work is going on much as usual. We are using ore from the Skyline and Number One mine at Ainsworth."

TERMS OF SALE.—The terms of the sale of the Winnipeg in the Wellington group, Boundary Creek district, hy D. McIntosh to J. R. Toole, representing Marcus Daly, are given hy the *Minina Advance* as follows: One thousand dollars down; $4000 as soon as the crown grant is ohtained, which will he as soon as the claim is surveyed and it can be issued, and $55,000 hefore the 15th of July next. Between the present and the 15th of July the purchasers are given permission to carry on development work at their own expense, the proceeds of the ore shipped, if any, to revert to the original owner.

UTAH.

NEILL'S FURNACE TESTS. — *Tribune:* The initial furnaces of the Neill process of fire concentration, the design of James W. Neill of this city, that have heen put up at Bingham to work on the sulphuretted ores of the Utah mine, are now working full hlast and successfully. Ahout forty tons of pyrites of iron are heing roasted daily in each furnace. Mr. Neill's application, provides for a system of blast and a specially designed grate through which the oxygen is forced to mix with the flame of the sulphur in the ores that are thrown on the top of the grate. The fact that one furnace with one man in charge can successfully desulphurize forty tons of ore per day, and without fuel, shows the advance that has been made in pyritic furnaces since the time when a roaster meant a stack of cord-wood, in the interstices of which the ore was placed.

NEW COMPANY.—The Searchlight Gold Mining and Milling Company has incorporated to operate near the Sunshine in Camp Floyd district; capital stock, $1,500,000; incorporators, J. Barnett, S. Spiro, J. Oherndorfer.

COLORADO.

BIMETALLIC SMELTER AT LEADVILLE.—*Herald-Democrat:* The Bimetallic smelter is one of the most interesting of the various plants which are now being operated in this city. It is interesting especially to the smelting man, on account of the unique methods employed in the treatment of ore, although to the layman there is practically no difference in the process. The product of the Bimetallic, however, is a matte, containing the gold and silver combined with iron or copper.

The miners in the Little Johnny have received a raise of wages from $2.50 to $3 per day. Manager Campion says the raise was made to keep good miners at work there.

LOWER CALIFORNIA.

STARTED UP.—The new fifty-stamp mill at Calmalli, has begun operations. Don Emiliano Iharra, late owner of the Calmalli is interested in the Jacolitos district, and has sent five wagonloads of supplies there from San Diego.

MEXICO.

AT MINAS PRIETAS.—The new roasters at Minas Prietas, are in operation. The two have each a daily capacity of fifty tons tailings from the Minas Prietas mill. The wire rope tramway, 700 feet long, carries the tailings from the dump to the drying floor of the roasters, and after undergoing treatment the tailings are again run through the mill, saving the gold which was not taken up in the first handling hy the mill, which was of such value that the new operation is profitahle.

Obituary.

A DEPLORABLE ACCIDENT occurred at the Maryland mine at Grass Valley, Cal., last Saturday morning, hy which Victor L. Dorsey, son of Supt. S. P. Dorsey, lost his life. He had gone to the hottom of the shaft between the 1600 and 1700-foot levels, where a part of the hanging wall fell upon and crushed him. Death ensued in two hours. Deceased was 28 years of age, a clever electrician and of unusual mechanical ability.

THERE died at Pasadena, Cal., this week a Pacific coast pioneer whose career illustrates how wealth can he made hy men who see and utilize opportunities. Reference is made to Simeon G. Reed, who in 1859, with William S. Ladd, R. R. Thompson and J. C. Ainsworth organized the Oregon Steam Navigation Company, which for twenty years controlled communication hetween western Oregon and eastern Oregon, eastern Washington and Idaho. The company practically owned the Columbia river, and all passengers, all freight paid toll to it. They huilt steamers to ply on the Columbia, Willamette and Snake rivers, and a portage railroad at the Cascades. All the gold taken out of Idaho was carried hy these steamers. The company was organized with $200,000 capital, divided $4,000,000 of profits, and in 1880 sold out to Henry Villard for $5,000,000. who organized the Oregon Railway and Navigation Co. and disposed of it for $14,000,000. In 1888 Mr. Reed and others hought the Bunker Hill and Sullivan mine at Wardner, Idaho.

A Practical Suggestion.

TO THE EDITOR:—It will be a great misfortune to the mining intcrests of Califor should the Land Office continue to iss patents to the mineral lands claimed hy the railroad as agricultural, and concerted action to prevent this is necessary.

The best protection to the miners and to the

Goverament is to havo all agricultural lands granted to the railroad appraised by a competent commission, to he created by an act of Congress, and their valuo to ho credited on the railroad's indohtedness.

This seems to ho the best and only true solution of this great question, and it will protect tho Government, protect the miner, und reduce the road's indehtedness to the extent of value of the land, and solve tho problem in an equitahle manaer.

I hopo this method of adjusting tho question may meet with your fall approval and that of the daily press, and of all who have the mining interest sincerely at heurt.

GEO. JOHNSTON.

San Francisco, Nov. 14th, 1895.

Personal.

G. V. GRAY has returned from Mexico.

FRED'K KEFFER is located in Tucson, Arizona.

GEO. R. PINNEY has gono to Boston to float the Rawhide stock.

F. A. HALL is now assayer for the Monte Cristo, Wash., Mining Co.

J. B. HAGGIN, who was last week reported seriously ill, is convalesceut.

J. B. MAGRUDER is superintending the new roasters at Minas Prietus, Mexico.

R. H. TERHUNE is now generul manager of tho Rico, Colorado, reduction works.

CHAS. M. DUNLOP goes to the Lucky Boy mine, Custer, Idaho, as chief ongineer.

E. C. WRIGHT, general auditor of the Southern Pacifie Co., has returned from Japan.

LIEUT. C. E. GILLETTE, of the U. S. Debris Commission has returned from Sierra Co.

GEO. MAINHART started the machinery at the Bullion mine, Grass Valley, this week.

HERBERT VISCHER of tbe Debris Commission is on a tour of inspection in Plumas county.

J. C. CAMPBELL will have charge of operations at the Old Flag mine, Bear's Valley.

W. R. RUST, manager of the Tacoma Smelting and Refining Co., reports continued success.

G. A. INGERSOLL is erecting a custom mill at Tyson's Wells, Yuma Co., Arizona, for Plomosa district.

SEC'Y SONNTAG of the State Miaers' Association has returaed from a business trip to Nevada Co.

JOHN EDDIE has heen re-elected superintendent of the Peansylvaaia Miniag Co., Grass Valley.

ALBERT VESTAL of Red Bluff succeeds Wm. Fowler as superinteadent of the Trinity Consolidated mine.

C. L. MILLER is supervisiag the huilding of the dam at the Manzanita mine hy the Milton Co., at Sweetland.

JNO. H. TALBOT of Denver, Colo., has heen appointed general manager of the Helen Miaiag Co., Graham, N. M.

J. B. ELDRENGE is back from Chicago, where he has heen successfully negotiatiag the sale of mining properties in Nevada.

A. A. ABBOTT is visitiug his home in Sacramento. He has been opening up the old Santa Rosalia mine, Arizpe, Sonora, Mexico.

ALFRED L. TUBBS has been elected a director of the Sonthern Pacific to fill the vacancy caused by the recent death of A. N. Towne.

MAJOR W. H. HEUER, of the Debris Commission, has returned from a visit to the Omega Co.'s dam, which he praises very highly.

R. HAMILTON has resigned the superintendency of the copper smelter at Tucson, Arizona, and goes to Australia. Jno. Francis is his successor.

J. E. DOOLITTLE is superintendent of the new operations at the Alta mine, which is heing developed hy a tunnel directly under the town of Alta.

J. T. GRIBBLE of Nevada City, superintendent of the Reward mine, has heen appointed to take charge of the Merrimac mine, near Glenbrook Park.

G. W. PRESCOTT has resigned as superintendent of machinery and car departments of the Southern California railway, of the Atchison, Topeka & Santa Fe system.

CHAS. E. BENT, formerly superintendent Bunker Hill and Sullivan, Idaho, mines, is now superintendent for the Mexican Mining and Development Co., Altar, Sonora, Mexico.

THE position of foreman of the Monte Cristo Mining Company, vacated hy E. Goodwin, appointed professor of geology of the State School of Mines at Moscow, Idaho, is now filled hy William Stevens.

DR. A. SCHIEDEL, whose recent monograph on the cyanide process has attracted so much attention, sailed for West Australia on the Mariposa last Thursday, whither he goes to investigate some Westralian mining properties.

BENJ. TIBBEY, superintendent of the Parrott mine, at Butte, Montana, recently refused an offer of $12,000 a year to take charge of some mining operations in Japan. He has heen with the Parrott fifteen years and is too proud of it to go anywhere else.

JOSEPH ARON, a former San Francisco resident, is now conducting a mining journal—*La Mine d'Or*—in Paris, France, and has lately heen pricking the Kaffir huhhle in the French capital. His crusade against the Barnato stocks has had considerahle recent effect.

R. H. CAMPBELL of Siskiyou has returned from a visit to the Horsefly Hydraulic G. M. Co.'s property at Quesnelle Forks, Carihoo, B. C., and is enthusiastic as to the possihilities of a hydraulic elevator there. He says he will put in two elevators there, a main and auxiliary. He will return there next April.

Books Received.

"Contribution No. 4 from the Lick Observatory: Report on the Total Eclipse of the Sun, Observed at Mina Bronces, Chile, on April 16, 1893," by J. M. Schaeberle, Astronomer. The 128 pp. of the book from the State Printing Office give a good account of that astronomical event hy the gentleman who first made the history thut he has written. The necessary fuads being supplied, Prof. Schaeberlo selected a point in the desert of Atacamu, Chile, from which to observe tho solar eclipse of April, '93, and with all requisite appliauces made the journey, wus successful in all his observations, and was ahle to muko several important additions to seience, all of which, together with a most interesting description of his journey, his computations, deductions therefrom, etc., are given, with severul illustrations. The technical description, especially of tho corona, is most interesting, its structuro, formation, and cause hoing given elaborate discussion.

Prof. Schaeberle says:

"With our present knowledgo of the condition of spaco extorior to the earth, all deductions reluting to the electrical conditions in this spaco must he considered to he of u purely speculative character. Wo have no direct evidence that the sun is an electrified body. We have direct evidence that tho sun is continually ejecting enormous quantities of material particles of matter with very great velocity."

Further on, he says:

"My own investigations seem to show that, so far as the eclipse of April, 1893, is concerned, there is no evidence to indicate that either electricity or magnetism has anything to do with the arrangement of coronal matter in the sun's neighhorhood."

With tbe modesty characteristic of true scientists, Prof. Schaeberle refers hut briefly to his own part in the journey or its success, ascribing the credit to his assistants, hut it is manifest that the scientific world owes the information resultant from the Mina Bronces expedition largely to the intelligeace and zeal of the gentleman who brought the entire matter to a successful conclusioa.

"Journal of the Franklin Institute for November." Valuable monographs are "Tests of Cement Mortar Mixed with Various Kinds of Sand," "What Is Bitumea?" and "On tho Technical Analysis of Asphalts," the latter hy S. P. Sadtler, Ph. D.

"Economic Mining: A Practical Handbook for the Miner, the Metallurgist and the Merchant," C. G. Warnford Lock, pp. 668. The author declares his desire to produce a hook that would he of more practical importance than scientific value. His idea, more fairly stated, appears to be to give facts of importance to the mining world as a husiness proposition, apart from any abstract discussion of underlying facts. In this he has heen successful, in compiling a work that is of considerahle practical value. Its scope is comprehensive, including prospecting, power, drilling, blasting, shaft siukiag, ventilation, lighting, draining, hauling, hoisting, reducing, concentrating, etc. The cheapest aad hest way to put metalliferous and non-metalliferous minerals in commercial form is given extensive discussion, and many recent publications of facts relative thereto have been laid under contribution. The work is written from an English standpoint, applies largely to English mines and methods, and has a foreign flavor that tends to detract from its local value. It is published hy E. & F. N. Spon, 125 Strand, London, and Spon & Chamberlain, 12 Cortlandt St., New York, and is fully up to the typographical excellence of that house's publications. The price of the hook is $5.

"Modern Copper Smelting," by Edward Dyer Peters Jr., Seventh Edition. The first edition of this work, which appeared in 1887, commanded wide sale, and the present prominence of the copper industry justifies the author in practically rewriting the hook. This volume of 642 pages contains nearly all that is at present known ahout copper and the hest way of working copper ore, and on the principle that everyhody is wiser than anybody, the author has not hesitated to utilize valuahle information on that subject wherever procurahle. A two-page article which appeared in this paper on Jan. 12th, 1895, entitled "Improvements in Matte Smelting," hy Herhert Lang, extracts from other mining journals, Nicholl and James' paper on "Direct Refining," R. Sticht on "Pyritic Smelting," W. L. Austin, and other authorities have heen cited on the suhject, the compiler giving partial credit for what he thus used. Besides all this, Prof. Peters has made valuahle contribution to applied science in his very full discussion and description of modern methods, and gives many poiats of procedure ordinarily considered "trade secrets." The commercial importance of the red metal and the recent radical changes in copper smelting justify the timely appearance of this volume, which is of great metallurgical importance in the field of which it treats. It is issued hy the Scientific Publishing Co., 253 Broadway, N. Y.; price $5.

"Lead and Zinc Mining in Missouri and Kansas," with Map; a 55-page pamphlet hy John R. Holihaugh, of interest to the section discussed. Scientific Publishing Co., N. Y.; price 50 cts.

"The Production of Iron Ore in Various Parts of the World," by Jno. Birkinbine, pp. 204; an elahorate monograph on a subject of world-wide interest from competent authority; puhlished by the U. S. Geological Survey, Washington, D. C. The statistics are complete and up to date, the descriptions of mining and smelting processes are from the hest sources, and the accompanying tables and illustrations are of the superior nature characterlstic of United States Government publications.

Coast Industrial Notes.

—On June 30, 1894, there was in California 4861 miles of railway.

—Modesto men figure that in that section of the State it costs 80 cents per centul to raise wheat.

—Fiual survoys are being mado on tho Yosemite Valley railroad, from Merced to the Yosemite Valley.

—The South Yuba Water Company has a franchise to erect olectric light poles, etc., in Sacramento couaty.

—The South Yuba Water Co. will complete their liuo of poles and wires from Newcastle to Sacramento by Dec. 1st.

—The Seattle, Wash., Power Company announces intontion to spend $3,000,000 in u water and power plant thore from Cedar river by wny of Swun lake.

—Nearly 500 employos of the California Sugar Refiuery at the Potrero will he idle till Feh. 1st, '96, whon the repairs to the iustitution will ho completed.

—The transportation committee on securing the Republican National Convention for San Francisco, havo tho assurance of a $50 round-trip railroad rate between hero and Chicago.

—The Hudson Reservoir Co. on Salt river, sixty miles from Phoenix, Ariz., has been reorganized in New York. H. C. Manu is the new president. Work begius this month on the dam.

—Railway time from New York to San Francisco has been reduced to four days on the regular daily service on the lines coming into this city. From Chicago the time is three days.

—The forthcoming report of the Engineer Commission, which visited Nicarugua last summer, will recommend the huilding of the Nicaragua Canal hy the United States. The cost in estimated at $100,000,000.

—The Pacific Coast Oil Co.'s new tank oil steamer, the Geo. Loomis, was launched at the Union Irou Works last Saturday. It will carry 6000 barrels of oil each trip from Ventura and will use the petroleum for fuel.

—John Rosenfeld is credited with beiug at the head of a San Francisco syndicate to huy and develop 5000 acres of coal land iu tbe vicinity of the coal mines of the Alameda and San Joaquin R. R. Co. A railroad thence to Oaklaud is a part of the outlined scheme.

—A $150,000 cokiug plant is to he erected at Anthracite, on the Canadian Pacific Railroad, east of Banff, for the purpose of using the Canmore coal. This is an anthracite product, and is said to he the only true anthracite coal ia the Northwest. The mines were discovered fifteen years ago.

—The State fruit growers report an output from 1890 to 1895 as follows: Fresh deciduous fruits (shipped), 621,491,500 pounds; fresh citrus fruits (shipped), 521,047,400 pounds; cured fruits (produced), 400,600,000 pounds; raisins (produced), 335,000,000 pounds; canned fruits (produced), 427,159,500 pounds. Total pounds, 2,308,298,400.

—From January 1st to Octoher 1st, '95, specie exports from San Fraacisco aggregated $20,588,800; during the same time last year there was exported $24,010,000. Of this year's exports $14,540,061 went to China and Japan aad $5,405,565 to New York. Among the items were, Mexican dollars, 7,777,000; silver hullion, $6,923,000; gold coin, $4,306,000.

—The Pacific cahle scheme, advocated by several of the Rritish colonies and the Dominion of Canada, was discussed at a meeting of representatives of Canada, Australia, New Zealand and the South African colonies, at London, Octoher 29. The new instructious sent hy the colonies to their ageuts general show that the colonies are for the most part willing to bear their share of the expense, and are anxious that the matter should he pushed actively.

—The operators of the Siherian Railroad, now in course of construction from the Black sea across to Vladivostock, havo placed a large order for locomotives. The Siherian Railroad when completed will he one of the longest in existence; its tracks will extend across 7,500 miles of territory. The completion of that road will render possihle, at a comparatively small expense, the shipment of materials and products from the Pacific to the Black sea districts.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Niedecker & Alderson, in the Bobby Burns Mine, near Placerville, El Dorado Co., to impound tailings in a ravine below the mine; from Martin Bros., in the Martin Mine, near Placerville, El Dorado Co., to impound tailings in a ravine below the mine; from Eugene Piaggi, in the Blacklock Mine, near Placerville, El Dorado Co., to impound tailings in a dry ravine; from H. E. Picket, in the Tiedman Mine, near Georgetown, El Dorado Co., to impound tailings in Marshall Canyon; from Geo. W. Davey, in the Sailor Creek Mine, near Garden Valley, El Dorado Co., to impound tailings in Irish Creek; from Mrs. Bertha Sutton, in the Jackson Creek Mine, near Cronuberg, Plumas Co., to impound tailings in old pits; from Simcoe Chapman, in the Dutch Mine, La Porte, Plumas Co., to impound tailings in Rabbit Creek; from Fred Lewis, in the Lewis Mine, on Rich Gulch, Plumas Co., to impound tailings in Rich Gulch; from Fred Scott, in the Arctic Mine, near Butte Valley, Plumas Co., to impound tailings in Marian Creek; from Chas. Y. Hepler, in the Miocene Mine, near Crescent Mills, Plumas Co., to impound tailings in Sneider Gulch; from Ed. Bryan et. al., in the Chaparral Hill Mine, near Saw Mill Flat, Plumas Co., to impound tailings in a dry ravine; from the Plumas Blue Gravel Mining Co., in its mine near Nelson Point, Plumas Co., to impound tailings in an old pit and on flat-ground; from J. B. Higgins, in the Michigan Hill Mine, near Quincy, Plumas Co., to impound tailings in old pits and on flat ground; from Daniel Conlan, in the Pacific Mine, near St. Louis, Sierra Co., to impound tailings in an old pit; from J. M. McClung, in the Ram Creek Mine, near Brush Creek, Butte Co., to impound tailings in Ram Creek; from George Reese, in the Reese mine, near Redding, Shasta Co., to impound tailings below the mine; and from the Eureka Lake & Yuba Canal Co., in the Farrel Mine, Columbia Hill, Nevada Co., to impound tailings in worked-out pit—gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Nov. 18, 1895, at 1:30 P. M.

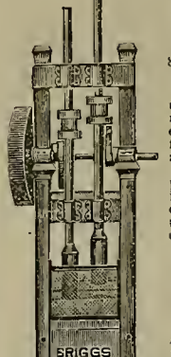
CALIFORNIA STUMP PULLER.

This is a photograph of the Stump Puller at work on redwood stumps on the farm of C. E. Ogburn, Guerneville, California.



In the improved form in which it is now offered to the public, it is universally admitted to be the most practical, powerful and successful machine of the kind in America, and the only machine in existence that can be successfully operated on hill land.

Send for catalogue to

A. BARNES, Manager,
82 and 84 Zoe Street, San Francisco, Cal.

The Briggs

TWO-STAMP MILL,

850-lb. stamps; weighi of mill, 6000 lbs.

The most substantial mill ever offered to miners; discharges both ends and front; will crush from 6 to 10 tons per day; any one can set it up.

Complete as per cut, price $450.00. This mill is furnished with 9-inch cast steel shoes and dies and substantial indepen. dent iron guides.

WANTED!

A THOROUGHLY PRACTICAL MINER AND ASSAYER desires an opportunity to develop a new property, partly on salary and partly on shares. Will go to any country. Has occupied several positions of trust as foreman and assistant manager of mines. RENO Box A, this office.

WANTED.—POSITION IN A QUARTZ Mill by a young man, as engineer or battery man can run concentrators and dynamos, and give references. F. W. L., Box A., this office.

INVENTORS, Take Notice!

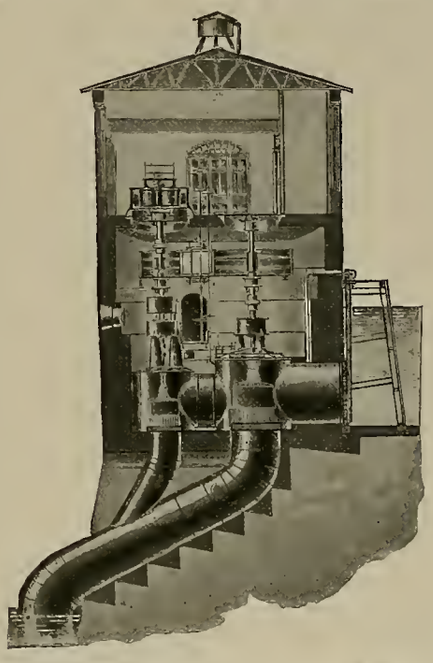
L. PETERSON, MODEL MAKER,

226 MARKET ST., N. E. Corner Front (Up Stairs), SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

Electrical Progress.

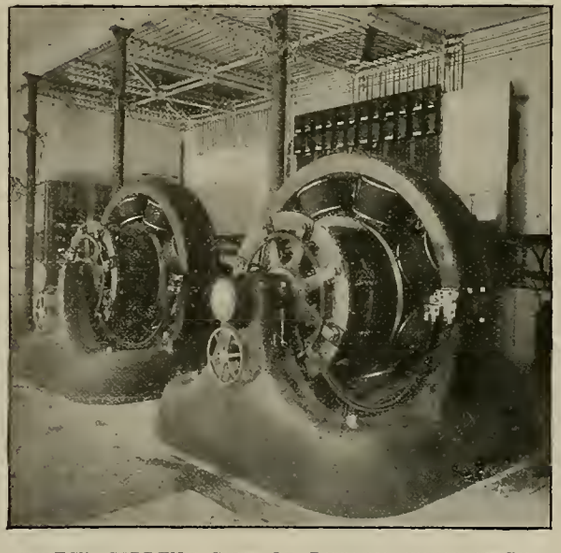
The Portland, Oregon, Power Transmission Plant.

(*Continued from page 317.*)



From the generators the current passes directly to the line through the switchboard. The line is 14.3 miles long, a separate circuit being installed for each machine. It passes through an undulating country following the course of the Willamette river as closely as possible. The poles upon which the three-phase wires are strung also carry a number of wires for the 5000-volt continuous arc current from the old transmission station, as well as the wires over which the old system of lighting with high frequency 5000-volt alternating current is effected. The loss in the long-distance transmission line is calculated at full load at about 17½ per cent.

The sub-station to which the high frequency lines are brought is a two-story building at the corner of Seventh and Alder streets, covering a space of 40x100 feet. The lower floor is divided into three rooms, one containing the transformers, the second the rotary converters, the other being used for a repair shop, lamp and meter room. The upper story of the building is occupied by the offices.



In the transformation room at present are the necessary transformers for the three units already installed—forty-five transformers in all. The receiving end of each line is connected to a bank of fifteen transformers per generator, five being placed between each pair of wires of the three-phase system. The transformers are mounted on an iron rack five transformers high and three wide, and foundations are already laid for six additional units. Each set of five transformers is connected to the primaries in series and to the secondaries in parallel, although in the transformation of the three-phase current only two sets are necessary. For the large units, with high voltages, however, as employed in the present installation, it is desirable to have a large number of transformers banked. The bank, therefore, is divided into three sets instead of two, so that each group may act as a reserve to the other two sides, enabling two-thirds of the power of each generator to be delivered even if the transformers on one leg of the circuit have to be disconnected; nor is the balance of the system effected by this change of connection. The transformers regulate at a little over one per cent variation of the secondaries from no load to a full load. The transformers are of the standard General Electric sub-station type, having numerous air passages between successive bunches of iron lamina and between the coils, so that they may be cooled by artificial ventilation. This enables the transformers to be worked at a high output of efficiency and yet remain cool. The distribution of light from the secondaries is effected on the Edison four-wire system, which allows of a large territory being operated from one transformer station, and which also allows of the working of synchronous and induction motors from the lighting mains. The four-wire system is worked at 133 volts between any two wires and by means of feeder regulators a variation of 7½ per cent in either direction is covered.

The direct current for the railway service is obtained by conversion from the three-phase alternating current. This is effected by means of rotary transformers, a type of machine which the General Electric Company has brought to a high state of perfection. Two of these are at present installed in the sub-station, and space has been left for an additional three. The capacity of each converter is 536 horse-power, delivered to the bus bars of the continuous current switchboard.

The long distance transmission lines for this railway service, as in the case of the lighting circuits, are connected to step-down transformers, transforming the current from 6000 volts on the line to 400 volts at the secondaries. The secondaries are connected to the three collector rings on one side, and the current is thus brought into the armature of the rotary converter. The alternating current at 400 volts is then converted in this machine into direct current at 500 volts at no load and 550 volts at full load, delivered from the commutator side. The rotary converters are arranged for self-regulation, the voltage on the direct current side compounding with the same regularity as that found in the best direct current dynamos, despite the varying losses on the long distance line and the varying armature reaction in the rotary converter. This regulation is entirely independent of the generator, which receives constant excitation at all loads. The shaft of the rotary converter is extended twelve inches beyond the bearing of the alternating current side to take a small pulley from which any small machine or an arc dynamo may be driven.

SECTION THROUGH STATION TRANSMISSION.

DIRECT CURRENT SIDE OF ROTARY CONVERTERS.

It is a noteworthy fact that, in spite of the long transmission line and the increasing load of the generator, the potential supplied to the railway lines steadily rises as the load is increased.

Each rotary converter has a capacity of 400 K.W. It is an eight-pole machine, making 500 revolutions. The armature is ironclad, carrying at one side a commutator and at the other three collector rings.

From the rotary converters the wires are taken to the power switchboards. Each converter has two panels—one for the three-phase current and one for the continuous current. The alternating current panel carries two double-pole switches—one for connection to the converters and transformers and the other to connect the converter to a set of common bus bars. An additional main switch is provided to connect the rotary transformer and the panel itself which carries also a set of fuses, three current indicators and a potential indicator with a transformer reducing the potential from 3½ to 1. The continuous current panel is of the standard direct current railway type with automatic circuit breaker and a current indicator added for the fields of the rotary transformer. The panels may be coupled in parallel on both the alternating and continuous current side.

The lighting switchboards in the sub-station consist of one panel for each leg of the three-phase system. The secondaries from the transformers are entirely independent and the panels carry fuses and two four-pole switches for coupling the feeders directly either to the corresponding transformer unit or to the bus bars and the switches for the operation of the feeder regulators. A current indicator is placed on each side of the four wires and three potential indicators between the four wires. On top of the switchboards are placed the main switches for opening the different feeders, and each panel is provided with ground detectors and lightning arresters.

At present the lighting from the three-phase system is used for large buildings, containing several hundred lights each. They are close to the city station and this distribution can be readily handled at about 400 volts. For the outlying and residential districts the high frequency apparatus with individual transformers will still be employed. Continuous current will be furnished to the railway and to the stationary motors already installed, but new motor installations will be made with the three-phase motors, which will be run straight from the three-phase switchboard in parallel with the rotary transformer.

The direct railway current will be carried to the East Side railway station by means of cables under the Willamette river, and this distribution will reach as far as Milwaukee, where connection will be made in parallel with the 600-volt service from either Station A or Station B at Oregon City. The loop from Oregon City to Portland and back will thus be as follows: Beginning at Oregon City with thirty-three cycle three-phase current at 6000 volts, 14.3 miles will be traversed as far as Portland; the current will then be transformed to 400 volts alternating and passing through a rotary converter, issue therefrom at 600 volts continuous, which will be transmitted eight miles to Milwaukee and connect with the continuous current from Oregon City.

This plant, when finished, will be one of the largest long-distance transmission plants in the world. Its satisfactory operation so far shows admirably not only the effectiveness of the three-phase transmission system for general service, but also its feasibility. This has rendered possible its adaptation to the operation of important railway systems through simple apparatus and to the working of a distributing network composed in a large part of existing lines.

Scientific Progress.

Apyrite.

Under the name of apyrite Herren Schiffer and Kircher of Grunstadt, in Rhenish Bavaria, work a mineral containing about 93 per cent of silica, and consequently very refractory. When mixed with water it forms a plastic and adhesive mass which, after dessiccation, becomes firm and resisting, while its volume does not change when exposed to the fire. Moreover, it is scarcely attacked by metals and scoria in fusion, which either do not stick to the surfaces made with it or are easily removed without the least detriment to the furnace. In the neighborhood of the mines apyrite, tempered with water, is used instead of lime mortar, and also for plastering. Slightly damped, this substance is punned so as to supersede firebrick lining, as in the case of various furnaces; and a large foundry cupola can thus be lined in a day by two men, while such a lining lasts longer than one of the same substance made up into bricks. For repairs to the firework liuing of furnaces apyrite is also very useful, while its low price, and the fact that it is a good non-conductor of heat, recommend it in the case of blast furnaces, puddling and heating furnaces, foundry cupolas and crucible furnaces.

Electrical Vibration on the Ear.

Whatever may be the outcome of the investigations now being made by New York and other aurists, on the effect of mechanical and electrical vibration in curing deafness and various diseases of the ear, it is certain that ordinary telephone conversation is heard much better by some people than by others, even where there is no manifest superiorty of the organs of hearing. An electrical journal illustrates the peculiarity amusingly by relating the experience of the salesman of an electrical supply house in an Iudiana town. The salesman was showing a pair of improved telephones, which had been installed for exhibition purposes, and a number of citizens present were pleased and surprised at the loud talking of

the instruments. One of the citizens had been almost deaf for many years, and more as a joke than with any idea of a test the others shouted into his car the suggestion that he should try the telephone. As the man put the receiver to his ear his face assumed an expression of mingled astonishment and delight. He could carry on a conversation with the person at the other end of the line without any apparent difficulty. Overflowing with gratitude, he promptly treated the crowd, and he entertained the salesman royally for the rest of his stay in town.

Relations of the Eye and Brain in Sight.

It is sometimes cited as a remarkable circumstance that we see things right side up, although the image thrown on the retina is upside down. Professor Brooks seems to share this popular opinion, for he writes recently in *Science:* "We all believe many things which are inconceivable, such as the truth that the image in our eyes is upside down." In the next number of the same journal (October 11th) a correspondent signing himself "J. McK. C." (probably Prof. J. McKeen Cattell) comments on this statement as follows: "But why is this inconceivable? To those having knowledge of elementary physics it is inconceivable that the image should not be inverted. Perhaps Prof. Brooks means that it is incomprehensible that we should see things right side up when the image is upside down. This is sometimes urged, but would seem to be sufficiently answered by a remark once made by Lotze in the presence of the writer: 'If any one is troubled by the fact that the image is inverted, let him suppose that the soul stands on its head.' It is, indeed, quite as reasonable to suppose that the mind stands on its head as to suppose that it stands on its feet and looks at the image on the retina, which would seem to be the assumption to those who are troubled by the phenomenon. A similar paradox is the fact that with two images on the retinas we see things singly. This may also be treated without undue seriousness by the question: 'If we hear a baby crying with two ears, why do we not think it is twins?'"

THE latest telephone idea is to utilize it in connection with train service. By means of a "hanging set," consisting of spliced rods with a cross arm at the top which can be dropped upon the pole line alongside the track, telephone connection can be established with every point on the line; and, in case of a wreck or blockade, information can at once be conveyed, orders can be sent by the dispatcher or superintendent, and the safety and facility of train movement can thus be increased.

THE scientific result of the experiments in electric canal towing at Tanawanda, New York, is that it was shown that by means of the Lamb system, which is nothing but a trolley car suspended from a wire, and to which may be attached the tow-line of canal boats, it is possible to move by electric power a tow of canal boats at a rate varying according to the current from four to five miles an hour, and at a cost considerably cheaper than that which mule or horse power now entails.

ON the 7th inst., Lord Rayleigh and Professor William Ramsey visited the the United States Embassy at London, where James Roosevelt, the secretary of the United States Embassy, presented them with a check for $10,000 which the Smithsonian Institute has awarded them as the first Hodgkin prize for their paper on argon, the new element discovered by them.

PROFESSOR LINDE is reported to be successful in putting to practical application the researches of Professor Dewar in regard to liquid air, which he proposes to utilize for the construction of a refrigerating system far in advance for economy and efficiency of anything in existence.

Mechanical Progress.

Magnetic Iron Ore.

By degrees metallurgists are finding ways of utilizing ores of iron which were once considered worthless. For a long time those containing a certain amount of phosphorus were without commercial value, for it was not then feasible to eliminate that impurity. The basic process now does so readily. A class of iron ores abundant in the South and on this coast are composed of magnetic iron mixed with silica, a substance which is melted with great difficulty. It is this characteristic of silica which makes it so valuable a compound of firebrick. But by crushing a magnetic iron ore tolerably fine, and feeding it into a magnetic separator, the part which it is desirable to obtain can be freed from its more refractory associate. It is then smelted in a furnace like any other ore and cast into pigs.

Now that the iron industries of the country are once more booming, the trade papers recall some interesting experiments made in 1892 and 1893 at Cranberry, in western North Carolina, where magnetic iron is obtained. These tests indicate that if the ore be crushed very fine part of the iron is lost by washing. Frank Firmstone, who conducted the investigation, recommends, therefore, that attention be paid to careful washing, screening and sorting into sizes, rather than to extreme pulverization, and that the several sizes (from 3-16 to 1¾-inch kernels) be collected separately by suitable magnetic apparatus. By good management he believes that such ores can be mined and worked profitably.

Telephones on Railway Trains.

A telephone attachment for railroad use has been introduced which will greatly increase the safety of railway travel. At present, the device is designed only for communication between the conductors and the nearest station, but the intention is to so modify it that it can be used by passengers traveling on express trains. By this arrangement the telephone can be called into requisition by the train dispatcher in addition to the telegraph dispatch wires, while on the other hand, the dispatcher can be called by any station or block along the line in a second. An ingenious part of the equipment is what is called a hanging set, which is to be carried in every baggage car and caboose. Should the train come to a standstill through a block, a wreck, or or any other interruption the hanging set, consisting of spliced rods with a cross arm at the top, is dropped on two wires on the pole line alongside the track. This gives a perfect connection as if the telephone were in a private office, and it will work along every foot of a railway line. In case of a wreck the telephone is instantly available, the dispatcher is called and orders are sent direct to the spot in return.

Tells the Story of the Track.

On the Boston & Albany railroad is a car like an ordinary parlor car, but bearing the name of no railroad, and having along the top of the car the words "Dynagraph and Track Indicator," the famous track indicator of P. H. Sedley, a machine which does the work of hundreds of men, and by means of which a number of important improvements in rail-building and matters of that nature have been introduced. After this machine has been run over a line of road there is an exact record on paper of the condition of every rail, and every foot of track on that road, and the machine is so perfect that it will record imperfections that are not apparent to the eye.

The operating department of the car takes up about half of it; there is a table for figuring, cabinets in which the records of the different roads are kept, and the dynagraph itself, which occupies a space of about four feet square. The keystone of the whole thing is the six-wheeled truck on which the end of the car rests. The wheels on this truck are constantly kept in perfect condition. The middle wheel on each side moves up and down in guides, over any of the imperfections of the track, and by this the dynagraph is operated. The top of the dynagraph is a flat table, over which a long roll of paper is run, being wound up again on the other side. The indicators which map out the condition of the track, rest on this paper and are connected with the moving wheel of the truck by mechanism which shows the slightest motion of the car or rails. The indicator arms are six inches long, projecting out over the paper. At the outer end of these arms are hollow glass points, like the points of a stylographic pen, filled with different colored inks and resting upon the paper, so that as the arms move in response to the movements of the car or trucks, the points trace out exact reproductions of these movements on the paper. There is an indicator for each of the rails, another to show unusual deflections of the rails, which indicates that the roadbed under them needs filling, and others to show the side motion or rolling of the car, the pressure on the two rails, and height of the different rails on curves.
